> When AWS recovers your instance due to an underlying hardware or software issue, be aware of the following consequences: data stored in volatile memory (RAM) and on instance store volumes will be lost, and the operating system's uptime will start over from zero. To help protect against data loss, we recommend that you regularly create backups of valuable data. For more information about backup and recovery best practices for EC2 instances, see Best practices for Amazon EC2.
> Automatic instance recovery mechanisms are designed for *individual instances*. For guidance on building a resilient *system*, see Build a resilient system.

Requirements for enabling CloudWatch action based recovery

CloudWatch action based recovery can be enabled on instances that meet the following criteria:

Instance types

- **General purpose:** A1, M3, M4, M5, M5a, M5n, M5zn, M6a, M6g, M6i, M6in, M7a, M7g, M7i, M7i-flex, M8a, M8azn, M8g, M8gb, M8gn, M8i, M8i-flex, M8in, M8ine, M8ib, M9g, T1, T2, T3, T3a, T4g, T8i
- **Compute optimized:** C3, C4, C5, C5a, C5n, C6a, C6g, C6gn, C6i, C6in, C7a, C7g, C7gn, C7i, C7i-flex, C8a, C8g, C8gb, C8gn, C8i, C8i-flex, C8in, C8ine, C8ib, C9g
- **Memory optimized:** R3, R4, R5, R5a, R5b, R5n, R6a, R6g, R6i, R6in, R7a, R7g, R7i, R7iz, R8a, R8g, R8gb, R8gn, R8i, R8i-flex, R8in, R8ib, R9g, U-3tb1, U-6tb1, U-9tb1, U-12tb1, U-18tb1, U-24tb1, U7i-6tb, U7i-8tb, U7i-12tb, U7in-16tb, U7in-24tb, U7in-32tb, U7inh-32tb, X1, X1e, X2idn, X2iedn, X2iezn, X8g, X8i

- **Accelerated computing:** G3, G5g, Inf1, P3, VT1
- **High-performance computing:** Hpc6a, Hpc7a, Hpc7g, Hpc8a
- **Metal instances:** Any of the above instance types with the metal instance size.
- **If instance store volumes are added at launch:** Then only the following instance types are supported: M3, C3, R3, X1, X1e, X2idn, X2iedn

Tenancy

- Shared
- Dedicated Instance

For more information, see Amazon EC2 Dedicated Instances.

Limitations

CloudWatch action based recovery is not supported for instances with the following characteristics:

- Tenancy: Dedicated Host. For Dedicated Hosts, use Dedicated Host Auto Recovery instead.
- Networking: Instances using an Elastic Fabric Adapter
- Auto Scaling: Instances that are part of an Auto Scaling group
- Maintenance: Instances currently undergoing a scheduled maintenance event

Find a supported instance type

You can view the instance types that support CloudWatch action based recovery.

Console

To view the instance types that support CloudWatch action based recovery

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Instance Types**.
3. In the filter bar, add the filter **Auto Recovery support = true**. The **Instance types** table displays all the instance types that support CloudWatch action based recovery.
4. (Optional) Add filters to further scope to specific instance types of interest.

AWS CLI

To view the instance types that support CloudWatch action based recovery

Use the describe-instance-types command with the `auto-recovery-supported` filter.

```
aws ec2 describe-instance-types \
    --filters Name=auto-recovery-supported,Values=true \
    --query "InstanceTypes[*].[InstanceType]" \
    --output text | sort
```

PowerShell

To view the instance types that support CloudWatch action based recovery

Use the Get-EC2InstanceType cmdlet with the `auto-recovery-supported` filter.

```
Get-EC2InstanceType `
    -Filter @{Name="auto-recovery-supported";Values="true"} | `
    Select InstanceType | Sort-Object InstanceType
```

Configure CloudWatch action based recovery

To configure CloudWatch action based recovery for an EC2 instance, create a CloudWatch alarm that monitors the `StatusCheckFailed_System` metric for the specified instance. Set the alarm to trigger when the metric value is **1**, indicating a failed system status check. Configure the alarm action to automatically recover the instance when triggered.

You can configure the alarm using either the Amazon EC2 console or the CloudWatch console. For the instructions, see Add recover actions to Amazon CloudWatch alarms in this user guide, or Adding recover actions to Amazon CloudWatch alarms in the *Amazon CloudWatch User Guide*.

Troubleshoot CloudWatch action based recovery failures

If CloudWatch action based recovery fails to recover your instance, consider the following issues:

- AWS service events are running

  CloudWatch action based recovery does not operate during service events in the AWS Health Dashboard. You might not receive recovery failure notifications for such events. For the latest service availability information, see the Service health status page.

- Insufficient capacity

  There is temporarily insufficient replacement hardware to migrate the instance.
- Maximum daily recovery attempts reached

  The instance has reached the maximum daily allowance for recovery attempts. Your instance might subsequently be retired if automatic recovery fails and a hardware degradation is determined to be the root cause of the original failed system status check.

If the instance's system status check failure persists despite multiple recovery attempts, see Troubleshoot instances with failed status checks for additional guidance.

Use instance metadata to manage your EC2 instance

Instance metadata is data about your instance that you can use to configure or manage the running instance. Instance metadata includes the following:

Instance metadata properties

Instance metadata properties are divided into categories, for example, host name, events, and security groups.

Dynamic data

Dynamic data is metadata that's generated when the instance is launched, such as an instance identity document. For more information, see Dynamic data categories.

User data

You can also use instance metadata to access *user data* that you specified when you launched your instance. For example, you can specify parameters for configuring your instance, or include a simple script. You can also build generic AMIs and use user data to modify the configuration files supplied at launch time. For example, if you run web servers for various small businesses, they can all use the same generic AMI and retrieve their content from an Amazon S3 bucket that you specify in the user data at launch. To add a new customer at any time, create a bucket for the customer, add their content, and launch your AMI with the unique bucket name provided to your code in the user data. If you launch multiple instances using the same `RunInstances` call, the user data is available to all instances in that reservation. Each instance that is part of the same reservation has a unique `ami-launch-index` number, so that you can write code that controls what the instances do. For example, the first host might elect itself as the original

node in a cluster. For a detailed AMI launch example, see Identify each instance launched in a single request.

Important

Although you can only access instance metadata and user data from within the instance itself, the data is not protected by authentication or cryptographic methods. Anyone who has direct access to the instance, and potentially any software running on the instance, can view its metadata. Therefore, you should not store sensitive data, such as passwords or long-lived encryption keys, as user data.

Contents

- Instance metadata categories
- Dynamic data categories
- Access instance metadata for an EC2 instance
- Configure the Instance Metadata Service options
- Run commands when you launch an EC2 instance with user data input
- Identify each instance launched in a single request

Instance metadata categories

Instance metadata properties are divided into categories. To retrieve instance metadata properties, you specify the category in the request, and the metadata is returned in the response.

When new categories are released, a new instance metadata build is created with a new version number. In the following table, the **Version when category was released** column specifies the build version when an instance metadata category was released. To avoid having to update your code every time Amazon EC2 releases a new instance metadata build, use `latest` instead of the version number in your metadata requests. For more information, see Get the available versions of the instance metadata.

When Amazon EC2 releases a new instance metadata category, the instance metadata for the new category might not be available for existing instances. With Nitro-based instances, you can retrieve instance metadata only for the categories that were available at launch. For instances with the Xen

hypervisor, you can stop and then start the instance to update the categories that are available for the instance.

The following table lists the categories of instance metadata. Some of the category names include placeholders for data that is unique to your instance. For example, *mac* represents the MAC address for the network interface. You must replace the placeholders with actual values when you retrieve the instance metadata.

Category	Description	Version when category was released
ami-id	The AMI ID used to launch the instance.	1.0
ami-launch-index	If you launch multiple instances using the same RunInstances call, this value indicates the launch order for each instance. The value of the first instance launched is 0. If you launch instances using Auto Scaling or EC2 fleet, this value is always 0.	1.0
ami-manifest-path	The path to the AMI manifest file in Amazon S3. If you used an Amazon EBS-backed AMI to launch the instance, the returned result is unknown.	1.0
ancestor-ami-ids	The AMI IDs of any instances that were rebundled to create this AMI. This value will only exist if the AMI manifest file contained an ancestor-amis key.	2007-10-10
autoscaling/target-lifecycle-state	Value showing the target Auto Scaling lifecycle state that an Auto Scaling instance is	2021-07-15

Category	Description	Version when category was released
	transitioning to. Present when the instance transitions to one of the target lifecycle states after March 10, 2022. Possible values: `Detached` | `InService` | `Standby` | `Terminated` | `Warmed:Hibernated` | `Warmed:Running` | `Warmed:Stopped` | `Warmed:Terminated` . See Retrieve the target lifecycle state through instance metadata in the *Amazon EC2 Auto Scaling User Guide*.	
`block-device-mapping/ami`	The virtual device that contains the root/boot file system.	2007-12-15
`block-device-mapping/ebs`*N*	The virtual devices associated with any Amazon EBS volumes. Amazon EBS volumes are only available in metadata if they were present at launch time or when the instance was last started. The *N* indicates the index of the Amazon EBS volume (such as `ebs1` or `ebs2`).	2007-12-15

Category	Description	Version when category was released
`block-device-mapping/ephemeral` *N*	The virtual devices for any non-NVMe instance store volumes. The *N* indicates the index of each volume. The number of instance store volumes in the block device mapping might not match the actual number of instance store volumes for the instance. The instance type determines the number of instance store volumes that are available to an instance. If the number of instance store volumes in a block device mapping exceeds the number available to an instance, the additional instance store volumes are ignored.	2007-12-15
`block-device-mapping/root`	The virtual devices or partitions associated with the root devices or partitions on the virtual device, where the root (/ or C:) file system is associated with the given instance.	2007-12-15
`block-device-mapping/swap`	The virtual devices associated with `swap`. Not always present.	2007-12-15
`events/maintenance/history`	If there are completed or canceled maintenance events for the instance, contains a JSON string with information about the events.	2018-08-17

Category	Description	Version when category was released
`events/maintenance/scheduled`	If there are active maintenance events for the instance, contains a JSON string with informati on about the events. For more information, see View scheduled events that affect your Amazon EC2 instances.	2018-08-17
`events/recommendations/rebalance`	The approximate time, in UTC, when the EC2 instance rebalance recommendation notification is emitted for the instance. The following is an example of the metadata for this category: `{"noticeTime": "2020-11-05T08:22:00Z"}` . This category is available only after the notification is emitted. For more information, see EC2 instance rebalance recommend ations.	2020-10-27

Category	Description	Version when category was released
`hostname`	If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). For more information about IPBN and RBN, see EC2 instance hostnames and domains.	1.0
`iam/info`	If there is an IAM role associated with the instance, contains information about the last time the instance profile was updated, including the instance's LastUpdated date, InstanceProfileArn, and InstanceProfileId. Otherwise, not present.	2012-01-12
`iam/security-credentials/role-name`	If there is an IAM role associated with the instance, *`role-name`* is the name of the role, and *`role-name`* contains the temporary security credentials associated with the role (for more information, see Retrieve security credentials from instance metadata). Otherwise, not present.	2012-01-12

Category	Description	Version when category was released
`identity-credentials/ec2/info`	Information about the credentials in `identity-credentials/ec2/security-credentials/ec2-instance` .	2018-05-23
`identity-credentials/ec2/security-credentials/ec2-instance`	Credentials for the instance identity role that allow on-instance software to identify itself to AWS to support features such as EC2 Instance Connect and AWS Systems Manager Default Host Management Configuration. These credentials have no policies attached, so they have no additional AWS API permissions beyond identifying the instance to the AWS feature. For more information, see Instance identity roles for Amazon EC2 instances.	2018-05-23
`instance-action`	Notifies the instance that it should reboot in preparation for bundling. Valid values: none | `shutdown` | `bundle-pending` .	2008-09-01
`instance-id`	The ID of this instance.	1.0
`instance-life-cycle`	The purchasing option of this instance. For more information, see Amazon EC2 billing and purchasing options.	2019-10-01
`instance-type`	The type of instance. For more information, see Amazon EC2 instance types.	2007-08-29

Category	Description	Version when category was released
ipv6	The IPv6 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0) network interface and the first IPv6 address assigned. If no IPv6 address exists on network interface[0], this item is not set and results in an HTTP 404 response.	2021-01-03
kernel-id	The ID of the kernel launched with this instance, if applicable.	2008-02-01
local-hostname	In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If the EC2 instance is using IP-based naming (IPBN), this is the private IPv4 DNS hostname of the instance. If the EC2 instance is using Resource-based naming (RBN), this is the RBN. For more information about IPBN, RBN, and EC2 instance naming, see EC2 instance hostnames and domains.	2007-01-19

Category	Description	Version when category was released
`local-ipv4`	The private IPv4 address of the instance. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0). If this is an IPv6-only instance, this item is not set and results in an HTTP 404 response.	1.0
`mac`	The instance's media access control (MAC) address. In cases where multiple network interfaces are present, this refers to the eth0 device (the device for which the device number is 0).	2011-01-01
`metrics/vhostmd`	No longer available.	2011-05-01
`network/interfaces/macs/mac/device-number`	The unique device number associated with that interface. The device number corresponds to the device name; for example, a `device-number` of 2 is for the eth2 device. This category corresponds to the `DeviceIndex` and `device-index` fields that are used by the Amazon EC2 API and the EC2 commands for the AWS CLI.	2011-01-01
`network/interfaces/macs/mac/interface-id`	The ID of the network interface.	2011-01-01

Category	Description	Version when category was released
network/interfaces/macs/mac/ipv4-associations/public-ip	The private IPv4 addresses that are associated with each public IP address and assigned to that interface.	2011-01-01
network/interfaces/macs/mac/ipv6s	The IPv6 addresses assigned to the interface.	2016-06-30
network/interfaces/macs/mac/ipv6-prefix	The IPv6 prefix assigned to the network interface.	
network/interfaces/macs/mac/local-hostname	The private IPv4 DNS hostname of the network interface. This value is not set for interfaces with no IP addresses at all, such as EFA-only interfaces. If this is an IPv6-only interface, this is the resource-based name. For more information about IPBN and RBN, see EC2 instance hostnames and domains.	2007-01-19
network/interfaces/macs/mac/local-ipv4s	The private IPv4 addresses associated with the interface. If this is an IPv6-only network interface, this item is not set and results in an HTTP 404 response.	2011-01-01
network/interfaces/macs/mac/mac	The instance's MAC address.	2011-01-01
network/interfaces/macs/*mac*/network-card	The index of the network card. Some instance types support multiple network cards.	2020-11-01

Category	Description	Version when category was released
`network/interfaces/macs/mac/owner-id`	The ID of the owner of the network interface. In multiple-interface environments, an interface can be attached by a third party, such as Elastic Load Balancing. Traffic on an interface is always billed to the interface owner.	2011-01-01
`network/interfaces/macs/mac/public-hostname`	The interface's public DNS (IPv4). This category is only returned if the `enableDnsHostnames` attribute is set to `true`. For more information, see DNS attributes for your VPC in the *Amazon VPC User Guide*. If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2011-01-01
`network/interfaces/macs/mac/public-ipv4s`	The public IP address or Elastic IP addresses associated with the interface. There may be multiple IPv4 addresses on an instance.	2011-01-01
`network/interfaces/macs/mac/security-groups`	Security groups to which the network interface belongs.	2011-01-01
`network/interfaces/macs/mac/security-group-ids`	The IDs of the security groups to which the network interface belongs.	2011-01-01

Category	Description	Version when category was released
network/interfaces/macs/mac/subnet-id	The ID of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv4-cidr-block	The IPv4 CIDR block of the subnet in which the interface resides.	2011-01-01
network/interfaces/macs/mac/subnet-ipv6-cidr-blocks	The IPv6 CIDR block of the subnet in which the interface resides.	2016-06-30
network/interfaces/macs/mac/vpc-id	The ID of the VPC in which the interface resides.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-block	The primary IPv4 CIDR block of the VPC.	2011-01-01
network/interfaces/macs/mac/vpc-ipv4-cidr-blocks	The IPv4 CIDR blocks for the VPC.	2016-06-30
network/interfaces/macs/mac/vpc-ipv6-cidr-blocks	The IPv6 CIDR block of the VPC in which the interface resides.	2016-06-30
placement/availability-zone	The Availability Zone in which the instance launched.	2008-02-01
placement/availability-zone-id	The static Availability Zone ID in which the instance is launched. The Availability Zone ID is consistent across accounts. However, it might be different from the Availability Zone, which can vary by account.	2019-10-01

Category	Description	Version when category was released
`placement/group-name`	The name of the placement group in which the instance is launched.	2020-08-24
`placement/host-id`	The ID of the host on which the instance is launched. Applicable only to Dedicated Hosts.	2020-08-24
`placement/partition-number`	The number of the partition in which the instance is launched.	2020-08-24
`placement/region`	The AWS Region in which the instance is launched.	2020-08-24
`product-codes`	AWS Marketplace product codes associated with the instance, if any.	2007-03-01
`public-hostname`	The instance's public DNS (IPv4). This category is only returned if the `enableDnsHostnames` attribute is set to `true`. For more information, see DNS attributes for your VPC in the *Amazon VPC User Guide*. If the instance only has a public-IPv6 address and no public-IPv4 address, this item is not set and results in an HTTP 404 response.	2007-01-19
`public-ipv4`	The public IPv4 address. If an Elastic IP address is associated with the instance, the value returned is the Elastic IP address.	2007-01-19

Category	Description	Version when category was released
`public-keys/0/openssh-key`	Public key. Only available if supplied at instance launch time.	1.0
`ramdisk-id`	The ID of the RAM disk specified at launch time, if applicable.	2007-10-10
`reservation-id`	The ID of the reservation.	1.0
`security-groups`	The names of the security groups applied to the instance. After launch, you can change the security groups of the instances. Such changes are reflected here and in network/interfaces/macs/*mac*/security-groups.	1.0
`services/domain`	The domain for AWS resources for the Region.	2014-02-25
`services/partition`	The partition that the resource is in. For standard AWS Regions, the partition is `aws`. If you have resources in other partitions, the partition is `aws-`*`partition name`*. For example, the partition for resources in the China (Beijing) Region is `aws-cn`.	2015-10-20

Category	Description	Version when category was released
spot/instance-action	The action (hibernate, stop, or terminate) and the approximate time, in UTC, when the action will occur. This item is present only if the Spot Instance has been marked for hibernate, stop, or terminate. For more information, see instance-action.	2016-11-15
spot/termination-time	The approximate time, in UTC, that the operating system for your Spot Instance will receive the shutdown signal. This item is present and contains a time value (for example, 2015-01-05T18:02:00Z) only if the Spot Instance has been marked for termination by Amazon EC2. The termination-time item is not set to a time if you terminated the Spot Instance yourself. For more information, see termination-time.	2014-11-05
system	The underlying virtualization type (hypervisor) of the instance.	2022-09-24
tags/instance	The instance tags associated with the instance. Only available if you explicitly allow access to tags in instance metadata. For more information, see Enable access to tags in instance metadata.	2021-03-23

Dynamic data categories

The following table lists the categories of dynamic data.

Category	Description	Version when category was released
`fws/instance-monitoring`	Value showing whether the customer has enabled detailed one-minute monitoring in CloudWatch. Valid values: `enabled | disabled`	2009-04-04
`instance-identity/document`	JSON containing instance attributes, such as instance-id, private IP address, and more. See Instance identity documents for Amazon EC2 instances.	2009-04-04
`instance-identity/pkcs7`	Used to verify the document's authenticity and content against the signature. See Instance identity documents for Amazon EC2 instances.	2009-04-04
`instance-identity/signature`	Data that can be used by other parties to verify its origin and authenticity. See Instance identity documents for Amazon EC2 instances.	2009-04-04

Access instance metadata for an EC2 instance

You can access EC2 instance metadata from inside of the instance itself or from the EC2 console, API, SDKs, or the AWS CLI. To get the current instance metadata settings for an instance from the console or command line, see Query instance metadata options for existing instances.

You can also modify user data for instances with an EBS root volume. The instance must be in the stopped state. For console directions, see Update the instance user data. For a Linux example that uses the AWS CLI, see modify-instance-attribute. For a Windows example that uses the Tools for Windows PowerShell, see the section called “User data and the Tools for Windows PowerShell”.

> **Note**
>
> You are not billed for HTTP requests used to retrieve instance metadata and user data.

Instance metadata access considerations

To avoid problems with instance metadata, consider the following.

Instance launch failures due to IMDSv2 enforcement (`HttpTokensEnforced=enabled`)

Before enabling IMDSv2 enforcement, you need all your software on the instance to support IMDSv2, after which you can change the default to disable IMDSv1 (`httpTokens=required`), after which you can enable enforcement. For more information, Transition to using Instance Metadata Service Version 2.

Command format

The command format is different, depending on whether you use Instance Metadata Service Version 1 (IMDSv1) or Instance Metadata Service Version 2 (IMDSv2). By default, you can use both versions of the Instance Metadata Service. To require the use of IMDSv2, see Use the Instance Metadata Service to access instance metadata.

If IMDSv2 is required, IMDSv1 does not work

If you use IMDSv1 and receive no response, it's likely that IMDSv2 is required. To check whether IMDSv2 is required, select the instance to view its details. The **IMDSv2** value indicates either **Required** (you must use IMDSv2) or **Optional** (you can use either IMDSv2 or IMDSv1).

(IMDSv2) Use /latest/api/token to retrieve the token

Issuing PUT requests to any version-specific path, for example `/2021-03-23/api/token`, results in the metadata service returning 403 Forbidden errors. This behavior is intended.

Metadata version

To avoid having to update your code every time Amazon EC2 releases a new instance metadata build, we recommend that you use `latest` in the path, and not the version number.

IPv6 support

To retrieve instance metadata using an IPv6 address, ensure that you enable and use the IPv6 address of the IMDS `[fd00:ec2::254]` instead of the IPv4 address `169.254.169.254`. The instance must be a Nitro-based instance launched in a subnet that supports IPv6.

(Windows) Create custom AMIs using Windows Sysprep

To ensure that IMDS works when you launch an instance from a custom Windows AMI, the AMI must be a standardized image created with Windows Sysprep. Otherwise, the IMDS won't work. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.

In a container environment, consider reconfiguration or increasing the hop limit to 2

The AWS SDKs use IMDSv2 calls by default. If the IMDSv2 call receives no response, some AWS SDKs retry the call and, if still unsuccessful, use IMDSv1. This can result in a delay, especially in a container environment. For those AWS SDKs that *require* IMDSv2, if the hop limit is 1 in a container environment, the call might not receive a response at all because going to the container is considered an additional network hop.

To mitigate these issues in a container environment, consider changing the configuration to pass settings (such as the AWS Region) directly to the container, or consider increasing the hop limit to 2. For information about the hop limit impact, see Add defense in depth against open firewalls, reverse proxies, and SSRF vulnerabilities with enhancements to the EC2 Instance Metadata Service. For information about changing the hop limit, see Change the PUT response hop limit.

Packets per second (PPS) limit

There is a 1024 packet per second (PPS) limit to services that use link-local addresses. This limit includes the aggregate of Route 53 Resolver DNS Queries, Instance Metadata Service (IMDS) requests, Amazon Time Service Network Time Protocol (NTP) requests, and Windows Licensing Service (for Microsoft Windows based instances) requests.

Additional considerations for user data access

- User data is treated as opaque data: what you specify is what you get back upon retrieval. It is up to the instance to interpret and act on user data.
- User data must be base64-encoded. Depending on the tool or SDK that you're using, the base64-encoding might be performed for you. For example:
  - The Amazon EC2 console can perform the base64-encoding for you or accept base64-encoded input.
  - AWS CLI version 2 performs base64-encoding of binary parameters for you by default. AWS CLI version 1 performs the base64-encoding of the `--user-data` parameter for you.

- The AWS SDK for Python (Boto3) performs base64-encoding of the `UserData` parameter for you.
- User data is limited to 16 KB, in raw form, before it is base64-encoded. The size of a string of length *n* after base64-encoding is ceil(*n*/3)*4.
- User data must be base64-decoded when you retrieve it. If you retrieve the data using instance metadata or the console, it's decoded for you automatically.
- If you stop an instance, modify its user data, and start the instance, the updated user data is not run automatically when you start the instance. With Windows instances, you can configure settings so that updated user data scripts are run one time when you start the instance or every time you reboot or start the instance.
- User data is an instance attribute. If you create an AMI from an instance, the instance user data is not included in the AMI.

Access instance metadata from within an EC2 instance

Because your instance metadata is available from your running instance, you do not need to use the Amazon EC2 console or the AWS CLI. This can be helpful when you're writing scripts to run from your instance. For example, you can access the local IP address of your instance from instance metadata to manage a connection to an external application.

All of the following are considered instance metadata, but they are accessed in different ways. Select the tab that represents the type of instance metadata you want to access to see more information.

Metadata

Instance metadata properties are divided into categories. For a description of each instance metadata category, see Instance metadata categories.

To access instance metadata properties from within a running instance, get the data from the following IPv4 or IPv6 URIs. These IP addresses are link-local addresses and are valid only from the instance. For more information, see Link-local addresses.

IPv4

```
http://169.254.169.254/latest/meta-data/
```

IPv6

```
http://[fd00:ec2::254]/latest/meta-data/
```

Dynamic data

To retrieve dynamic data from within a running instance, use one of the following URIs.

IPv4

```
http://169.254.169.254/latest/dynamic/
```

IPv6

```
http://[fd00:ec2::254]/latest/dynamic/
```

Examples: Access with cURL

The following examples use cURL to retrieve the high-level instance identity categories.

IMDSv2

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-
aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/dynamic/
instance-identity/
rsa2048
pkcs7
document
signature
dsa2048
```

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/dynamic/instance-identity/
rsa2048
pkcs7
document
signature
dsa2048
```

Examples: Access with PowerShell

The following examples use PowerShell to retrieve the high-level instance identity categories.

IMDSv2

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method
 GET -Uri http://169.254.169.254/latest/dynamic/instance-identity/
document
rsa2048
pkcs7
signature
```

IMDSv1

```
PS C:\> Invoke-RestMethod -uri http://169.254.169.254/latest/dynamic/instance-identity/
document
rsa2048
pkcs7
signature
```

For more information about dynamic data and examples of how to retrieve it, see Instance identity documents for Amazon EC2 instances.

User data

To retrieve user data from an instance, use one of the following URIs. To retrieve user data using the IPv6 address, you must enable it, and the instance must be a Nitro-based instance in a subnet that supports IPv6.

IPv4

```
http://169.254.169.254/latest/user-data
```

IPv6

```
http://[fd00:ec2::254]/latest/user-data
```

A request for user data returns the data as it is (content type `application/octet-stream`). If the instance does not have any user data, the request returns `404 - Not Found`.

Examples: Access with cURL to retrieve comma-separated text

The following examples use cURL to retrieve user data that was specified as comma-separated text.

IMDSv2

```
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/user-data
1234,john,reboot,true | 4512,richard, | 173,,,
```

IMDSv1

```
curl http://169.254.169.254/latest/user-data
1234,john,reboot,true | 4512,richard, | 173,,,
```

Examples: Access with PowerShell to retrieve comma-separated text

The following examples use PowerShell to retrieve user data that was specified as comma-separated text.

IMDSv2

```
[string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri http://169.254.169.254/latest/user-data
1234,john,reboot,true | 4512,richard, | 173,,,
```

IMDSv1

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} `
```

```
-Method PUT -Uri http://169.254.169.254/latest/api/token} -Method GET -uri
 http://169.254.169.254/latest/user-data
1234,john,reboot,true | 4512,richard, | 173,,,
```

Examples: Access with cURL to retrieve a script

The following examples use cURL to retrieve user data that was specified as a script.

IMDSv2

```
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-
token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/user-
data
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

IMDSv1

```
curl http://169.254.169.254/latest/user-data
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

Examples: Access with PowerShell to retrieve a script

The following examples use PowerShell to retrieve user data that was specified as a script.

IMDSv2

```
[string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds"
 = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -Uri
 http://169.254.169.254/latest/user-data
<powershell>
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
New-Item $file -ItemType file
```

```
</powershell>
<persist>true</persist>
```

IMDSv1

```
Invoke-RestMethod -uri http://169.254.169.254/latest/user-data
<powershell>
$file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

Query instance metadata options for existing instances

You can query the instance metadata options for your existing instances.

Console

To query the instance metadata options for an existing instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance and check the following fields:
   - **IMDSv2** – The value is either **Required** or **Optional**.
   - **Allow tags in instance metadata** – The value is either **Enabled** or **Disabled**.
4. With your instance selected, choose **Actions**, **Instance settings**, **Modify instance metadata options**.

   The dialog box displays whether the instance metadata service is enabled or disabled for the selected instance.

AWS CLI

To query the instance metadata options for an existing instance

Use the describe-instances command.

```
aws ec2 describe-instances \
```

```
    --instance-id i-1234567898abcdef0 \
    --query 'Reservations[].Instances[].MetadataOptions'
```

PowerShell

To query the instance metadata options for an existing instance using the Tools for PowerShell

Use the Get-EC2Instance cmdlet.

```
(Get-EC2Instance `
    -InstanceId i-1234567898abcdef0).Instances.MetadataOptions
```

Responses and error messages

All instance metadata is returned as text (HTTP content type `text/plain`).

A request for a specific metadata resource returns the appropriate value, or a `404 - Not Found` HTTP error code if the resource is not available.

A request for a general metadata resource (the URI ends with a /) returns a list of available resources, or a `404 - Not Found` HTTP error code if there is no such resource. The list items are on separate lines, terminated by line feeds (ASCII 10).

If an IMDSv1 request receives no response, it's likely that IMDSv2 is required.

For requests made using IMDSv2, the following HTTP error codes can be returned:

- `400 - Missing or Invalid Parameters` – The PUT request is not valid.
- `401 - Unauthorized` – The GET request uses an invalid token. The recommended action is to generate a new token.
- `403 - Forbidden` – The request is not allowed or the IMDS is turned off.
- `404 - Not Found` – The resource is not available or there is no such resource.
- `503` – The request could not be completed. Retry the request.

If the IMDS returns an error, **curl** prints the error message in the output and returns a success status code. The error message is stored in the `TOKEN` variable, which causes **curl** commands that use the

token to fail. If you call **curl** with the **-f** option, it returns an error status code in the event of an HTTP server error. If you enable error handling, the shell can catch the error and stop the script.

Query throttling

We throttle queries to the IMDS on a per-instance basis, and we place limits on the number of simultaneous connections from an instance to the IMDS.

If you're using the IMDS to retrieve AWS security credentials, avoid querying for credentials during every transaction or concurrently from a high number of threads or processes, as this might lead to throttling. Instead, we recommend that you cache the credentials until they start approaching their expiry time. For more information about IAM role and security credentials associated with the role, see Retrieve security credentials from instance metadata.

If you are throttled while accessing the IMDS, retry your query with an exponential backoff strategy.

Use the Instance Metadata Service to access instance metadata

You can access instance metadata from a running instance using one of the following methods:

- Instance Metadata Service Version 2 (IMDSv2) – a session-oriented method

  For examples, see Examples for IMDSv2.
- Instance Metadata Service Version 1 (IMDSv1) – a request/response method

  For examples, see Examples for IMDSv1.

By default, you can use either IMDSv1 or IMDSv2, or both.

You can configure the Instance Metadata Service (IMDS) on each instance to only accept IMDSv2 calls, which will cause IMDSv1 calls to fail. For information about how to configure your instance to use IMDSv2, see Configure the Instance Metadata Service options.

The PUT or GET headers are unique to IMDSv2. If these headers are present in the request, then the request is intended for IMDSv2. If no headers are present, it is assumed the request is intended for IMDSv1.

For an extensive review of IMDSv2, see Add defense in depth against open firewalls, reverse proxies, and SSRF vulnerabilities with enhancements to the EC2 Instance Metadata Service.

Topics

- How Instance Metadata Service Version 2 works
- Use a supported AWS SDK
- Examples for IMDSv2
- Examples for IMDSv1

How Instance Metadata Service Version 2 works

IMDSv2 uses session-oriented requests. With session-oriented requests, you create a session token that defines the session duration, which can be a minimum of one second and a maximum of six hours. During the specified duration, you can use the same session token for subsequent requests. After the specified duration expires, you must create a new session token to use for future requests.

> **Note**
>
> The examples in this section use the IPv4 address of the Instance Metadata Service (IMDS): `169.254.169.254`. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: `[fd00:ec2::254]`. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on Nitro-based instances in an IPv6-supported subnet (dual stack or IPv6 only).

The following examples use a shell script and IMDSv2 to retrieve the top-level instance metadata items. Each example:

- Creates a session token lasting six hours (21,600 seconds) using the PUT request
- Stores the session token header in a variable named `TOKEN` (Linux instances) or `token` (Windows instances)
- Requests the top-level metadata items using the token

Linux example

You can run two separate commands, or combine them.

Separate commands

First, generate a token using the following command.

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-
ec2-metadata-token-ttl-seconds: 21600"`
```

Then, use the token to generate top-level metadata items using the following command.

```
[ec2-user ~]$ curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
meta-data/
```

Combined commands

You can store the token and combine the commands. The following example combines the above two commands and stores the session token header in a variable named TOKEN.

> **Note**
>
> If there is an error in creating the token, instead of a valid token, an error message is stored in the variable, and the command will not work.

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-
ec2-metadata-token-ttl-seconds: 21600"` \
 && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/
```

After you've created a token, you can reuse it until it expires. In the following example command, which gets the ID of the AMI used to launch the instance, the token that is stored in `$TOKEN` in the previous example is reused.

```
[ec2-user ~]$ curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
meta-data/ami-id
```

Windows example

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-
seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method GET -
Uri http://169.254.169.254/latest/meta-data/
```

After you've created a token, you can reuse it until it expires. In the following example command, which gets the ID of the AMI used to launch the instance, the token that is stored in `$token` in the previous example is reused.

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} `
 -Method GET -uri http://169.254.169.254/latest/meta-data/ami-id
```

When you use IMDSv2 to request instance metadata, the request must include the following:

1. Use a PUT request to initiate a session to the instance metadata service. The PUT request returns a token that must be included in subsequent GET requests to the instance metadata service. The token is required to access metadata using IMDSv2.
2. Include the token in all GET requests to the IMDS. When token usage is set to `required`, requests without a valid token or with an expired token receive a `401 - Unauthorized` HTTP error code.
   - The token is an instance-specific key. The token is not valid on other EC2 instances and will be rejected if you attempt to use it outside of the instance on which it was generated.
   - The PUT request must include a header that specifies the time to live (TTL) for the token, in seconds, up to a maximum of six hours (21,600 seconds). The token represents a logical session. The TTL specifies the length of time that the token is valid and, therefore, the duration of the session.
   - After a token expires, to continue accessing instance metadata, you must create a new session using another PUT.
   - You can choose to reuse a token or create a new token with every request. For a small number of requests, it might be easier to generate and immediately use a token each time you need to access the IMDS. But for efficiency, you can specify a longer duration for the token and reuse it rather than having to write a PUT request every time you need to request instance metadata. There is no practical limit on the number of concurrent tokens, each representing its own session. IMDSv2 is, however, still constrained by normal IMDS connection and throttling limits. For more information, see Query throttling.

HTTP GET and HEAD methods are allowed in IMDSv2 instance metadata requests. PUT requests are rejected if they contain an X-Forwarded-For header.

By default, the response to PUT requests has a response hop limit (time to live) of 1 at the IP protocol level. If you need a bigger hop limit, you can adjust it by using the modify-instance-

metadata-options AWS CLI command. For example, you might need a bigger hop limit for backward compatibility with container services running on the instance. For more information, see Modify instance metadata options for existing instances.

Use a supported AWS SDK

To use IMDSv2, your EC2 instances must use an AWS SDK version that supports using IMDSv2. The latest versions of all the AWS SDKs support using IMDSv2.

> **Important**
>
> We recommend that you to stay up to date with SDK releases to keep up with the latest features, security updates, and underlying dependencies. Continued use of an unsupported SDK version is not recommended and is done at your discretion. For more information, see the AWS SDKs and Tools maintenance policy in the *AWS SDKs and Tools Reference Guide*.

The following are the minimum versions that support using IMDSv2:

- AWS CLI – 1.16.289
- AWS Tools for Windows PowerShell – 4.0.1.0
- AWS SDK for .NET – 3.3.634.1
- AWS SDK for C++ – 1.7.229
- AWS SDK for Go – 1.25.38
- AWS SDK for Go v2 – 0.19.0
- AWS SDK for Java – 1.11.678
- AWS SDK for Java 2.x – 2.10.21
- AWS SDK for JavaScript in Node.js – 2.722.0
- AWS SDK for Kotlin – 1.1.4
- AWS SDK for PHP – 3.147.7
- Botocore (the low-level library underlying the AWS SDK for Python (Boto3) and the AWS CLI) – 1.13.25
- AWS SDK for Python (Boto3) – 1.12.6
- AWS SDK for Ruby – 3.79.0

Examples for IMDSv2

Run the following examples on your Amazon EC2 instance to retrieve the instance metadata for IMDSv2.

On Windows instances, you can use Windows PowerShell or you can install cURL or wget. If you install a third-party tool on a Windows instance, ensure that you read the accompanying documentation carefully, as the calls and the output might be different from what is described here.

Examples

- Get the available versions of the instance metadata
- Get the top-level metadata items
- Get the values for metadata items
- Get the list of available public keys
- Show the formats in which public key 0 is available
- Get public key 0 (in the OpenSSH key format)
- Get the subnet ID for an instance
- Get the instance tags for an instance

Get the available versions of the instance metadata

This example gets the available versions of the instance metadata. Each version refers to an instance metadata build when new instance metadata categories were released. The instance metadata build versions do not correlate with the Amazon EC2 API versions. The earlier versions are available to you in case you have scripts that rely on the structure and information present in a previous version.

cURL

```

ip-10-251-50-12.ec2.internal
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method
 GET -Uri http://169.254.169.254/latest/meta-data/public-hostname
ec2-203-0-113-25.compute-1.amazonaws.eu
```

Get the list of available public keys

This example gets the list of available public keys.

cURL

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/public-keys/
0=my-public-key
```

PowerShell

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method
 GET -Uri http://169.254.169.254/latest/meta-data/public-keys/
0=my-public-key
```

Show the formats in which public key 0 is available

This example shows the formats in which public key 0 is available.

cURL

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/public-keys/0/
openssh-key
```

PowerShell

```
PS C:\> [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds" = "21600"} -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
PS C:\> Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} -Method
 GET -Uri http://169.254.169.254/latest/meta-data/public-keys/0/openssh-key
```

```
openssh-key
```

Get public key 0 (in the OpenSSH key format)

This example gets public key 0 (in the OpenSSH key format).

Get the instance tags for an instance

If access to instance tags in the instance metadata is turned on, you can get the tags for a instance from instance metadata. For more information, see Retrieve tags from instance metadata.

Examples for IMDSv1

Run the following examples on your Amazon EC2 instance to retrieve the instance metadata for IMDSv1.

On Windows instances, you can use Windows PowerShell or you can install cURL or wget. If you install a third-party tool on a Windows instance, ensure that you read the accompanying documentation carefully, as the calls and the output might be different from what is described here.

Examples

- Get the available versions of the instance metadata
- Get the top-level metadata items
- Get the values for metadata items
- Get the list of available public keys
- Show the formats in which public key 0 is available
- Get public key 0 (in the OpenSSH key format)
- Get the subnet ID for an instance
- Get the instance tags for an instance

Get the available versions of the instance metadata

This example gets the available versions of the instance metadata. Each version refers to an instance metadata build when new instance metadata categories were released. The instance metadata build versions do not correlate with the Amazon EC2 API versions. The earlier versions are available to you in case you have scripts that rely on the structure and information present in a previous version.

Get the instance tags for an instance

If access to instance tags in the instance metadata is turned on, you can get the tags for a instance from instance metadata. For more information, see Retrieve tags from instance metadata.

Transition to using Instance Metadata Service Version 2

If you want to configure your instances to only accept Instance Metadata Service Version 2 (IMDSv2) calls, we recommend that you use the following tools and transition path.

Topics

- Tools for transitioning to IMDSv2
- Recommended path to requiring IMDSv2

Tools for transitioning to IMDSv2

The following tools can help you identify, monitor, and manage the transition of your software from IMDSv1 to IMDSv2. For the instructions on how to use these tools, see Recommended path to requiring IMDSv2.

AWS software

The latest versions of the AWS CLI and AWS SDKs support IMDSv2. To use IMDSv2, update your EC2 instances to use the latest versions. For the minimum AWS SDK versions that support IMDSv2, see Use a supported AWS SDK.

All Amazon Linux 2 and Amazon Linux 2023 software packages support IMDSv2. Amazon Linux 2023 disables IMDSv1 by default.

IMDS Packet Analyzer

IMDS Packet Analyzer is an open-source tool that identifies and logs IMDSv1 calls during your instance's boot phase and runtime operations. By analyzing these logs, you can precisely identify the software making IMDSv1 calls on your instances and determine what needs to be updated to support IMDSv2 only on your instances. You can run IMDS Packet Analyzer from a command line or install it as a service. For more information, see AWS ImdsPacketAnalyzer on *GitHub*.

CloudWatch

CloudWatch provides the following two metrics for monitoring your instances:

`MetadataNoToken` – IMDSv2 uses token-backed sessions, while IMDSv1 does not. The `MetadataNoToken` metric tracks the number of calls to the Instance Metadata Service (IMDS) that are using IMDSv1. By tracking this metric to zero, you can determine if and when all of your software has been upgraded to use IMDSv2.

`MetadataNoTokenRejected` – After you've disabled IMDSv1, you can use the `MetadataNoTokenRejected` metric to track the number of times an IMDSv1 call was attempted and rejected. By tracking this metric, you can ascertain whether your software needs to be updated to use IMDSv2.

For each EC2 instance, these metrics are mutually exclusive. When IMDSv1 is enabled (`httpTokens = optional`), only `MetadataNoToken` emits. When IMDSv1 is disabled (`httpTokens = required`), only `MetadataNoTokenRejected` emits. For when to use these metrics, see Recommended path to requiring IMDSv2.

For more information, see Instance metrics.

Launch APIs

New instances: Use the RunInstances API to launch new instances that require the use of IMDSv2. For more information, see Configure instance metadata options for new instances.

Existing instances: Use the ModifyInstanceMetadataOptions API to require the use of IMDSv2 on existing instances. For more information, see Modify instance metadata options for existing instances.

New instances launched by Auto Scaling groups: To require the use of IMDSv2 on all new instances launched by Auto Scaling groups, your Auto Scaling groups can use either a launch template or a launch configuration. When you create a launch template or create a launch

configuration, you must configure the `MetadataOptions` parameters to require the use of IMDSv2. The Auto Scaling group launches new instances using the new launch template or launch configuration, but existing instances are not affected.

Existing instances in an Auto Scaling group: Use the ModifyInstanceMetadataOptions API to require the use of IMDSv2 on existing instances, or terminate the instances and the Auto Scaling group will launch new replacement instances with the instance metadata options settings that are defined in the new launch template or launch configuration.

AMIs

AMIs configured with the `ImdsSupport` parameter set to `v2.0` will launch instances that require IMDSv2 by default. Amazon Linux 2023 is configured with `ImdsSupport = v2.0`.

New AMIs: Use the register-image CLI command to set the `ImdsSupport` parameter to `v2.0` when creating a new AMI.

Existing AMIs: Use the modify-image-attribute CLI command to set the `ImdsSupport` parameter to `v2.0` when modifying an existing AMI.

For more information, see Configure the AMI.

Account-level controls

You can configure default values for all the instance metadata options at the account level. The default values are automatically applied when you launch an instance. For more information. see Set IMDSv2 as the default for the account.

You can also enforce the requirement to use IMDSv2 at the account level. When IMDSv2 enforcement is enabled:

- **New instances:** Instances configured to launch with IMDSv1 enabled will fail to launch
- **Existing instances with IMDSv1 disabled:** Attempts to enable IMDSv1 on existing instances will be prevented.
- **Existing instances with IMDSv1 enabled:** Existing instances with IMDSv1 already enabled will not be affected.

For more information, see Enforce IMDSv2 at the account level.

IAM policies and SCPs

You can use an IAM policy or AWS Organizations service control policy (SCP) to control users as follows:

- Can't launch an instance using the RunInstances API unless the instance is configured to use IMDSv2.
- Can't modify an existing instance using the ModifyInstanceMetadataOptions API to re-enable IMDSv1.

The IAM policy or SCP must contain the following IAM condition keys:

- `ec2:MetadataHttpEndpoint`
- `ec2:MetadataHttpPutResponseHopLimit`
- `ec2:MetadataHttpTokens`

If a parameter in the API or CLI call doesn't match the state specified in the policy that contains the condition key, the API or CLI call fails with an `UnauthorizedOperation` response.

Furthermore, you can choose an additional layer of protection to enforce the change from IMDSv1 to IMDSv2. At the access management layer with respect to the APIs called through EC2 Role credentials, you can use a condition key in either IAM policies or AWS Organizations service control policies (SCPs). Specifically, by using the condition key `ec2:RoleDelivery` with a value of `2.0` in your IAM policies, API calls made with EC2 Role credentials obtained from IMDSv1 will receive an `UnauthorizedOperation` response. The same thing can be achieved more broadly with that condition required by an SCP. This ensures that credentials delivered through IMDSv1 cannot actually be used to call APIs because any API calls not matching the specified condition will receive an `UnauthorizedOperation` error.

For example IAM policies, see Work with instance metadata. For more information on SCPs, see Service control policies in the *AWS Organizations User Guide*.

Declarative Policies

Use Declarative Policies (a feature of AWS Organizations) to centrally set IMDS account defaults, including IMDSv2 enforcement, across your organization. For an example policy, see the **Instance Metadata** tab in the Supported declarative policies section in the *AWS Organizations User Guide*.

Recommended path to requiring IMDSv2

Using the above tools, we recommend the following path for transitioning to IMDSv2:

- Step 1: Identify instances with IMDSv2=optional and audit IMDSv1 usage

- Step 2: Update software to IMDSv2
- Step 3: Require IMDSv2 on instances
- Step 4: Set IMDSv2=required as the default
- Step 5: Enforce instances to require IMDSv2

Step 1: Identify instances with IMDSv2=optional and audit IMDSv1 usage

To assess your IMDSv2 migration scope, identify instances that are configured to allow either IMDSv1 or IMDSv2, and audit IMDSv1 calls.

1. **Identify instances that are configured to allow either IMDSv1 or IMDSv2:**

   Amazon EC2 console

   1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
   2. In the navigation pane, choose **Instances**.
   3. To see only the instances that are configured to allow IMDSv1 or IMDSv2, add the filter **IMDSv2 = optional**.
   4. Alternatively, to see whether IMDSv2 is **optional** or **required** for all instances, open the **Preferences** window (gear icon), toggle on **IMDSv2**, and choose **Confirm**. This adds the **IMDSv2** column to the **Instances** table.

   AWS CLI

   Use the describe-instances command and filter by `metadata-options.http-tokens = optional`, as follows:

   ```
   aws ec2 describe-instances --filters "Name=metadata-options.http-
   tokens,Values=optional" --query "Reservations[*].Instances[*].[InstanceId]" --
   output text
   ```

2. **Audit IMDSv1 calls on each instance:**

   Use the CloudWatch metric `MetadataNoToken`. This metric shows the number of IMDSv1 calls to the IMDS on your instances. For more information, see Instance metrics.

3. **Identify software on your instances making IMDSv1 calls:**

Use the open source IMDS Packet Analyzer to identify and log IMDSv1 calls during your instance's boot phase and runtime operations. Use this information to identify the software to update to get your instances ready to use IMDSv2 only. You can run IMDS Packet Analyzer from a command line or install it as a service.

Step 2: Update software to IMDSv2

Update all SDKs, CLIs, and software that use Role credentials on your instances to IMDSv2-compatible versions. For more information about updating the CLI, see Installing or updating to the latest version of the AWS CLI in the *AWS Command Line Interface User Guide*.

Step 3: Require IMDSv2 on instances

After confirming zero IMDSv1 calls through the `MetadataNoToken` metric, configure your existing instances to require IMDSv2. Also, configure all new instances to require IMDSv2. In other words, disable IMDSv1 on all existing and new instances.

1. **Configure existing instances to require IMDSv2:**

   Amazon EC2 console

   1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
   2. In the navigation pane, choose **Instances**.
   3. Select your instance.
   4. Choose **Actions**, **Instance settings**, **Modify instance metadata options**.
   5. For **IMDSv2**, choose **Required**.
   6. Choose **Save**.

   AWS CLI

   Use the modify-instance-metadata-options CLI command to specify that only IMDSv2 is to be used.

> **Note**
>
> You can modify this setting on running instances. The change takes effect immediately without needing an instance restart.

For more information, see Require the use of IMDSv2.

2. **Monitor for issues after disabling IMDSv1:**

   1. Track the number of times an IMDSv1 call was attempted and rejected with the `MetadataNoTokenRejected` CloudWatch metric.
   2. If the `MetadataNoTokenRejected` metric records IMDSv1 calls on an instance that is experiencing software issues, this indicates that the software requires updating to use IMDSv2.

3. **Configure new instances to require IMDSv2:**

   Amazon EC2 console

   1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
   2. Follow the steps to launch an instance.
   3. Expand **Advanced details**, and for **Metadata version**, choose **V2 only (token required)**.
   4. In the **Summary panel**, review your instance configuration, and then choose **Launch instance**.

      For more information, see Configure the instance at launch.

   AWS CLI

   AWS CLI: Use the run-instances command and specify that IMDSv2 is required.

Step 4: Set IMDSv2=required as the default

You can set IMDSv2=required as the default configuration at either the account or organization level. This ensures that all newly launched instances are automatically configured to require IMDSv2.

1. **Set account-level default:**

   Amazon EC2 console

   1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
   2. In the navigation pane, choose **Dashboard**.
   3. On the **Account attributes** card, under **Settings**, choose **Data protection and security**.
   4. Under **IMDS defaults**, choose **Manage**.
   5. For **Instance metadata service** , choose **Enabled**.
   6. For **Metadata version**, choose to **V2 only (token required)**.
   7. Choose **Update**.

   AWS CLI

   Use the modify-instance-metadata-defaults CLI command and specify `--http-tokens required` and `--http-put-response-hop-limit 2`.

   For more information, see Set IMDSv2 as the default for the account.

2. **Alternatively, set organization-level default using a Declarative Policy:**

   Use a Declarative Policy to set the organization default for IMDSv2 to required. For an example policy, see the **Instance Metadata** tab in the Supported declarative policies section in the *AWS Organizations User Guide*.

Step 5: Enforce instances to require IMDSv2

After you've confirmed that there is no dependency on IMDSv1 on any of your instances, we recommend that you enforce IMDSv2 on all new instances.

Use one of the following options to enforce IMDSv2:

1. **Enforce IMDSv2 with an account property**

   You can enforce the use of IMDSv2 at the account level for each AWS Region. When enforced, instances can only launch if they're configured to require IMDSv2. This enforcement applies regardless of how the instance or AMI is configured. For more information, see Enforce IMDSv2 at the account level. To apply this setting at an organization level, set a Declarative Policy. For an example policy, see the **Instance Metadata** tab in the Supported declarative policies section in the *AWS Organizations User Guide*.

   To prevent a reversal of enforcement, you should use an IAM policy to prevent access to the ModifyInstanceMetadataDefaults API. For more information, see Use an IAM policy.

   > **Note**
   >
   > This setting does not change the IMDS version of existing instances, but blocks enabling IMDSv1 on existing instances that currently have IMDSv1 disabled.

   > **Warning**
   >
   > If IMDSv2 enforcement is enabled and `httpTokens` is not set to `required` in either the instance configuration at launch, the account settings, or the AMI configuration, the instance launch will fail. For troubleshooting information, see Launching an IMDSv1-enabled instance fails.

2. **Alternatively, enforce IMDSv2 by using the following IAM or SCP condition keys:**

   - `ec2:MetadataHttpTokens`
   - `ec2:MetadataHttpPutResponseHopLimit`
   - `ec2:MetadataHttpEndpoint`

   These condition keys control the use of the RunInstances and the ModifyInstanceMetadataOptions APIs and corresponding CLIs. If a policy is created, and a parameter in the API call does not match the state specified in the policy using the condition key, the API or CLI call fails with an `UnauthorizedOperation` response.

   For example IAM policies, see Work with instance metadata.

Limit access to the Instance Metadata Service

You can consider using local firewall rules to disable access from some or all processes to the Instance Metadata Service (IMDS).

For Nitro-based instances, the IMDS can be reached from your own network when a network appliance within your VPC, such as a virtual router, forwards packets to the IMDS address, and the default source/destination check on the instance is disabled. To prevent a source from outside your VPC reaching the IMDS, we recommend that you modify the configuration of the network appliance to drop packets with the destination IPv4 address of the IMDS `169.254.169.254` and, if you enabled the IPv6 endpoint, the IPv6 address of the IMDS `[fd00:ec2::254]`.

Limit IMDS access for Linux instances

Using iptables to limit access

The following example uses Linux iptables and its `owner` module to prevent the Apache webserver (based on its default installation user ID of `apache`) from accessing 169.254.169.254. It uses a *deny rule* to reject all instance metadata requests (whether IMDSv1 or IMDSv2) from any process running as that user.

```
$ sudo iptables --append OUTPUT --proto tcp --destination 169.254.169.254 --match owner
 --uid-owner apache --jump REJECT
```

Or, you can consider only allowing access to particular users or groups, by using *allow rules*. Allow rules might be easier to manage from a security perspective, because they require you to make a decision about what software needs access to instance metadata. If you use *allow rules*, it's less likely you will accidentally allow software to access the metadata service (that you did not intend to have access) if you later change the software or configuration on an instance. You can also combine group usage with allow rules, so that you can add and remove users from a permitted group without needing to change the firewall rule.

The following example prevents access to the IMDS by all processes, except for processes running in the user account `trustworthy-user`.

```
$ sudo iptables --append OUTPUT --proto tcp --destination 169.254.169.254 --match
 owner ! --uid-owner trustworthy-user --jump REJECT
```

Note

- To use local firewall rules, you need to adapt the preceding example commands to suit your needs.
- By default, iptables rules are not persistent across system reboots. They can be made to be persistent by using OS features, not described here.
- The iptables `owner` module only matches group membership if the group is the primary group of a given local user. Other groups are not matched.

Using PF or IPFW to limit access

If you are using FreeBSD or OpenBSD, you can also consider using PF or IPFW. The following examples limit access to the IMDS to just the root user.

PF

```
$ block out inet proto tcp from any to 169.254.169.254
```

```
$ pass out inet proto tcp from any to 169.254.169.254 user root
```

IPFW

```
$ allow tcp from any to 169.254.169.254 uid root
```

```
$ deny tcp from any to 169.254.169.254
```

Note

The order of the PF and IPFW commands matter. PF defaults to last matching rule and IPFW defaults to first matching rule.

Limit IMDS access for Windows instances

Using Windows firewall to limit access

The following PowerShell example uses the built-in Windows firewall to prevent the Internet Information Server webserver (based on its default installation user ID of `NT AUTHORITY\IUSR`) from accessing 169.254.169.254. It uses a *deny rule* to reject all instance metadata requests (whether IMDSv1 or IMDSv2) from any process running as that user.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount ("NT
 AUTHORITY\IUSR")
PS C:\> $BlockPrincipalSID =
 $blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $BlockPrincipalSDDL = "D:(A;;CC;;;$BlockPrincipalSID)"
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service from IIS" -Action
 block -Direction out `
-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $BlockPrincipalSDDL
```

Or, you can consider only allowing access to particular users or groups, by using *allow rules*. Allow rules might be easier to manage from a security perspective, because they require you to make a decision about what software needs access to instance metadata. If you use *allow rules*, it's less likely you will accidentally allow software to access the metadata service (that you did not intend to have access) if you later change the software or configuration on an instance. You can also combine group usage with allow rules, so that you can add and remove users from a permitted group without needing to change the firewall rule.

The following example prevents access to instance metadata by all processes running as an OS group specified in the variable `blockPrincipal` (in this example, the Windows group `Everyone`), except for processes specified in `exceptionPrincipal` (in this example, a group called `trustworthy-users`). You must specify both deny and allow principals because Windows Firewall, unlike the `! --uid-owner trustworthy-user` rule in Linux iptables, does not provide a shortcut mechanism to allow only a particular principal (user or group) by denying all the others.

```
PS C:\> $blockPrincipal = New-Object -TypeName System.Security.Principal.NTAccount
 ("Everyone")
PS C:\> $BlockPrincipalSID =
 $blockPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $exceptionPrincipal = New-Object -TypeName System.Security.Principal.NTAccount
 ("trustworthy-users")
PS C:\> $ExceptionPrincipalSID =
 $exceptionPrincipal.Translate([System.Security.Principal.SecurityIdentifier]).Value
PS C:\> $PrincipalSDDL = "O:LSD:(D;;CC;;;$ExceptionPrincipalSID)(A;;CC;;;
$BlockPrincipalSID)"
```

```
PS C:\> New-NetFirewallRule -DisplayName "Block metadata service for
 $($blockPrincipal.Value), exception: $($exceptionPrincipal.Value)" -Action block -
Direction out `
-Protocol TCP -RemoteAddress 169.254.169.254 -LocalUser $PrincipalSDDL
```

Note

To use local firewall rules, you need to adapt the preceding example commands to suit your needs.

Using netsh rules to limit access

You can consider blocking all software using `netsh` rules, but those are much less flexible.

```
C:\> netsh advfirewall firewall add rule name="Block metadata service altogether"
 dir=out protocol=TCP remoteip=169.254.169.254 action=block
```

Note

- To use local firewall rules, you need to adapt the preceding example commands to suit your needs.
- `netsh` rules must be set from an elevated command prompt, and can't be set to deny or allow particular principals.

Configure the Instance Metadata Service options

The Instance Metadata Service (IMDS) runs locally on every EC2 instance. The *instance metadata options* refer to a set of configurations that control the accessibility and behavior of the IMDS on an EC2 instance.

You can configure the following instance metadata options on each instance:

Instance metadata service (IMDS): `enabled` | `disabled`

You can enable or disable the IMDS on an instance. When disabled, you or any code won't be able to access the instance metadata on the instance.

The IMDS has two endpoints on an instance: IPv4 (`169.254.169.254`) and IPv6 (`[fd00:ec2::254]`). When you enable the IMDS, the IPv4 endpoint is automatically enabled. If you want to enable the IPv6 endpoint, you need to do so explicitly.

IMDS IPv6 endpoint: `enabled` | `disabled`

You can explicitly enable the IPv6 IMDS endpoint on an instance. When the IPv6 endpoint is enabled, the IPv4 endpoint remains enabled. The IPv6 endpoint is only supported on Nitro-based instances in IPv6-supported subnets (dual stack or IPv6 only).

Metadata version: `IMDSv1 or IMDSv2 (token optional)` | `IMDSv2 only (token required)`

When requesting instance metadata, IMDSv2 calls require a token. IMDSv1 calls do not require a token. You can configure an instance to allow either IMDSv1 or IMDSv2 calls (where a token is optional), or to only allow IMDSv2 calls (where a token is required).

Metadata response hop limit: `1–64`

The hop limit is the number of network hops that the PUT response is allowed to make. You can set the hop limit to a minimum of 1 and a maximum of 64. In a container environment, a hop limit of 1 can cause issues. For information about how to mitigate these issues, see the information about container environments under Instance metadata access considerations.

Access to tags in instance metadata: `enabled` | `disabled`

You can enable or disable access to the instance's tags from an instance's metadata. For more information, see View tags for your EC2 instances using instance metadata.

To view an instance's current configuration, see Query instance metadata options for existing instances.

Where to configure instance metadata options

Instance metadata options can be configured at different levels, as follows:

- **Account** – You can set default values for the instance metadata options at the account level for each AWS Region. When an instance is launched, the instance metadata options are automatically set to the account-level values. You can change these values at launch. Account-level default values do not affect existing instances.

- **AMI** – You can set the `imds-support` parameter to `v2.0` when you register or modify an AMI. When an instance is launched with this AMI, the instance metadata version is automatically set to IMDSv2 and the hop limit is set to 2.
- **Instance** – You can change all the instance metadata options on an instance at launch, overriding the default settings. You can also change the instance metadata options after launch on a running or stopped instance. Note that changes may be restricted by an IAM or SCP policy.

For more information, see Configure instance metadata options for new instances and Modify instance metadata options for existing instances.

Order of precedence for instance metadata options

The value for each instance metadata option is determined at instance launch, following a hierarchical order of precedence. The hierarchy, with the highest precedence at the top, is as follows:

- **Precedence 1: Instance configuration at launch** – Values can be specified either in the launch template or in the instance configuration. Any values specified here override values specified at the account level or in the AMI.
- **Precedence 2: Account settings** – If a value is not specified at instance launch, then it is determined by the account-level settings (which are set for each AWS Region). Account-level settings either include a value for each metadata option, or indicate no preference at all.
- **Precedence 3: AMI configuration** – If a value is not specified at instance launch or at the account level, then it is determined by the AMI configuration. This applies only to `HttpTokens` and `HttpPutResponseHopLimit`.

Each metadata option is evaluated separately. The instance can be configured with a mix of direct instance configuration, account-level defaults, and the configuration from the AMI.

You can change the value of any metadata option after launch on a running or stopped instance, unless changes are restricted by an IAM or SCP policy.

> **Note**
>
> The account-level IMDSv2 enforcement setting is evaluated after the order of precedence has determined the instance's IMDS settings. When IMDSv2 enforcement is enabled,

instances enabled with IMDSv1 will fail. For more information about enforcement, see Enforce IMDSv2 at the account level.

Warning

If IMDSv2 enforcement is enabled and `httpTokens` has not been set to `required` in either the instance configuration at launch, the account settings, or the AMI configuration, your launch will fail.

Example 1 – Determine values for metadata options

In this example, an EC2 instance is launched into a Region where the `HttpPutResponseHopLimit` is set to 1 at the account level. The specified AMI has `ImdsSupport` set to `v2.0`. No metadata options are specified directly on the instance at launch. The instance is launched with the following metadata options:

```
"MetadataOptions": {
    ...
    "HttpTokens": "required",
    "HttpPutResponseHopLimit": 1,
    ...
```

These values were determined as follows:

- **No metadata options specified at launch:** During the launch of the instance, specific values for the metadata options were not provided either in the instance launch parameters or in the launch template.
- **Account settings take next precedence:** In the absence of specific values specified at launch, the settings at the account level within the Region take precedence. This means that the default values configured at the account level are applied. In this case, the `HttpPutResponseHopLimit` was set to 1.
- **AMI settings take last precedence:** In the absence of a specific value specified at launch or at the account level for `HttpTokens` (the instance metadata version), the AMI setting is applied. In this case, the AMI setting `ImdsSupport: v2.0` determined that `HttpTokens` was set to `required`. Note that while the AMI setting `ImdsSupport: v2.0` is designed

to set HttpPutResponseHopLimit: 2, it was overridden by the account-level setting HttpPutResponseHopLimit: 1, which has higher precedence.

Example 2 – Determine values for metadata options

In this example, the EC2 instance is launched with the same settings as in the previous Example 1, but with HttpTokens set to optional directly on the instance at launch. The instance is launched with the following metadata options:

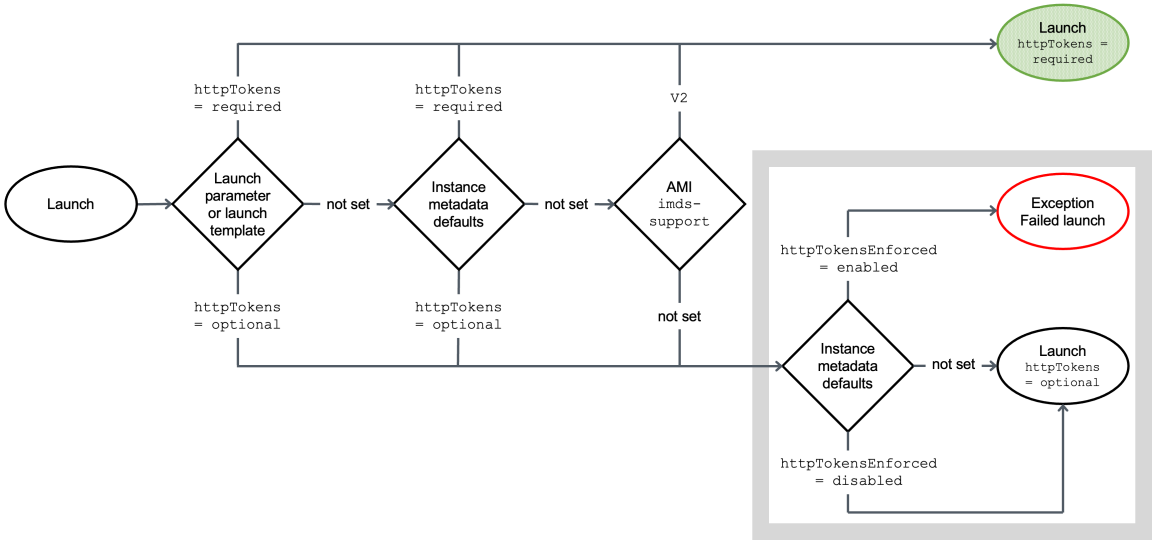
```
"MetadataOptions": {
    ...
    "HttpTokens": "optional",
    "HttpPutResponseHopLimit": 1,
    ...
```

The value for HttpPutResponseHopLimit is determined in the same way as in Example 1. However, the value for HttpTokens is determined as follows: Metadata options configured on the instance at launch take first precedence. Even though the AMI was configured with ImdsSupport: v2.0 (in other words, HttpTokens is set to required), the value specified on the instance at launch (HttpTokens set to optional) took precedence.

Example 3 – Determine values for metadata options with HttpTokensEnforced enabled

In this example, the account in the Region has HttpTokens = required and HttpTokensEnforced = enabled.

Consider the following EC2 instance launch attempts:



- Launch attempt with HttpTokens set to optional – The launch fails because the account-level enforcement is enabled (HttpTokensEnforced = enabled) and the launch parameter takes precedence over the account default.
- Launch attempt with HttpTokens set to required – The launch succeeds because it complies with the account-level enforcement.
- Launch attempt with no HttpTokens value specified – The launch succeeds because the value defaults to required based on the account settings.

Set the instance metadata version

When an instance is launched, the value for the instance *metadata version* is either **IMDSv1 or IMDSv2 (token optional)** (`httpTokens=optional`) or **IMDSv2 only (token required) (`httpTokens=required`)** .

At instance launch, you can either manually specify the value for the metadata version, or use the default value. If you manually specify the value, it overrides any defaults. If you opt not to manually specify the value, it will be determined by a combination of default settings.

The following flowchart shows how the metadata version for an instance at launch is determined by the settings at the different levels of the configuration and where enforcement is evaluated. The table that follows provides the specific settings at each level.

The table shows how the metadata version for an instance at launch (indicated by **Resulting instance configuration** in column 4) is determined by the settings at the different levels of configuration. The order of precedence is from left to right, where the first column takes the highest precedence, as follows:

- Column 1: **Launch parameter** – Represents the setting on the instance that you manually specify at launch.
- Column 2: **Account level default** – Represents the setting for the account.
- Column 3: **AMI default** – Represents the setting on the AMI.

Launch parameter	Account level default	AMI default	Resulting instance configuration
V2 only (token required)	No preference	V2 only	V2 only
V2 only (token required)	V2 only	V2 only	V2 only
V2 only (token required)	V1 or V2	V2 only	V2 only
V1 or V2 (token optional)	No preference	V2 only	V1 or V2
V1 or V2 (token optional)	V2 only	V2 only	V1 or V2
V1 or V2 (token optional)	V1 or V2	V2 only	V1 or V2
Not set	No preference	V2 only	V2 only
Not set	V2 only	V2 only	V2 only
Not set	V1 or V2	V2 only	V1 or V2
V2 only (token required)	No preference	null	V2 only
V2 only (token required)	V2 only	null	V2 only
V2 only (token required)	V1 or V2	null	V2 only
V1 or V2 (token optional)	No preference	null	V1 or V2

Launch parameter	Account level default	AMI default	Resulting instance configuration
V1 or V2 (token optional)	V2 only	null	V1 or V2
V1 or V2 (token optional)	V1 or V2	null	V1 or V2
Not set	No preference	null	V1 or V2
Not set	V2 only	null	V2 only
Not set	V1 or V2	null	V1 or V2

Use IAM condition keys to restrict instance metadata options

You can use IAM condition keys in an IAM policy or SCP as follows:

- Allow an instance to launch only if it's configured to require the use of IMDSv2
- Restrict the number of allowed hops
- Turn off access to instance metadata

Tasks

- Configure instance metadata options for new instances
- Modify instance metadata options for existing instances

> **Note**
>
> You should proceed cautiously and conduct careful testing before making any changes. Take note of the following:
>
> - If you enforce the use of IMDSv2, applications or agents that use IMDSv1 for instance metadata access will break.
> - If you turn off all access to instance metadata, applications or agents that rely on instance metadata access to function will break.

- For IMDSv2, you must use `/latest/api/token` when retrieving the token.
- (Windows only) If your PowerShell version is earlier than 4.0, you must update to Windows Management Framework 4.0 to require the use of IMDSv2.

Configure instance metadata options for new instances

You can configure the following instance metadata options for new instances.

Options

- Require the use of IMDSv2
- Enable the IMDS IPv4 and IPv6 endpoints
- Turn off access to instance metadata
- Allow access to tags in instance metadata

Note

The settings for these options are configured at the account level, either directly in the account or by using a declarative policy. They must be configured in each AWS Region where you want to configure instance metadata options. Using a declarative policy allows you to apply the settings across multiple Regions simultaneously, as well as across multiple accounts simultaneously. When a declarative policy is in use, you can't modify the settings directly within an account. This topic describes how to configure the settings directly within an account. For information about using declarative policies, see Declarative policies in the *AWS Organizations User Guide.*

Require the use of IMDSv2

You can use the following methods to require the use of IMDSv2 on your new instances.

To require IMDSv2

- Set IMDSv2 as the default for the account
- Enforce IMDSv2 at the account level
- Configure the instance at launch

- Configure the AMI
- Use an IAM policy

Set IMDSv2 as the default for the account

You can set the default version for the instance metadata service (IMDS) at the account level for each AWS Region. This means that when you launch a *new* instance, the instance metadata version is automatically set to the account-level default. However, you can manually override the value at launch or after launch. For more information about how the account-level settings and manual overrides affect an instance, see Order of precedence for instance metadata options.

> **Note**
>
> Setting the account-level default does not reset *existing* instances. For example, if you set the account-level default to IMDSv2, any existing instances that are set to IMDSv1 are not affected. If you want to change the value on existing instances, you must manually change the value on the instances themselves.

You can set the account default for the instance metadata version to IMDSv2 so that all *new* instances in the account launch with IMDSv2 required, and IMDSv1 will be disabled. With this account default, when you launch an instance, the following are the default values for the instance:

- Console: **Metadata version** is set to **V2 only (token required)** and **Metadata response hop limit** is set to **2**.
- AWS CLI: `HttpTokens` is set to `required` and `HttpPutResponseHopLimit` is set to 2.

> **Note**
>
> Before setting the account default to IMDSv2, ensure that your instances do not depend on IMDSv1. For more information, see Recommended path to requiring IMDSv2.

Console

To set IMDSv2 as the default for the account for the specified Region

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. To change the AWS Region, use the Region selector in the upper-right corner of the page.
3. In the navigation pane, choose **Dashboard**.
4. On the **Account attributes** card, under **Settings**, choose **Data protection and security**.
5. Next to **IMDS defaults**, choose **Manage**.
6. On the **Manage IMDS defaults** page, do the following:

    a. For **Instance metadata service**, choose **Enabled**.

    b. For **Metadata version**, choose **V2 only (token required)**.

    c. For **Metadata response hop limit**, specify **2** if your instances will host containers. Otherwise, select **No preference**. When no preference is specified, at launch, the value defaults to **2** if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to **1**.

    d. Choose **Update**.

AWS CLI

To set IMDSv2 as the default for the account for the specified Region

Use the modify-instance-metadata-defaults command and specify the Region in which to modify the IMDS account level settings. Include `--http-tokens` set to `required` and `--http-put-response-hop-limit` set to 2 if your instances will host containers. Otherwise, specify `-1` to indicate no preference. When `-1` (no preference) is specified, at launch, the value defaults to 2 if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to 1.

```
aws ec2 modify-instance-metadata-defaults \
    --region us-east-1 \
    --http-tokens required \
    --http-put-response-hop-limit 2
```

The following is example output.

```
{
    "Return": true
}
```

To view the default account settings for the instance metadata options for the specified Region

Use the get-instance-metadata-defaults command and specify the Region.

```
aws ec2 get-instance-metadata-defaults --region us-east-1
```

The following is example output.

```
{
    "AccountLevel": {
        "HttpTokens": "required",
        "HttpPutResponseHopLimit": 2
    },
    "ManagedBy": "account"
}
```

The `ManagedBy` field indicates the entity that configured the settings. In this example, `account` indicates that the settings were configured directly in the account. A value of `declarative-policy` would mean the settings were configured by a declarative policy. For more information, see Declarative policies in the *AWS Organizations User Guide*.

To set IMDSv2 as the default for the account for all Regions

Use the modify-instance-metadata-defaults command to modify the IMDS account level settings for all Regions. Include `--http-tokens` set to `required` and `--http-put-response-hop-limit` set to 2 if your instances will host containers. Otherwise, specify `-1` to indicate no preference. When `-1` (no preference) is specified, at launch, the value defaults to 2 if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to 1.

```
echo -e "Region          \t Modified" ; \
echo -e "--------------  \t ---------" ; \
for region in $(
    aws ec2 describe-regions \
        --region us-east-1 \
        --query "Regions[*].[RegionName]" \
        --output text
    );
    do (output=$(
        aws ec2 modify-instance-metadata-defaults \
            --region $region \
            --http-tokens required \
            --http-put-response-hop-limit 2 \
            --output text)
```

```
        echo -e "$region        \t $output"
    );
done
```

The following is example output.

```
Region                  Modified
--------------          ---------
ap-south-1              True
eu-north-1              True
eu-west-3               True
...
```

To view the default account settings for the instance metadata options for all Regions

Use the get-instance-metadata-defaults command.

```
echo -e "Region   \t Level          Hops    HttpTokens" ; \
echo -e "-------------- \t ------------   ----    ----------" ; \
for region in $(
    aws ec2 describe-regions \
        --region us-east-1 \
        --query "Regions[*].[RegionName]" \
        --output text
    );
    do (output=$(
        aws ec2 get-instance-metadata-defaults \
            --region $region \
            --output text)
        echo -e "$region \t $output"
    );
done
```

The following is example output.

```
Region           Level          Hops    HttpTokens
--------------   ------------   ----    ----------
ap-south-1       ACCOUNTLEVEL   2       required
eu-north-1       ACCOUNTLEVEL   2       required
eu-west-3        ACCOUNTLEVEL   2       required
...
```

PowerShell

To set IMDSv2 as the default for the account for the specified Region

Use the Edit-EC2InstanceMetadataDefault cmdlet and specify the Region in which to modify the IMDS account level settings. Include `-HttpToken` set to `required` and `-HttpPutResponseHopLimit` set to 2 if your instances will host containers. Otherwise, specify `-1` to indicate no preference. When `-1` (no preference) is specified, at launch, the value defaults to 2 if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to 1.

```
Edit-EC2InstanceMetadataDefault `
    -Region us-east-1 `
    -HttpToken required `
    -HttpPutResponseHopLimit 2
```

The following is example output.

```
True
```

To view the default account settings for the instance metadata options for the specified Region

Use the Get-EC2InstanceMetadataDefault cmdlet and specify the Region.

```
Get-EC2InstanceMetadataDefault -Region us-east-1 | Format-List
```

The following is example output.

```
HttpEndpoint            :
HttpPutResponseHopLimit : 2
HttpTokens              : required
InstanceMetadataTags    :
```

To set IMDSv2 as the default for the account for all Regions

Use the Edit-EC2InstanceMetadataDefault cmdlet to modify the IMDS account level settings for all Regions. Include `-HttpToken` set to `required` and `-HttpPutResponseHopLimit` set to 2 if your instances will host containers. Otherwise, specify `-1` to indicate no preference. When

-1 (no preference) is specified, at launch, the value defaults to 2 if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to 1.

```
(Get-EC2Region).RegionName | `
    ForEach-Object {
    [PSCustomObject]@{
        Region   = $_
        Modified = (Edit-EC2InstanceMetadataDefault `
                -Region $_ `
                -HttpToken required `
                -HttpPutResponseHopLimit 2)
    }
} | `
Format-Table Region, Modified -AutoSize
```

Expected output

```
Region         Modified
------         --------
ap-south-1         True
eu-north-1         True
eu-west-3          True
...
```

To view the default account settings for the instance metadata options for all Regions

Use the Get-EC2InstanceMetadataDefault cmdlet.

```
(Get-EC2Region).RegionName | `
    ForEach-Object {
    [PSCustomObject]@{
        Region = $_
        HttpPutResponseHopLimit = (Get-EC2InstanceMetadataDefault -Region
 $_).HttpPutResponseHopLimit
        HttpTokens              = (Get-EC2InstanceMetadataDefault -Region
 $_).HttpTokens
    }
} | `
Format-Table -AutoSize
```

Example output

```
Region         HttpPutResponseHopLimit HttpTokens
------         ----------------------- ----------
ap-south-1                           2 required
eu-north-1                           2 required
eu-west-3                            2 required
...
```

Enforce IMDSv2 at the account level

You can enforce the use of IMDSv2 at the account level for each AWS Region. When enforced, instances can only launch if they're configured to require IMDSv2. This enforcement applies regardless of how the instance or AMI is configured.

> **Note**
>
> Before enabling IMDSv2 enforcement at the account level, ensure that your applications and AMIs support IMDSv2. For more information, see Recommended path to requiring IMDSv2. If IMDSv2 enforcement is enabled and `httpTokens` is not set to `required` in either the instance configuration at launch, the account settings, or the AMI configuration, the instance launch will fail. For troubleshooting information, see Launching an IMDSv1-enabled instance fails.

> **Note**
>
> This setting does not change the IMDS version of existing instances, but blocks enabling IMDSv1 on existing instances that currently have IMDSv1 disabled.

Console

To enforce IMDSv2 for the account in the specified Region

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. To change the AWS Region, use the Region selector in the top right corner of the page.
3. In the navigation pane, choose **Dashboard**.
4. On the **Account attributes** card, under **Settings**, choose **Data protection and security**.

5. Next to **IMDS defaults**, choose **Manage**.
6. On the **Manage IMDS defaults** page, do the following:
   a. For **Metadata version**, choose **V2 only (token required)**.
   b. For **Enforce IMDSv2**, choose **Enabled**.
   c. Choose **Update**.

AWS CLI

To enforce IMDSv2 for the account in the specified Region

Use the modify-instance-metadata-defaults command and specify the Region in which to enforce IMDSv2.

```
aws ec2 modify-instance-metadata-defaults \
    --region us-east-1 \
    --http-tokens required \
    --http-tokens-enforced enabled
```

The following is example output.

```
{
"Return": true
}
```

To view the IMDSv2 enforcement setting for the account in a specific Region

Use the get-instance-metadata-defaults command and specify the Region.

```
aws ec2 get-instance-metadata-defaults --region us-east-1
```

The following is example output.

```
{
    "AccountLevel": {
        "HttpTokens": "required",
        "HttpTokensEnforced": "enabled"
    },
```

```
    "ManagedBy": "account"
}
```

The `ManagedBy` field indicates the entity that configured the settings. In this example, `account` indicates that the settings were configured directly in the account. A value of `declarative-policy` would mean the settings were configured by a declarative policy. For more information, see Declarative policies in the *AWS Organizations User Guide*.

To enforce IMDSv2 for the account for all Regions

Use the modify-instance-metadata-defaults command to enforce IMDSv2 in all Regions.

```
echo -e "Region          \t Modified" ; \
echo -e "--------------  \t ---------" ; \
for region in $(
    aws ec2 describe-regions \
        --region us-east-1 \
        --query "Regions[*].[RegionName]" \
        --output text
    );
    do (output=$(
        aws ec2 modify-instance-metadata-defaults \
            --region $region \
            --http-tokens-enforced enabled \
            --output text)
        echo -e "$region        \t $output"
    );
done
```

The following is example output.

```
Region                  Modified
--------------          ---------
ap-south-1              True
eu-north-1              True
eu-west-3               True
...
```

To view the IMDSv2 enforcement settings for the account in all Regions

Use the get-instance-metadata-defaults command.

```
echo -e "Region   \t Level           HttpTokensEnforced" ; \
echo -e "-------------- \t ------------   ----------------" ; \
for region in $(
    aws ec2 describe-regions \
        --region us-east-1 \
        --query "Regions[*].[RegionName]" \
        --output text
    );
    do (output=$(
        aws ec2 get-instance-metadata-defaults \
            --region $region \
            --query 'AccountLevel.HttpTokensEnforced' \
            --output text)
        echo -e "$region \t ACCOUNTLEVEL $output"
    );
done
```

The following is example output.

```
Region           Level          HttpTokensEnforced
--------------   ------------   ------------------
ap-south-1       ACCOUNTLEVEL   enabled
eu-north-1       ACCOUNTLEVEL   enabled
eu-west-3        ACCOUNTLEVEL   enabled
...
```

PowerShell

To enforce IMDSv2 for the account in the specified Region

Use the Edit-EC2InstanceMetadataDefault cmdlet and specify the Region in which to enforce IMDSv2.

```
Edit-EC2InstanceMetadataDefault `
    -Region us-east-1 `
    -HttpToken required `
    -HttpPutResponseHopLimit 2
```

The following is example output.

```
@{
```

```
    Return = $true
}
```

To view the IMDSv2 enforcement setting for the account in a specific Region

Use the Get-EC2InstanceMetadataDefault command and specify the Region.

```
Get-EC2InstanceMetadataDefault -Region us-east-1
```

The following is example output.

```
@{
    AccountLevel = @{
        HttpTokens = "required"
        HttpTokensEnforced = "enabled"
    }
    ManagedBy = "account"
}
```

The `ManagedBy` field indicates the entity that configured the settings. In this example, `account` indicates that the settings were configured directly in the account. A value of `declarative-policy` would mean the settings were configured by a declarative policy. For more information, see Declarative policies in the *AWS Organizations User Guide*.

To enforce IMDSv2 for the account for all Regions

Use the modify-instance-metadata-defaults command to enforce IMDSv2 in all Regions.

```
echo -e "Region          \t Modified" ; \
echo -e "--------------  \t ---------" ; \
for region in $(
    aws ec2 describe-regions \
        --region us-east-1 \
        --query "Regions[*].[RegionName]" \
        --output text
    );
    do (output=$(
        aws ec2 modify-instance-metadata-defaults \
            --region $region \
            --http-tokens-enforced enabled \
            --output text)
```

```
        echo -e "$region        \t $output"
    );
done
```

The following is example output.

```
Region                  Modified
--------------          ---------
ap-south-1              True
eu-north-1              True
eu-west-3               True
...
```

To set IMDSv2 as the default for the account for all Regions

Use the Edit-EC2InstanceMetadataDefault cmdlet to modify the IMDS account level settings for all Regions. Include `-HttpToken` set to `required` and `-HttpPutResponseHopLimit` set to 2 if your instances will host containers. Otherwise, specify `-1` to indicate no preference. When `-1` (no preference) is specified, at launch, the value defaults to 2 if the AMI has the setting `ImdsSupport: v2.0`; otherwise it defaults to 1.

```
(Get-EC2Region).RegionName | `
    ForEach-Object {
    [PSCustomObject]@{
        Region   = $_
        Modified = (Edit-EC2InstanceMetadataDefault `
                -Region $_ `
                -HttpToken required `
                -HttpPutResponseHopLimit 2)
    }
} | `
Format-Table Region, Modified -AutoSize
```

Expected output

```
Region         Modified
------         --------
ap-south-1         True
eu-north-1         True
eu-west-3          True
...
```

To view the default account settings for the instance metadata options for all Regions

Use the Get-EC2InstanceMetadataDefault cmdlet.

```
(Get-EC2Region).RegionName | `
    ForEach-Object {
    [PSCustomObject]@{
        Region = $_
        HttpPutResponseHopLimit = (Get-EC2InstanceMetadataDefault -Region
 $_).HttpPutResponseHopLimit
        HttpTokens              = (Get-EC2InstanceMetadataDefault -Region
 $_).HttpTokens
    }
} | `
Format-Table -AutoSize
```

Example output

```
Region         HttpPutResponseHopLimit HttpTokens
------         ----------------------- ----------
ap-south-1                           2 required
eu-north-1                           2 required
eu-west-3                            2 required
...
```

Configure the instance at launch

When you launch an instance, you can configure the instance to require the use of IMDSv2 by configuring the following fields:

- Amazon EC2 console: Set **Metadata version** to **V2 only (token required)**.
- AWS CLI: Set `HttpTokens` to `required`.

When you specify that IMDSv2 is required, you must also enable the Instance Metadata Service (IMDS) endpoint by setting **Metadata accessible** to **Enabled** (console) or `HttpEndpoint` to `enabled` (AWS CLI).

In a container environment, when IMDSv2 is required, we recommend setting the hop limit to 2. For more information, see Instance metadata access considerations.

Console

To require the use of IMDSv2 on a new instance

- When launching a new instance in the Amazon EC2 console, expand **Advanced details**, and do the following:
  - For **Metadata accessible**, choose **Enabled**.
  - For **Metadata version**, choose **V2 only (token required)**.
  - (Container environment) For **Metadata response hop limit**, choose **2**.

  For more information, see Advanced details.

AWS CLI

To require the use of IMDSv2 on a new instance

The following run-instances example launches a `c6i.large` instance with `--metadata-options` set to `HttpTokens=required`. When you specify a value for `HttpTokens`, you must also set `HttpEndpoint` to `enabled`. Because the secure token header is set to `required` for metadata retrieval requests, this requires the instance to use IMDSv2 when requesting instance metadata.

In a container environment, when IMDSv2 is required, we recommend setting the hop limit to 2 with `HttpPutResponseHopLimit=2`.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type c6i.large \
 ...
    --metadata-options
 "HttpEndpoint=enabled,HttpTokens=required,HttpPutResponseHopLimit=2"
```

PowerShell

To require the use of IMDSv2 on a new instance

The following New-EC2Instance cmdlet example launches a `c6i.large` instance with `MetadataOptions_HttpEndpoint` set to `enabled` and the `MetadataOptions_HttpTokens` parameter to `required`. When you specify a value for

`HttpTokens`, you must also set `HttpEndpoint` to `enabled`. Because the secure token header is set to `required` for metadata retrieval requests, this requires the instance to use IMDSv2 when requesting instance metadata.

```
New-EC2Instance `
    -ImageId ami-0abcdef1234567890 `
    -InstanceType c6i.large `
    -MetadataOptions_HttpEndpoint enabled `
    -MetadataOptions_HttpTokens required
```

CloudFormation

To specify the metadata options for an instance using CloudFormation, see the AWS::EC2::LaunchTemplate MetadataOptions property in the *AWS CloudFormation User Guide*.

Configure the AMI

When you register a new AMI or modify an existing AMI, you can set the `imds-support` parameter to `v2.0`. Instances launched from this AMI will have **Metadata version** set to **V2 only (token required)** (console) or `HttpTokens` set to `required` (AWS CLI). With these settings, the instance requires that IMDSv2 is used when requesting instance metadata.

Note that when you set `imds-support` to `v2.0`, instances launched from this AMI will also have **Metadata response hop limit** (console) or `http-put-response-hop-limit` (AWS CLI) set to **2**.

> **Important**
>
> Do not use this parameter unless your AMI software supports IMDSv2. After you set the value to `v2.0`, you can't undo it. The only way to "reset" your AMI is to create a new AMI from the underlying snapshot.

To configure a new AMI for IMDSv2

Use one of the following methods to configure a new AMI for IMDSv2.

AWS CLI

The following register-image example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. Specify `v2.0` for the `imds-support` parameter so that

instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
aws ec2 register-image \
    --name my-image \
    --root-device-name /dev/xvda \
    --block-device-mappings DeviceName=/dev/
xvda,Ebs={SnapshotId=snap-0123456789example} \
    --architecture x86_64 \
    --imds-support v2.0
```

PowerShell

The following Register-EC2Image cmdlet example registers an AMI using the specified snapshot of an EBS root volume as device `/dev/xvda`. Specify `v2.0` for the `ImdsSupport` parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
Register-EC2Image `
    -Name 'my-image' `
    -RootDeviceName /dev/xvda `
    -BlockDeviceMapping  (
    New-Object `
        -TypeName Amazon.EC2.Model.BlockDeviceMapping `
        -Property @{
        DeviceName = '/dev/xvda';
        EBS        = (New-Object -TypeName Amazon.EC2.Model.EbsBlockDevice -Property
 @{
                SnapshotId = 'snap-0123456789example'
                VolumeType = 'gp3'
                } )
        }  ) `
    -Architecture X86_64 `
    -ImdsSupport v2.0
```

To configure an existing AMI for IMDSv2

Use one of the following methods to configure an existing AMI for IMDSv2.

AWS CLI

The following modify-image-attribute example modifies an existing AMI for IMDSv2 only. Specify `v2.0` for the `imds-support` parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
aws ec2 modify-image-attribute \
    --image-id ami-0abcdef1234567890 \
    --imds-support v2.0
```

PowerShell

The following Edit-EC2ImageAttribute cmdlet example modifies an existing AMI for IMDSv2 only. Specify `v2.0` for the `imds-support` parameter so that instances launched from this AMI will require that IMDSv2 is used when requesting instance metadata.

```
Edit-EC2ImageAttribute `
    -ImageId ami-0abcdef1234567890 `
    -ImdsSupport 'v2.0'
```

Use an IAM policy

You can create an IAM policy that does one of the following:

- Prevents users from launching new instances unless they require IMDSv2 on the new instance.
- Prevents users from calling the ModifyInstanceMetadataOptions API to change the metadata options of a running instance. Restrict access to the ModifyInstanceMetadataOptions httpTokens property to prevent unintended updates of running instances.
- Prevent users from calling the ModifyInstanceMetadataDefaults API to change the account default settings of both httpTokens and httpTokensEnforced. Restricting access to these two properties will ensure that only authorized roles can modify the account defaults.

To enforce the use of IMDSv2 on all new instances by using an IAM policy

To ensure that users can only launch instances that require the use of IMDSv2 when requesting instance metadata, do the following:

- Restrict access to both `ModifyInstanceMetadataOptions` and `ModifyInstanceMetadataDefaults` API, and more specifically the `httpTokens` and `httpTokensEnforced` properties.
- Then, set the account default to `httpTokens = required` and `httpTokensEnforced = enabled`.

  For the example IAM policy, see Work with instance metadata.

Enable the IMDS IPv4 and IPv6 endpoints

The IMDS has two endpoints on an instance: IPv4 (`169.254.169.254`) and IPv6 (`[fd00:ec2::254]`). When you enable the IMDS, the IPv4 endpoint is automatically enabled. The IPv6 endpoint remains disabled even if you launch an instance into an IPv6-only subnet. To enable the IPv6 endpoint, you need to do so explicitly. When you enable the IPv6 endpoint, the IPv4 endpoint remains enabled.

You can enable the IPv6 endpoint at instance launch or after.

Requirements for enabling the IPv6 endpoint

- The selected instance type is a Nitro-based instance.
- The selected subnet supports IPv6, where the subnet is either dual stack or IPv6 only.

Use any of the following methods to launch an instance with the IMDS IPv6 endpoint enabled.

Console

To enable the IMDS IPv6 endpoint at instance launch

- Launch the instance in the Amazon EC2 console with the following specified under **Advanced details**:
  - For **Metadata IPv6 endpoint**, choose **Enabled**.

For more information, see Advanced details.

AWS CLI

To enable the IMDS IPv6 endpoint at instance launch

The following run-instances example launches a `c6i.large` instance with the IPv6 endpoint enabled for the IMDS. To enable the IPv6 endpoint, for the `--metadata-options` parameter, specify `HttpProtocolIpv6=enabled`. When you specify a value for `HttpProtocolIpv6`, you must also set `HttpEndpoint` to `enabled`.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type c6i.large \
    ...
    --metadata-options "HttpEndpoint=enabled,HttpProtocolIpv6=enabled"
```

PowerShell

To enable the IMDS IPv6 endpoint at instance launch

The following New-EC2Instance cmdlet example launches a `c6i.large` instance with the IPv6 endpoint enabled for the IMDS. To enable the IPv6 endpoint, specify `MetadataOptions_HttpProtocolIpv6` as `enabled`. When you specify a value for `MetadataOptions_HttpProtocolIpv6`, you must also set `MetadataOptions_HttpEndpoint` to `enabled`.

```
New-EC2Instance `
    -ImageId ami-0abcdef1234567890 `
    -InstanceType c6i.large `
    -MetadataOptions_HttpEndpoint enabled `
    -MetadataOptions_HttpProtocolIpv6 enabled
```

Turn off access to instance metadata

You can turn off access to the instance metadata by disabling the IMDS when you launch an instance. You can turn on access later by re-enabling the IMDS. For more information, see Turn on access to instance metadata.

> **Important**
>
> You can choose to disable the IMDS at launch or after launch. If you disable the IMDS *at launch*, the following might not work:

- You might not have SSH access to your instance. The `public-keys/0/openssh-key`, which is your instance's public SSH key, will not be accessible because the key is normally provided and accessed from EC2 instance metadata.
- EC2 user data will not be available and will not run at instance start. EC2 user data is hosted on the IMDS. If you disable the IMDS, you effectively turn off access to user data.

To access this functionality, you can re-enable the IMDS after launch.

Console

To turn off access to instance metadata at launch

- Launch the instance in the Amazon EC2 console with the following specified under **Advanced details**:
  - For **Metadata accessible**, choose **Disabled**.

For more information, see Advanced details.

AWS CLI

To turn off access to instance metadata at launch at launch

Launch the instance with `--metadata-options` set to `HttpEndpoint=disabled`.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type c6i.large \
    ...
    --metadata-options "HttpEndpoint=disabled"
```

PowerShell

To turn off access to instance metadata at launch at launch

The following New-EC2Instance cmdlet example launches an instance with `MetadataOptions_HttpEndpoint` set to `disabled`.

```
New-EC2Instance `
```

```
    -ImageId ami-0abcdef1234567890 `
    -InstanceType c6i.large `
    -MetadataOptions_HttpEndpoint disabled
```

CloudFormation

To specify the metadata options for an instance using CloudFormation, see the AWS::EC2::LaunchTemplate MetadataOptions property in the *CloudFormation User Guide*.

Allow access to tags in instance metadata

By default, instance tags are not accessible in the instance metadata. For each instance, you must explicitly allow access. If access is allowed, instance tag *keys* must comply with specific character restrictions, otherwise the instance launch will fail. For more information, see Enable access to tags in instance metadata.

Modify instance metadata options for existing instances

You can modify the instance metadata options for existing instances.

You can also create an IAM policy that prevents users from modifying the instance metadata options on existing instances. To control which users can modify the instance metadata options, specify a policy that prevents all users other than users with a specified role to use the ModifyInstanceMetadataOptions API. For the example IAM policy, see Work with instance metadata.

> **Note**
>
> If a declarative policy was used to configure the instance metadata options, you can't modify them directly within the account. For more information, see Declarative policies in the *AWS Organizations User Guide.*

Require the use of IMDSv2

Use one of the following methods to modify the instance metadata options on an existing instance to require that IMDSv2 is used when requesting instance metadata. When IMDSv2 is required, IMDSv1 cannot be used.

Note

Before requiring that IMDSv2 is used, ensure that the instance isn't making IMDSv1 calls. The `MetadataNoToken` CloudWatch metric tracks IMDSv1 calls. When `MetadataNoToken` records zero IMDSv1 usage for an instance, the instance is then ready to require IMDSv2.

Console

To require the use of IMDSv2 on an existing instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions**, **Instance settings**, **Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
   a. For **Instance metadata service**, select **Enable**.
   b. For **IMDSv2**, choose **Required**.
   c. Choose **Save**.

AWS CLI

To require the use of IMDSv2 on an existing instance

Use the modify-instance-metadata-options CLI command and set the `http-tokens` parameter to `required`. When you specify a value for `http-tokens`, you must also set `http-endpoint` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567890abcdef0 \
    --http-tokens required \
    --http-endpoint enabled
```

PowerShell

To require the use of IMDSv2 on an existing instance

Use the Edit-EC2InstanceMetadataOption cmdlet and set the `HttpTokens` parameter to `required`. When you specify a value for `HttpTokens`, you must also set `HttpEndpoint` to `enabled`.

```
(Edit-EC2InstanceMetadataOption `
    -InstanceId i-1234567890abcdef0 `
    -HttpTokens required `
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Restore the use of IMDSv1

When IMDSv2 is required on an instance, using an IMDSv1 request will fail. When IMDSv2 is optional, then both IMDSv2 and IMDSv1 will work. Therefore, to restore IMDSv1, set IMDSv2 to optional (`httpTokens = optional`) using one of the following methods.

The `httpTokensEnforced` IMDS property also prevents attempts to enable IMDSv1 on an existing instance. When enabled for an account in a Region, an attempt to set `httpTokens` to `optional` will result in an `UnsupportedOperation` exception. Fore more information, see Troubleshooting.

Important

If your instance launches are failing due to IMDSv2 enforcement, you have two options to enable launches to succeed:

- **Launch instances as IMDSv2-only** – If the software running on the instances uses IMDSv2 only (no dependency on IMDSv1), then you can launch the instances as IMDSv2 only. To do this, configure IMDSv2 only by setting `httpTokens = required` either in the launch parameters or in the metadata defaults for the account in the Region.
- **Disable enforcement** – If your software still depends on IMDSv1, set `httpTokensEnforced` to `disabled` for the account in the Region. For more information, see Enforce IMDSv2 at the account level.

Console

To restore the use of IMDSv1 on an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions**, **Instance settings**, **Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:

    a. For **Instance metadata service**, make sure that **Enable** is selected.

    b. For **IMDSv2**, choose **Optional**.

    c. Choose **Save**.

AWS CLI

To restore the use of IMDSv1 on an instance

You can use the modify-instance-metadata-options CLI command with `http-tokens` set to `optional` to restore the use of IMDSv1 when requesting instance metadata.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567890abcdef0 \
    --http-tokens optional \
    --http-endpoint enabled
```

PowerShell

To restore the use of IMDSv1 on an instance

You can use the Edit-EC2InstanceMetadataOption cmdlet with `HttpTokens` set to `optional` to restore the use of IMDSv1 when requesting instance metadata.

```
(Edit-EC2InstanceMetadataOption `
    -InstanceId i-1234567890abcdef0 `
    -HttpTokens optional `
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Change the PUT response hop limit

For existing instances, you can change the settings of the PUT response hop limit.

Currently only the AWS CLI and AWS SDKs support changing the PUT response hop limit.

AWS CLI

To change the PUT response hop limit

Use the modify-instance-metadata-options CLI command and set the `http-put-response-hop-limit` parameter to the required number of hops. In the following example, the hop limit is set to 3. Note that when specifying a value for `http-put-response-hop-limit`, you must also set `http-endpoint` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567890abcdef0 \
    --http-put-response-hop-limit 3 \
    --http-endpoint enabled
```

PowerShell

To change the PUT response hop limit

Use the Edit-EC2InstanceMetadataOption cmdlet and set the `HttpPutResponseHopLimit` parameter to the required number of hops. In the following example, the hop limit is set to 3. Note that when specifying a value for `HttpPutResponseHopLimit`, you must also set `HttpEndpoint` to `enabled`.

```
(Edit-EC2InstanceMetadataOption `
    -InstanceId i-1234567890abcdef0 `
    -HttpPutResponseHopLimit 3 `
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Enable the IMDS IPv4 and IPv6 endpoints

The IMDS has two endpoints on an instance: IPv4 (`169.254.169.254`) and IPv6 (`[fd00:ec2::254]`). When you enable the IMDS, the IPv4 endpoint is automatically enabled. The IPv6 endpoint remains disabled even if you launch an instance into an IPv6-only subnet. To enable the IPv6 endpoint, you need to do so explicitly. When you enable the IPv6 endpoint, the IPv4 endpoint remains enabled.

You can enable the IPv6 endpoint at instance launch or after.

Requirements for enabling the IPv6 endpoint

- The selected instance type is a Nitro-based instance.

- The selected subnet supports IPv6, where the subnet is either dual stack or IPv6 only.

Currently only the AWS CLI and AWS SDKs support enabling the IMDS IPv6 endpoint after instance launch.

AWS CLI

To enable the IMDS IPv6 endpoint for your instance

Use the modify-instance-metadata-options CLI command and set the `http-protocol-ipv6` parameter to `enabled`. Note that when specifying a value for `http-protocol-ipv6`, you must also set `http-endpoint` to `enabled`.

```
aws ec2 modify-instance-metadata-options \
 --instance-id i-1234567890abcdef0 \
 --http-protocol-ipv6 enabled \
 --http-endpoint enabled
```

PowerShell

To enable the IMDS IPv6 endpoint for your instance

Use the Edit-EC2InstanceMetadataOption cmdlet and set the `HttpProtocolIpv6` parameter to `enabled`. Note that when specifying a value for `HttpProtocolIpv6`, you must also set `HttpEndpoint` to `enabled`.

```
(Edit-EC2InstanceMetadataOption `
    -InstanceId i-1234567890abcdef0 `
    -HttpProtocolIpv6 enabled `
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Turn on access to instance metadata

You can turn on access to instance metadata by enabling the HTTP endpoint of the IMDS on your instance, regardless of which version of the IMDS you are using. You can reverse this change at any time by disabling the HTTP endpoint.

Use one of the following methods to turn on access to instance metadata on an instance.

Console

To turn on access to instance metadata

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions**, **Instance settings**, **Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
   a. For **Instance metadata service**, select **Enable**.
   b. Choose **Save**.

AWS CLI

To turn on access to instance metadata

Use the modify-instance-metadata-options CLI command and set the `http-endpoint` parameter to `enabled`.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567890abcdef0 \
    --http-endpoint enabled
```

PowerShell

To turn on access to instance metadata

Use the Edit-EC2InstanceMetadataOption cmdlet and set the `HttpEndpoint` parameter to `enabled`.

```
(Edit-EC2InstanceMetadataOption `
    -InstanceId i-1234567890abcdef0 `
    -HttpEndpoint enabled).InstanceMetadataOptions
```

Turn off access to instance metadata

You can turn off access to instance metadata by disabling the HTTP endpoint of the IMDS on your instance, regardless of which version of the IMDS you are using. You can reverse this change at any time by enabling the HTTP endpoint.

Use one of the following methods to turn off access to instance metadata on an instance.

Console

To turn off access to instance metadata

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance.
4. Choose **Actions**, **Instance settings**, **Modify instance metadata options**.
5. In the **Modify instance metadata options** dialog box, do the following:
   a. For **Instance metadata service**, clear **Enable**.
   b. Choose **Save**.

AWS CLI

To turn off access to instance metadata

Use the modify-instance-metadata-options CLI command and set the `http-endpoint` parameter to `disabled`.

```
aws ec2 modify-instance-metadata-options \
    --instance-id i-1234567890abcdef0 \
    --http-endpoint disabled
```

PowerShell

To turn off access to instance metadata

Use the Edit-EC2InstanceMetadataOption cmdlet and set the `HttpEndpoint` parameter to `disabled`.

```
(Edit-EC2InstanceMetadataOption `
```

```
    -InstanceId i-1234567890abcdef0 `
    -HttpEndpoint disabled).InstanceMetadataOptions
```

Allow access to tags in instance metadata

You can allow access to tags in the instance metadata on a running or stopped instance. For each instance, you must explicitly allow access. If access is allowed, instance tag *keys* must comply with specific character restrictions, otherwise you get an error. For more information, see Enable access to tags in instance metadata.

Troubleshooting

Modifying an IMDSv1-enabled instance fails

Description

You get the following error message:

```
You can't launch instances with IMDSv1 because httpTokensEnforced
is enabled for this account. Either launch the instance with
httpTokens=required or contact your account owner to disable
httpTokensEnforced using the ModifyInstanceMetadataDefaults API or the
account settings in the EC2 console.
```

Cause

This error is thrown when you attempt to modify an existing instance to be IMDSv1 enabled (`httpTokens = optional`) in an account where the EC2 account settings or an AWS Organization declarative policy enforces the use of IMDSv2 (`httpTokensEnforced = enabled`).

Solution

If you require IMDSv1 support on existing instances, you'll need to disable IMDSv2 enforcement for the account in the Region. To disable IMDSv2 enforcement, set `HttpTokensEnforced` to `disabled`. For more information, see ModifyInstanceMetadataDefaults in the Amazon EC2 API Reference. If you prefer to configure this setting using the console, see Enforce IMDSv2 at the account level.

We recommend that you use IMDSv2 only (`httpTokens=required`). For more information, see Transition to using Instance Metadata Service Version 2.

Run commands when you launch an EC2 instance with user data input

When you launch an Amazon EC2 instance, you can pass user data to the instance that is used to perform automated configuration tasks, or to run scripts after the instance starts.

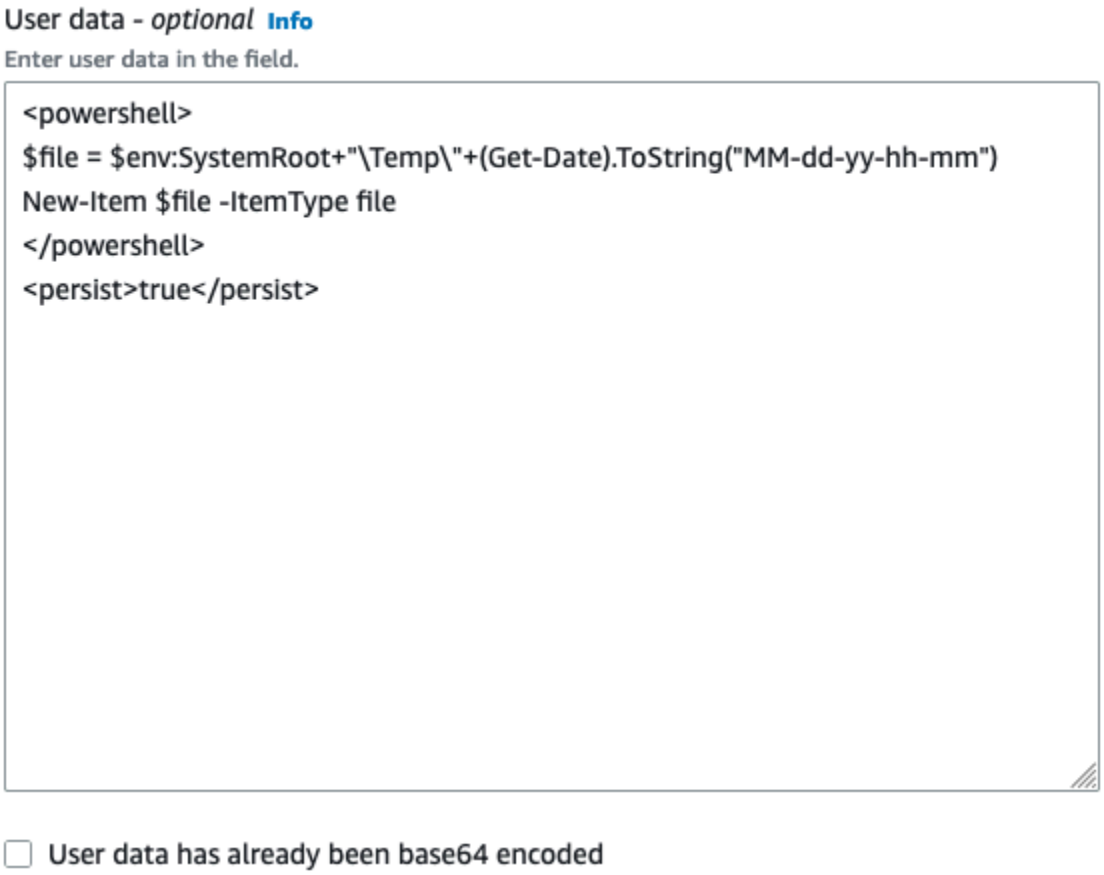
If you're interested in more complex automation scenarios, you might consider CloudFormation. For more information, see Deploying applications on Amazon EC2 with CloudFormation in the *AWS CloudFormation User Guide*.

On Linux instances, you can pass two types of user data to Amazon EC2: shell scripts and cloud-init directives. You can also pass this data into the launch instance wizard as plain text, as a file (this is useful for launching instances with the command line tools), or as base64-encoded text (for API calls).

On Windows instances, the launch agents handle your user data scripts.

Considerations

- User data is treated as opaque data: what you give is what you get back. It is up to the instance to interpret it.
- User data must be base64-encoded. The Amazon EC2 console can perform the base64-encoding for your or accept base64-encoded input. If you retrieve the user data using instance metadata or the console, it's base64-decoded for you automatically.
- User data is limited to 16 KB, in raw form, before it is base64-encoded. The size of a string of length *n* after base64-encoding is ceil(*n*/3)*4.
- User data is an instance attribute. If you create an AMI from an instance, the instance user data is not included in the AMI.



User data in the AWS Management Console

You can specify instance user data when you launch the instance. If the root volume of the instance is an EBS volume, you can also stop the instance and update its user data.

Specify instance user data at launch with the Launch Wizard

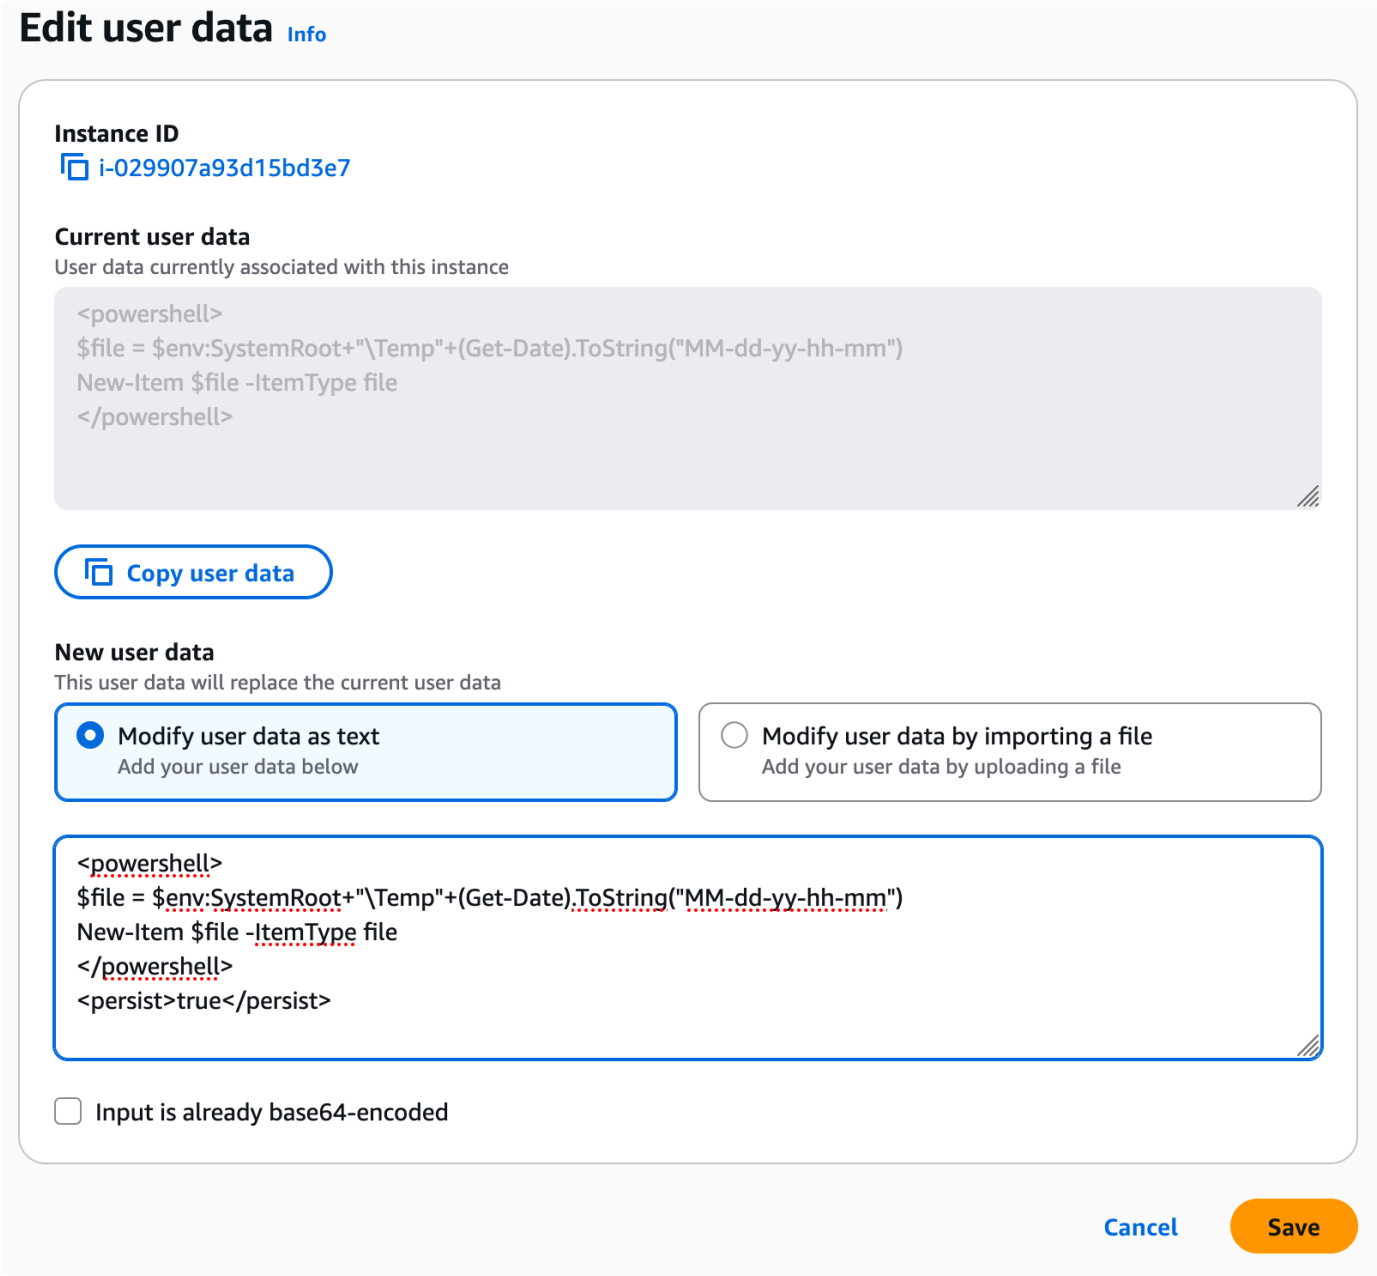
You can specify user data when you launch an instance with the Launch Wizard in the EC2 console. To specify user data on launch, follow the procedure for launching an instance. The **User data** field is located in the Advanced details section of the launch instance wizard. Enter your PowerShell script in the **User data** field, and then complete the instance launch procedure.

In the following screenshot of the **User data** field, the example script creates a file in the Windows temporary folder, using the current date and time in the file name. When you include `<persist>true</persist>`, the script is run every time you reboot or start the instance. If you leave the **User data has already been base64 encoded** checkbox empty, the Amazon EC2 console performs the base64 encoding for you.

For more information, see Specify instance user data at launch with the Launch Wizard. For a Linux example that uses the AWS CLI, see the section called “User data and the AWS CLI”. For a Windows example that uses the Tools for Windows PowerShell, see the section called “User data and the Tools for Windows PowerShell”.

View and update the instance user data

You can view the instance user data for any instance, and you can update the instance user data for a stopped instance.



To update the user data for an instance using the console

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Actions**, **Instance state**, **Stop instance**.

> **Warning**
>
> When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

4. When prompted for confirmation, choose **Stop**. It can take a few minutes for the instance to stop.
5. With the instance still selected, choose **Actions**, **Instance settings**, **Edit user data**. You can't change the user data if the instance is running, but you can view it.
6. In the **Edit user data** dialog box, update the user data, and then choose **Save**. To run user data scripts every time you reboot or start the instance, add `<persist>true</persist>`, as shown in the following example:

7. Start the instance. If you enabled user data execution for subsequent reboots or starts, the updated user data scripts are run as part of the instance start process.

How Amazon EC2 handles user data for Linux instances

The following examples use user data to run commands that set up a LAMP server when the instance launches. In each example, the following tasks are performed:

- The distribution software packages are updated.

- The web server, php, and `mariadb` packages are installed.
- The `httpd` service is started and turned on.
- The user `ec2-user` is added to the apache group.
- The appropriate ownership and file permissions are set for the web directory and the files contained within it.
- A simple web page is created to test the web server and PHP engine.

Contents

- Prerequisites
- User data and shell scripts
- Update the instance user data
- User data and cloud-init directives
- User data and the AWS CLI
- Combine shell scripts and cloud-init directives

Prerequisites

The examples in this topic assume the following:

- Your instance has a public DNS name that is reachable from the internet.
- The security group associated with your instance is configured to allow SSH (port 22) traffic so that you can connect to the instance to view the output log files.
- Your instance is launched using an Amazon Linux AMI. The commands and directives might not work for other Linux distributions. For more information about other distributions, such as their support for cloud-init, see documentation for the specific distribution.

User data and shell scripts

If you are familiar with shell scripting, this is the easiest and most complete way to send instructions to an instance at launch. Adding these tasks at boot time adds to the amount of time it takes to boot the instance. You should allow a few minutes of extra time for the tasks to complete before you test that the user script has finished successfully.

Important

By default, user data scripts and cloud-init directives run only during the boot cycle when you first launch an instance. You can update your configuration to ensure that your user data scripts and cloud-init directives run every time you restart your instance. For more information, see How can I utilize user data to automatically run a script with every restart of my Amazon EC2 Linux instance? in the AWS Knowledge Center.

User data shell scripts must start with the `#!` characters and the path to the interpreter you want to read the script (commonly **/bin/bash)**. For an introduction on shell scripting, see the Bash Reference Manual on the *GNU Operating System* website.

Scripts entered as user data are run as the root user, so do not use the **sudo** command in the script. Remember that any files you create will be owned by the root user; if you need a non-root user to have file access, you should modify the permissions accordingly in the script. Also, because the script is not run interactively, you cannot include commands that require user feedback (such as **yum update** without the `-y` flag).

If you use an AWS API, including the AWS CLI, in a user data script, you must use an instance profile when launching the instance. An instance profile provides the appropriate AWS credentials required by the user data script to issue the API call. For more information, see Use instance profiles in the IAM User Guide. The permissions you assign to the IAM role depend on which services you are calling with the API. For more information, see IAM roles for Amazon EC2.

The cloud-init output log file captures console output so it is easy to debug your scripts following a launch if the instance does not behave the way you intended. To view the log file, connect to the instance and open `/var/log/cloud-init-output.log`.

When a user data script is processed, it is copied to and run from `/var/lib/cloud/instances/`*`instance-id`*`/`. The script is not deleted after it is run. Be sure to delete the user data scripts from `/var/lib/cloud/instances/`*`instance-id`*`/` before you create an AMI from the instance. Otherwise, the script will exist in this directory on any instance launched from the AMI.

Update the instance user data

To update the instance user data, you must first stop the instance. If the instance is running, you can view the user data but you cannot modify it.

> **Warning**
>
> When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

To modify instance user data

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance and choose **Instance state**, **Stop instance**. If this option is disabled, either the instance is already stopped or its root volume is an instance store volume.
4. When prompted for confirmation, choose **Stop**. It can take a few minutes for the instance to stop.
5. With the instance still selected, choose **Actions**, **Instance settings**, **Edit user data**.
6. Modify the user data as needed, and then choose **Save**.
7. Start the instance. The new user data is visible on your instance after you start it; however, user data scripts are not run.

User data and cloud-init directives

The cloud-init package configures specific aspects of a new Amazon Linux instance when it is launched; most notably, it configures the `.ssh/authorized_keys` file for the ec2-user so you can log in with your own private key. For more information about the configuration tasks that the cloud-init package performs for Amazon Linux instances, see the following documentation:

- **Amazon Linux 2023** – Customized cloud-init
- **Amazon Linux 2** – Using cloud-init on Amazon Linux 2

The cloud-init user directives can be passed to an instance at launch the same way that a script is passed, although the syntax is different. For more information about cloud-init, see https://cloudinit.readthedocs.org/en/latest/index.html.

Important

By default, user data scripts and cloud-init directives run only during the boot cycle when you first launch an instance. You can update your configuration to ensure that your user data scripts and cloud-init directives run every time you restart your instance. For more information, see How can I utilize user data to automatically run a script with every restart of my Amazon EC2 Linux instance? in the AWS Knowledge Center.

Adding these tasks at boot time adds to the amount of time it takes to boot an instance. You should allow a few minutes of extra time for the tasks to complete before you test that your user data directives have completed.

To pass cloud-init directives to an Amazon Linux instance

1. Follow the procedure for launching an instance. The **User data** field is located in the Advanced details section of the launch instance wizard. Enter your cloud-init directive text in the **User data** field, and then complete the instance launch procedure.

   In the examples below, the directives create and configure a web server on Amazon Linux. The `#cloud-config` line at the top is required to identify the commands as cloud-init directives.

   AL2023

```
#cloud-config
package_update: true
package_upgrade: all

packages:
- httpd
- mariadb105-server
- php8.1
- php8.1-mysqlnd

runcmd:
- systemctl start httpd
- systemctl enable httpd
- [ sh, -c, "usermod -a -G apache ec2-user" ]
- [ sh, -c, "chown -R ec2-user:apache /var/www" ]
- chmod 2775 /var/www
- [ find, /var/www, -type, d, -exec, chmod, 2775, {}, \; ]
```

```
- [ find, /var/www, -type, f, -exec, chmod, 0664, {}, \; ]
- [ sh, -c, 'echo "<?php phpinfo(); ?>" > /var/www/html/phpinfo.php' ]
```

AL2

```
#cloud-config
package_update: true
package_upgrade: all

packages:
- httpd
- mariadb-server

runcmd:
- [ sh, -c, "amazon-linux-extras install -y lamp-mariadb10.2-php7.2 php7.2" ]
- systemctl start httpd
- systemctl enable httpd
- [ sh, -c, "usermod -a -G apache ec2-user" ]
- [ sh, -c, "chown -R ec2-user:apache /var/www" ]
- chmod 2775 /var/www
- [ find, /var/www, -type, d, -exec, chmod, 2775, {}, \; ]
- [ find, /var/www, -type, f, -exec, chmod, 0664, {}, \; ]
- [ sh, -c, 'echo "<?php phpinfo(); ?>" > /var/www/html/phpinfo.php' ]
```

2. Allow enough time for the instance to launch and run the directives in your user data, and then check to see that your directives have completed the tasks you intended.

   For this example, in a web browser, enter the URL of the PHP test file the directives created. This URL is the public DNS address of your instance followed by a forward slash and the file name.

   ```
   http://my.public.dns.amazonaws.com/phpinfo.php
   ```

   You should see the PHP information page. If you are unable to see the PHP information page, check that the security group you are using contains a rule to allow HTTP (port 80) traffic. For more information, see Configure security group rules.

3. (Optional) If your directives did not accomplish the tasks you were expecting them to, or if you just want to verify that your directives completed without errors, connect to the instance, examine the output log file (`/var/log/cloud-init-output.log`), and look for error

messages in the output. For additional debugging information, you can add the following line to your directives:

```
output : { all : '| tee -a /var/log/cloud-init-output.log' }
```

This directive sends **runcmd** output to `/var/log/cloud-init-output.log`.

User data and the AWS CLI

You can use the AWS CLI to specify, modify, and view the user data for your instance. For information about viewing user data from your instance using instance metadata, see Access instance metadata for an EC2 instance.

On Windows, you can use the AWS Tools for Windows PowerShell instead of using the AWS CLI. For more information, see User data and the Tools for Windows PowerShell .

Example: Specify user data at launch

To specify user data when you launch your instance, use the run-instances command with the `--user-data` parameter. With **run-instances**, the AWS CLI performs base64 encoding of the user data for you.

The following example shows how to specify a script as a string on the command line:

```
aws ec2 run-instances --image-id ami-abcd1234 --count 1 --instance-type m3.medium \
    --key-name my-key-pair --subnet-id subnet-abcd1234 --security-group-ids sg-abcd1234
 \
    --user-data echo user data
```

The following example shows how to specify a script using a text file. Be sure to use the `file://` prefix to specify the file.

```
aws ec2 run-instances --image-id ami-abcd1234 --count 1 --instance-type m3.medium \
    --key-name my-key-pair --subnet-id subnet-abcd1234 --security-group-ids sg-abcd1234
 \
    --user-data file://my_script.txt
```

The following is an example text file with a shell script.

```
#!/bin/bash
```

```
yum update -y
service httpd start
chkconfig httpd on
```

Example: Modify the user data of a stopped instance

You can modify the user data of a stopped instance using the modify-instance-attribute command. With **modify-instance-attribute**, the AWS CLI does not perform base64 encoding of the user data for you.

- On a **Linux** computer, use the base64 command to encode the user data.

```
base64 my_script.txt >my_script_base64.txt
```

- On a **Windows** computer, use the certutil command to encode the user data. Before you can use this file with the AWS CLI, you must remove the first (BEGIN CERTIFICATE) and last (END CERTIFICATE) lines.

```
certutil -encode my_script.txt my_script_base64.txt
notepad my_script_base64.txt
```

Use the `--attribute` and `--value` parameters to use the encoded text file to specify the user data. Be sure to use the `file://` prefix to specify the file.

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --attribute
 userData --value file://my_script_base64.txt
```

Example: Clear the user data of a stopped instance

To delete the existing user data, use the modify-instance-attribute command as follows:

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --user-data Value=
```

Example: View user data

To retrieve the user data for an instance, use the describe-instance-attribute command. With **describe-instance-attribute**, the AWS CLI does not perform base64 decoding of the user data for you.

```
aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
 userData
```

The following is example output with the user data base64 encoded.

```
{
    "UserData": {
        "Value":
 "IyEvYmluL2Jhc2gKeXVtIHVwZGF0ZSAteQpzZXJ2aWNlIGh0dHBkIHN0YXJ0CmNoa2NvbmZpZyBodHRwZCBvbg=="
    },
    "InstanceId": "i-1234567890abcdef0"
}
```

- On a **Linux** computer , use the `--query` option to get the encoded user data and the base64 command to decode it.

  ```
  aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
   userData --output text --query "UserData.Value" | base64 --decode
  ```

- On a **Windows** computer, use the `--query` option to get the coded user data and the certutil command to decode it. Note that the encoded output is stored in a file and the decoded output is stored in another file.

  ```
  aws ec2 describe-instance-attribute --instance-id i-1234567890abcdef0 --attribute
   userData --output text --query "UserData.Value" >my_output.txt
  certutil -decode my_output.txt my_output_decoded.txt
  type my_output_decoded.txt
  ```

The following is example output.

```
#!/bin/bash
yum update -y
service httpd start
chkconfig httpd on
```

Combine shell scripts and cloud-init directives

By default, you can include only one content type in user data at a time. However, you can use the `text/cloud-config` and `text/x-shellscript` content-types in a mime-multi part file to include both a shell script and cloud-init directives in your user data.

The following shows the mime-multi part format.

```
Content-Type: multipart/mixed; boundary="//"
MIME-Version: 1.0

--//
Content-Type: text/cloud-config; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
Content-Disposition: attachment; filename="cloud-config.txt"

#cloud-config
cloud-init directives

--//
Content-Type: text/x-shellscript; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
Content-Disposition: attachment; filename="userdata.txt"

#!/bin/bash
shell script commands
--//--
```

For example, the following user data includes cloud-init directives and a bash shell script. The cloud-init directives creates a file (`/test-cloudinit/cloud-init.txt`), and writes `Created by cloud-init` to that file. The bash shell script creates a file (`/test-userscript/userscript.txt`) and writes `Created by bash shell script` to that file.

```
Content-Type: multipart/mixed; boundary="//"
MIME-Version: 1.0

--//
Content-Type: text/cloud-config; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
```

```
Content-Disposition: attachment; filename="cloud-config.txt"

#cloud-config
runcmd:
- [ mkdir, /test-cloudinit ]
write_files:
- path: /test-cloudinit/cloud-init.txt
content: Created by cloud-init

--//
Content-Type: text/x-shellscript; charset="us-ascii"
MIME-Version: 1.0
Content-Transfer-Encoding: 7bit
Content-Disposition: attachment; filename="userdata.txt"

#!/bin/bash
mkdir test-userscript
touch /test-userscript/userscript.txt
echo "Created by bash shell script" >> /test-userscript/userscript.txt
--//--
```

How Amazon EC2 handles user data for Windows instances

On Windows instances, the launch agent performs the tasks related to user data. For more information, see the following:

- EC2Launch v2
- EC2Launch
- EC2Config service

For examples of the assembly of a `UserData` property in a CloudFormation template, see Base64 Encoded UserData Property and Base64 Encoded UserData Property with AccessKey and SecretKey.

For an example of running commands on an instance within an Auto Scaling group that works with lifecycle hooks, see Tutorial: Configure user data to retrieve the target lifecycle state through instance metadata in the *Amazon EC2 Auto Scaling User Guide*.

Contents

- User data scripts
- Compressed user data

- User data execution
- User data and the Tools for Windows PowerShell

User data scripts

For `EC2Config` or `EC2Launch` to run scripts, you must enclose the script within a special tag when you add it to user data. The tag that you use depends on whether the commands run in a Command Prompt window (batch commands) or use Windows PowerShell.

If you specify both a batch script and a Windows PowerShell script, the batch script runs first and the Windows PowerShell script runs next, regardless of the order in which they appear in the instance user data.

If you use an AWS API, including the AWS CLI, in a user data script, you must use an instance profile when launching the instance. An instance profile provides the appropriate AWS credentials required by the user data script to make the API call. For more information, see Instance profiles. The permissions you assign to the IAM role depend on which services you are calling with the API. For more information, see IAM roles for Amazon EC2.

Script type

- Syntax for batch scripts
- Syntax for Windows PowerShell scripts
- Syntax for YAML configuration scripts
- Base64 encoding

Syntax for batch scripts

Specify a batch script using the `script` tag. Separate the commands using line breaks as shown in the following example.

```
<script>
    echo Current date and time >> %SystemRoot%\Temp\test.log
    echo %DATE% %TIME% >> %SystemRoot%\Temp\test.log
</script>
```

By default, user data scripts run one time when you launch the instance. To run the user data scripts every time you reboot or start the instance, add `<persist>true</persist>` to the user data.

```
<script>
    echo Current date and time >> %SystemRoot%\Temp\test.log
    echo %DATE% %TIME% >> %SystemRoot%\Temp\test.log
</script>
<persist>true</persist>
```

EC2Launch v2 agent

To run an XML user data script as a detached process with the EC2Launch v2 **executeScript** task in the `UserData` stage, add `<detach>true</detach>` to the user data.

> **Note**
>
> The detach tag is not supported by previous launch agents.

```
<script>
    echo Current date and time >> %SystemRoot%\Temp\test.log
    echo %DATE% %TIME% >> %SystemRoot%\Temp\test.log
</script>
<detach>true</detach>
```

Syntax for Windows PowerShell scripts

The AWS Windows AMIs include the AWS Tools for Windows PowerShell, so you can specify these cmdlets in user data. If you associate an IAM role with your instance, you don't need to specify credentials to the cmdlets, as applications that run on the instance use the role's credentials to access AWS resources (for example, Amazon S3 buckets).

Specify a Windows PowerShell script using the `<powershell>` tag. Separate the commands using line breaks. The `<powershell>` tag is case-sensitive.

For example:

```
<powershell>
    $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
```

By default, the user data scripts run one time when you launch the instance. To run the user data scripts every time you reboot or start the instance, add `<persist>true</persist>` to the user data.

```
<powershell>
    $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

You can specify one or more PowerShell arguments with the `<powershellArguments>` tag. If no arguments are passed, EC2Launch and EC2Launch v2 add the following argument by default: `-ExecutionPolicy Unrestricted`.

Example:

```
<powershell>
    $file = $env:SystemRoot + "\Temp" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
<powershellArguments>-ExecutionPolicy Unrestricted -NoProfile -NonInteractive</
powershellArguments>
```

EC2Launch v2 agent

To run an XML user data script as a detached process with the EC2Launch v2 **executeScript** task in the `UserData` stage, add `<detach>true</detach>` to the user data.

> **Note**
>
> The detach tag is not supported by previous launch agents.

```
<powershell>
    $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
<detach>true</detach>
```

Syntax for YAML configuration scripts

If you are using EC2Launch v2 to run scripts, you can use the YAML format. To view configuration tasks, details, and examples for EC2Launch v2, see EC2Launch v2 task configuration.

Specify a YAML script with the `executeScript` task.

Example YAML syntax to run a PowerShell script

```
version: 1.0
tasks:
- task: executeScript
  inputs:
  - frequency: always
    type: powershell
    runAs: localSystem
    content: |-
      $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
      New-Item $file -ItemType file
```

Example YAML syntax to run a batch script

```
version: 1.1
tasks:
- task: executeScript
  inputs:
  - frequency: always
    type: batch
    runAs: localSystem
    content: |-
      echo Current date and time >> %SystemRoot%\Temp\test.log
      echo %DATE% %TIME% >> %SystemRoot%\Temp\test.log
```

Base64 encoding

If you're using the Amazon EC2 API or a tool that does not perform base64 encoding of the user data, you must encode the user data yourself. If not, an error is logged about being unable to find `script` or `powershell` tags to run. The following is an example that encodes using Windows PowerShell.

```
$UserData =
 [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($Script))
```

The following is an example that decodes using PowerShell.

```
$Script =
 [System.Text.Encoding]::UTF8.GetString([System.Convert]::FromBase64String($UserData))
```

For more information about base64 encoding, see https://www.ietf.org/rfc/rfc4648.txt.

Compressed user data

EC2Launch v2 supports zipped user data as a method to submit user data that's larger than the 16 KB limit imposed by IMDS. To use this feature, compress your user data script into a `.zip` archive and pass it to your EC2 instance. When EC2Launch v2 detects compressed user data, it automatically unzips the compressed user data script and runs it.

As with standard user data, if you're using the Amazon EC2 API or a tool that does not perform base64 encoding of the user data, you must encode the compressed user data yourself. For more information about the user data size limit and base64 encoding, see Access instance metadata for an EC2 instance.

User data execution

By default, all AWS Windows AMIs have user data execution enabled for the initial launch. You can specify that user data scripts are run the next time the instance reboots or restarts. Alternatively, you can specify that user data scripts are run every time the instance reboots or restarts.

> **Note**
>
> User data is not enabled to run by default after the initial launch. To enable user data to run when you reboot or start the instance, see Run scripts during subsequent reboots or starts.

User data scripts are run from the local administrator account when a random password is generated. Otherwise, user data scripts are run from the System account.

Instance launch scripts

Scripts in the instance user data are run during the initial launch of the instance. If the `persist` tag is found, user data execution is enabled for subsequent reboots or starts. The log files for EC2Launch v2, EC2Launch, and EC2Config contain the output from the standard output and standard error streams.

EC2Launch v2

The log file for EC2Launch v2 is `C:\ProgramData\Amazon\EC2Launch\log\agent.log`.

> **Note**
>
> The `C:\ProgramData` folder might be hidden. To view the folder, you must show hidden files and folders.

The following information is logged when the user data is run:

- `Info: Converting user-data to yaml format` – If the user data was provided in XML format
- `Info: Initialize user-data state` – The start of user data execution
- `Info: Frequency is: always` – If the user data task is running on every boot
- `Info: Frequency is: once` – If the user data task is running just once
- `Stage: postReadyUserData execution completed` – The end of user data execution

EC2Launch

The log file for EC2Launch is `C:\ProgramData\Amazon\EC2-Windows\Launch\Log\UserdataExecution.log`.

The `C:\ProgramData` folder might be hidden. To view the folder, you must show hidden files and folders.

The following information is logged when the user data is run:

- `Userdata execution begins` – The start of user data execution
- `<persist> tag was provided: true` – If the persist tag is found
- `Running userdata on every boot` – If the persist tag is found
- `<powershell> tag was provided.. running powershell content` – If the powershell tag is found
- `<script> tag was provided.. running script content` – If the script tag is found
- `Message: The output from user scripts` – If user data scripts are run, their output is logged

EC2Config

The log file for EC2Config is `C:\Program Files\Amazon\Ec2ConfigService\Logs\Ec2Config.log`. The following information is logged when the user data is run:

- `Ec2HandleUserData: Message: Start running user scripts` – The start of user data execution
- `Ec2HandleUserData: Message: Re-enabled userdata execution` – If the persist tag is found
- `Ec2HandleUserData: Message: Could not find <persist> and </persist>` – If the persist tag is not found
- `Ec2HandleUserData: Message: The output from user scripts` – If user data scripts are run, their output is logged

Run scripts during subsequent reboots or starts

When you update instance user data, the updated user data content is automatically reflected in the instance metadata the next time you reboot or start the instance. However, depending on the installed launch agent, additional configuration may be required to configure user data scripts to run on subsequent reboots or starts.

If you choose the **Shutdown with Sysprep** option, user data scripts run the next time the instance starts or reboots, even if you did not enable user data execution for subsequent reboots or starts.

For instructions to enable user data execution, select the tab that matches your launch agent.

EC2Launch v2

Unlike EC2Launch v1, EC2Launch v2 evaluates the user data task on every boot. It is not necessary to manually schedule the user data task. The user data runs based on the included frequency or persist options.

For XML user data scripts

To run user data scripts on every boot, add the `<persist>true</persist>` flag to the user data. If the persist flag is not included, the user data script only runs on the initial boot.

For YAML user data

- To run a task in user data on the initial boot, set the task `frequency` to `once`.

- To run a task in user data on every boot, set the task `frequency` to `always`.

EC2Launch

1. Connect to your Windows instance.
2. Open a PowerShell command window and run one of the following commands:

   Run once

   To run user data once on the next boot, use the `-Schedule` flag.

   ```
   C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -
   Schedule
   ```

   Run on all subsequent boots

   To run user data on all subsequent boots, use the `-SchedulePerBoot` flag.

   ```
   C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -
   SchedulePerBoot
   ```
3. Disconnect from your Windows instance. To run updated scripts the next time the instance is started, stop the instance and update the user data.

EC2Config

1. Connect to your Windows instance.
2. Open `C:\Program Files\Amazon\Ec2ConfigService \Ec2ConfigServiceSetting.exe`.
3. For **User Data**, select **Enable UserData execution for next service start**.
4. Disconnect from your Windows instance. To run updated scripts the next time the instance is started, stop the instance and update the user data.

User data and the Tools for Windows PowerShell

You can use the Tools for Windows PowerShell to specify, modify, and view the user data for your instance. For information about viewing user data from your instance using instance metadata, see

Access instance metadata for an EC2 instance. For information about user data and the AWS CLI, see User data and the AWS CLI.

Example: Specify instance user data at launch

Create a text file with the instance user data. To run user data scripts every time you reboot or start the instance, add `<persist>true</persist>`, as shown in the following example.

```
<powershell>
    $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

To specify instance user data when you launch your instance, use the New-EC2Instance command. This command does not perform base64 encoding of the user data for you. Use the following commands to encode the user data in a text file named `script.txt`.

```
PS C:\> $Script = Get-Content -Raw script.txt
PS C:\> $UserData =
 [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($Script))
```

Use the `-UserData` parameter to pass the user data to the **New-EC2Instance** command.

```
PS C:\> New-EC2Instance -ImageId ami-abcd1234 -MinCount 1 -MaxCount 1 -
InstanceType m3.medium \
    -KeyName my-key-pair -SubnetId subnet-12345678 -SecurityGroupIds sg-1a2b3c4d \
    -UserData $UserData
```

Example: Update instance user data for a stopped instance

You can modify the user data of a stopped instance using the Edit-EC2InstanceAttribute command.

Create a text file with the new script. Use the following commands to encode the user data in the text file named `new-script.txt`.

```
PS C:\> $NewScript = Get-Content -Raw new-script.txt
PS C:\> $NewUserData =
 [System.Convert]::ToBase64String([System.Text.Encoding]::ASCII.GetBytes($NewScript))
```

Use the `-UserData` and `-Value` parameters to specify the user data.

```
PS C:\> Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -Attribute userData -
Value $NewUserData
```

Example: View instance user data

To retrieve the user data for an instance, use the Get-EC2InstanceAttribute command.

```
PS C:\> (Get-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -Attribute
 userData).UserData
```

The following is example output. Note that the user data is encoded.

```
PHBvd2Vyc2hlbGw
+DQpSZW5hbWUtQ29tcHV0ZXIgLU5ld05hbWUgdXNlci1kYXRhLXRlc3QNCjwvcG93ZXJzaGVsbD4=
```

Use the following commands to store the encoded user data in a variable and then decode it.

```
PS C:\> $UserData_encoded = (Get-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -
Attribute userData).UserData
PS C:
\> [System.Text.Encoding]::UTF8.GetString([System.Convert]::FromBase64String($UserData_encoded)
```

The following is example output.

```
<powershell>
    $file = $env:SystemRoot + "\Temp\" + (Get-Date).ToString("MM-dd-yy-hh-mm")
    New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

Example: Rename the instance to match the tag value

You can use the Get-EC2Tag command to read the tag value, rename the instance on first boot to match the tag value, and reboot. To run this command successfully, you must have a role with `ec2:DescribeTags` permissions attached to the instance because tag information is retrieved by the API call. For more information on settings permissions by using IAM roles, see Attach an IAM role to an instance.

IMDSv2

```
<powershell>
    [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-
seconds" = "21600"} -Method PUT -Uri 'http://169.254.169.254/latest/api/token' -
UseBasicParsing
    $instanceId = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" =
 $token} -Method GET -Uri 'http://169.254.169.254/latest/meta-data/instance-id' -
UseBasicParsing
 $nameValue = (Get-EC2Tag -Filter @{Name="resource-id";Value=
$instanceid},@{Name="key";Value="Name"}).Value
 $pattern = "^(?![0-9]{1,15}$)[a-zA-Z0-9-]{1,15}$"
 #Verify Name Value satisfies best practices for Windows hostnames
 If ($nameValue -match $pattern)
     {Try
         {Rename-Computer -NewName $nameValue -Restart -ErrorAction Stop}
     Catch
         {$ErrorMessage = $_.Exception.Message
         Write-Output "Rename failed: $ErrorMessage"}}
 Else
     {Throw "Provided name not a valid hostname. Please ensure Name value is between
 1 and 15 characters in length and contains only alphanumeric or hyphen characters"}
</powershell>
```

IMDSv1

```
<powershell>
 $instanceId = (Invoke-WebRequest http://169.254.169.254/latest/meta-data/instance-
id -UseBasicParsing).content
 $nameValue = (Get-EC2Tag -Filter @{Name="resource-id";Value=
$instanceid},@{Name="key";Value="Name"}).Value
 $pattern = "^(?![0-9]{1,15}$)[a-zA-Z0-9-]{1,15}$"
 #Verify Name Value satisfies best practices for Windows hostnames
 If ($nameValue -match $pattern)
     {Try
         {Rename-Computer -NewName $nameValue -Restart -ErrorAction Stop}
     Catch
         {$ErrorMessage = $_.Exception.Message
         Write-Output "Rename failed: $ErrorMessage"}}
 Else
     {Throw "Provided name not a valid hostname. Please ensure Name value is between
 1 and 15 characters in length and contains only alphanumeric or hyphen characters"}
</powershell>
```

You can also rename the instance using tags in instance metadata, if your instance is configured to access tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata.

IMDSv2

```
<powershell>
    [string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-
seconds" = "21600"} -Method PUT -Uri 'http://169.254.169.254/latest/api/token' -
UseBasicParsing
 $nameValue = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token}
 -Method GET -Uri 'http://169.254.169.254/latest/meta-data/tags/instance/Name' -
UseBasicParsing
 $pattern = "^(?![0-9]{1,15}$)[a-zA-Z0-9-]{1,15}$"
 #Verify Name Value satisfies best practices for Windows hostnames
 If ($nameValue -match $pattern)
     {Try
         {Rename-Computer -NewName $nameValue -Restart -ErrorAction Stop}
     Catch
         {$ErrorMessage = $_.Exception.Message
         Write-Output "Rename failed: $ErrorMessage"}}
 Else
     {Throw "Provided name not a valid hostname. Please ensure Name value is between
 1 and 15 characters in length and contains only alphanumeric or hyphen characters"}
</powershell>
```

IMDSv1

```
<powershell>
 $nameValue = Get-EC2InstanceMetadata -Path /tags/instance/Name
 $pattern = "^(?![0-9]{1,15}$)[a-zA-Z0-9-]{1,15}$"
 #Verify Name Value satisfies best practices for Windows hostnames
 If ($nameValue -match $pattern)
     {Try
         {Rename-Computer -NewName $nameValue -Restart -ErrorAction Stop}
     Catch
         {$ErrorMessage = $_.Exception.Message
         Write-Output "Rename failed: $ErrorMessage"}}
 Else
     {Throw "Provided name not a valid hostname. Please ensure Name value is between
 1 and 15 characters in length and contains only alphanumeric or hyphen characters"}
</powershell>
```

Identify each instance launched in a single request

This example demonstrates how you can use both user data and instance metadata to configure your Amazon EC2 instances.

> **Note**
>
> The examples in this section use the IPv4 address of the IMDS: `169.254.169.254`. If you are retrieving instance metadata for EC2 instances over the IPv6 address, ensure that you enable and use the IPv6 address instead: `[fd00:ec2::254]`. The IPv6 address of the IMDS is compatible with IMDSv2 commands. The IPv6 address is only accessible on Nitro-based instances in IPv6-supported subnets (dual stack or IPv6 only).

Alice wants to launch four instances of her favorite database AMI, with the first acting as the original instance and the remaining three acting as replicas. When she launches them, she wants to add user data about the replication strategy for each replica. She is aware that this data will be available to all four instances, so she needs to structure the user data in a way that allows each instance to recognize which parts are applicable to it. She can do this using the `ami-launch-index` instance metadata value, which will be unique for each instance. If she starts more than one instance at the same time, the `ami-launch-index` indicates the order in which the instances were launched. The value of the first instance launched is `0`.

Here is the user data that Alice has constructed.

```
replicate-every=1min | replicate-every=5min | replicate-every=10min
```

The `replicate-every=1min` data defines the first replica's configuration, `replicate-every=5min` defines the second replica's configuration, and so on. Alice decides to provide this data as an ASCII string with a pipe symbol (`|`) delimiting the data for the separate instances.

Alice launches four instances using the run-instances command, specifying the user data.

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --count 4 \
    --instance-type t2.micro \
    --user-data "replicate-every=1min | replicate-every=5min | replicate-every=10min"
```

After they're launched, all instances have a copy of the user data and the common metadata shown here:

- AMI ID: ami-0abcdef1234567890
- Reservation ID: r-1234567890abcabc0
- Public keys: none
- Security group name: default
- Instance type: t2.micro

However, each instance has unique metadata, as shown in the following tables.

Metadata	Value
instance-id	i-1234567890abcdef0
ami-launch-index	0
public-hostname	ec2-203-0-113-25.compute-1.amazonaws.eu
public-ipv4	67.202.51.223
local-hostname	ip-10-251-50-12.ec2.internal
local-ipv4	10.251.50.35

Metadata	Value
instance-id	i-0598c7d356eba48d7
ami-launch-index	1
public-hostname	ec2-67-202-51-224.compute-1.amazonaws.eu
public-ipv4	67.202.51.224
local-hostname	ip-10-251-50-36.ec2.internal
local-ipv4	10.251.50.36

Metadata	Value
instance-id	i-0ee992212549ce0e7
ami-launch-index	2
public-hostname	ec2-67-202-51-225.compute-1.amazonaws.eu
public-ipv4	67.202.51.225
local-hostname	ip-10-251-50-37.ec2.internal
local-ipv4	10.251.50.37

Metadata	Value
instance-id	i-1234567890abcdef0
ami-launch-index	3
public-hostname	ec2-67-202-51-226.compute-1.amazonaws.eu
public-ipv4	67.202.51.226
local-hostname	ip-10-251-50-38.ec2.internal
local-ipv4	10.251.50.38

Alice can use the `ami-launch-index` value to determine which portion of the user data is applicable to a particular instance.

1. She connects to one of the instances, and retrieves the `ami-launch-index` for that instance to ensure it is one of the replicas:

   IMDSv2

   ```
   [ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/meta-data/api/
   token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
   ```

```
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-
data/ami-launch-index
2
```

For the following steps, the IMDSv2 requests use the stored token from the preceding IMDSv2 command, assuming the token has not expired.

IMDSv1

```
[ec2-user ~]$ curl http://169.254.169.254/latest/meta-data/ami-launch-index
2
```

2. She saves the `ami-launch-index` as a variable.

   IMDSv2

   ```
   [ec2-user ~]$ ami_launch_index=`curl -H "X-aws-ec2-metadata-token: $TOKEN"
    http://169.254.169.254/latest/meta-data/ami-launch-index`
   ```

   IMDSv1

   ```
   [ec2-user ~]$ ami_launch_index=`curl http://169.254.169.254/latest/meta-data/ami-
   launch-index`
   ```

3. She saves the user data as a variable.

   IMDSv2

   ```
   [ec2-user ~]$ user_data=`curl -H "X-aws-ec2-metadata-token: $TOKEN"
    http://169.254.169.254/latest/user-data`
   ```

   IMDSv1

   ```
   [ec2-user ~]$ user_data=`curl http://169.254.169.254/latest/user-data`
   ```

4. Finally, Alice uses the **cut** command to extract the portion of the user data that is applicable to that instance.

   IMDSv2

   ```
   [ec2-user ~]$ echo $user_data | cut -d"|" -f"$ami_launch_index"
   replicate-every=5min
   ```

IMDSv1

```
[ec2-user ~]$ echo $user_data | cut -d"|" -f"$ami_launch_index"
replicate-every=5min
```

Detect whether a host is an EC2 instance

You might need to know whether your application or website is running on an EC2 instance, especially if you have a mixed computing environment. You can use one of the following options to determine whether the host for your application or website is an EC2 instance.

Options

- Inspect the instance identity document
- Inspect the system UUID
- Inspect the system virtual machine generation identifier

Inspect the instance identity document

Each instance has a signed instance identity document that you can verify cryptographically. You can find these documents using the Instance Metadata Service (IMDS).

For more information, see Instance identity documents.

Inspect the system UUID

You can get the system UUID and look in the beginning octet of the UUID for EC2 (in Linux, this might be lowercase ec2). This method is quick, but potentially inaccurate because there's a small chance that a system that is not an EC2 instance could have a UUID that starts with these characters. Furthermore, some versions of SMBIOS use the *little-endian* format, which doesn't include EC2 at the beginning of the UUID. This might be the case for EC2 instances that use SMBIOS 2.4 for Windows, or for Linux distributions other than Amazon Linux that have their own implementation of SMBIOS.

Linux example: Get the UUID from DMI (HVM AMIs only)

Use the following command to get the UUID using the Desktop Management Interface (DMI):

```
[ec2-user ~]$ sudo dmidecode --string system-uuid
```

In the following example output, the UUID starts with "EC2", which indicates that the system is probably an EC2 instance.

```
EC2E1916-9099-7CAF-FD21-012345ABCDEF
```

In the following example output, the UUID is represented in little-endian format.

```
45E12AEC-DCD1-B213-94ED-012345ABCDEF
```

Alternatively, for instances built on the Nitro system, you can use the following command:

```
[ec2-user ~]$ cat /sys/devices/virtual/dmi/id/board_asset_tag
```

If the output is an instance ID, as the following example output, the system is an EC2 instance:

```
i-0af01c0123456789a
```

Linux example: Get the UUID from the hypervisor (PV AMIs only)

Use the following command to get the UUID from the hypervisor:

```
[ec2-user ~]$ cat /sys/hypervisor/uuid
```

In the following example output, the UUID starts with "ec2", which indicates that the system is probably an EC2 instance.

```
ec2e1916-9099-7caf-fd21-012345abcdef
```

Windows example: Get the UUID using WMI or Windows PowerShell

Use the Windows Management Instrumentation command line (WMIC) as follows:

```
wmic path win32_computersystemproduct get uuid
```

Alternatively, if you're using Windows PowerShell, use the **Get-WmiObject** cmdlet as follows:

```
PS C:\> Get-WmiObject -query "select uuid from Win32_ComputerSystemProduct" | Select
 UUID
```

In the following example output, the UUID starts with "EC2", which indicates that the system is probably an EC2 instance.

```
EC2AE145-D1DC-13B2-94ED-012345ABCDEF
```

For instances using SMBIOS 2.4, the UUID might be represented in little-endian format; for example:

```
45E12AEC-DCD1-B213-94ED-012345ABCDEF
```

Inspect the system virtual machine generation identifier

A virtual machine generation identifier consists of a unique buffer of 128-bit interpreted as cryptographic random integer identifier. You can retrieve the virtual machine generation identifier to identify your Amazon Elastic Compute Cloud instance. The generation identifier is exposed within the guest operating system of the instance through an ACPI table entry. The value will change if your machine is cloned, copied, or imported into AWS, such as with VM Import/Export.

Example: Retrieve the virtual machine generation identifier from Linux

You can use the following commands to retrieve the virtual machine generation identifier from your instances running Linux.

Amazon Linux 2

1. Update your existing software packages, as necessary, using the following command:

   ```
   sudo yum update
   ```

2. If necessary, source the busybox package with the following command:

   ```
   sudo curl https://www.rpmfind.net/linux/epel/next/8/Everything/x86_64/Packages/
   b/busybox-1.35.0-2.el8.next.x86_64.rpm --output busybox.rpm
   ```

3. If necessary, install the prerequisite packages using the following command:

```
sudo yum install busybox.rpm iasl -y
```

4. Run the following `iasl` command to produce output from the ACPI table:

```
sudo iasl -p ./SSDT2 -d /sys/firmware/acpi/tables/SSDT2
```

5. Run the following command to review the output of the `iasl` command:

```
cat SSDT2.dsl
```

The output should yield the address space required to retrieve the virtual machine generation identifier:

```
Intel ACPI Component Architecture

```

Your output should be similar to the following:

```
EC2F335D979132C4165896753E72BD1C
```

Example: Retrieve the virtual machine generation identifier from Windows

You can create a sample application to retrieve the virtual machine generation identifier from your instances running Windows. For more information, see Obtaining the virtual machine generation identifier in the Microsoft documentation.

Instance identity documents for Amazon EC2 instances

Each instance that you launch has an instance identity document that provides information about the instance itself. You can use the instance identity document to validate the attributes of the instance.

The instance identity document is generated when the instance is stopped and started, restarted, or launched. You can access the instance identity document for an instance through the Instance Metadata Service (IMDS). For the instructions, see Retrieve the instance identity document.

The instance identity document uses plaintext JSON format. It includes the following information.

Data	Description
`accountId`	The ID of the AWS account that launched the instance.
`architecture`	The architecture of the AMI used to launch the instance (i386 | x86_64 | arm64).
`availabilityZone`	The name of the Availability Zone in which the instance is running. For example, `us-east-1` . Keep in mind that Availability Zone names might differ across AWS accounts.
`billingProducts`	The billing products of the instance.
`devpayProductCodes`	Deprecated.
`imageId`	The ID of the AMI used to launch the instance.
`instanceId`	The ID of the instance.
`instanceType`	The instance type of the instance.
`kernelId`	The ID of the kernel associated with the instance, if applicable.
`marketplaceProductCodes`	The AWS Marketplace product code of the AMI used to launch the instance.
`pendingTime`	The date and time that the instance was launched.
`privateIp`	The private IP address of the instance. For IPv4-only and dual-stack instances, this contains the IPv4 address. For IPv6-only instances, this contains the IPv6 address.
`ramdiskId`	The ID of the RAM disk associated with the instance, if applicable.

Data	Description
`region`	The Region in which the instance is running.
`version`	The version of the instance identity document format.

Retrieve the instance identity document for an EC2 instance

The instance identity document for an Amazon EC2 instance uses a plaintext JSON format. For a description of the contents of an instance identity document, see the section called “Instance identity documents”.

The instance identity document is stored in the instance metadata for the instance, in the `instance-identity/document` dynamic data category. You access the instance identity document for an instance by connecting to the instance and retrieving it from the instance metadata.

You can access instance metadata using the IPv4 address 169.254.169.254 or the IPv6 address fd00:ec2::254. These are Link-local addresses, meaning that you can access them only from the instance. The examples on this page use the IPv4 address of the IMDS: 169.254.169.254. To retrieve instance metadata for EC2 instances over IPv6, use fd00:ec2::254.

To verify the authenticity of an instance identity document after you retrieve it, see Verify instance identity document.

IMDSv2

Linux

Run the following command from your Linux instance to retrieve the instance identity document.

```
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
    && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/dynamic/instance-identity/document
```

Windows

Run the following cmdlet from your Windows instance to retrieve the instance identity document.

```
[string]$token = (Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token-ttl-
seconds' = '21600'} `
    -Method PUT -Uri 'http://169.254.169.254/latest/api/token' -
UseBasicParsing).Content
```

```
(Invoke-WebRequest -Headers @{'X-aws-ec2-metadata-token' = $token} `
    -Uri 'http://169.254.169.254/latest/dynamic/instance-identity/document' -
UseBasicParsing).Content
```

IMDSv1

Linux

Run the following command from your Linux instance to retrieve the instance identity document.

```
curl http://169.254.169.254/latest/dynamic/instance-identity/document
```

Windows

Run the following cmdlet from your Windows instance to retrieve the instance identity document.

```
(Invoke-WebRequest http://169.254.169.254/latest/dynamic/instance-identity/
document).Content
```

The following is example output.

```
{
    "devpayProductCodes" : null,
    "marketplaceProductCodes" : [ "1abc2defghijklm3nopqrs4tu" ],
    "availabilityZone" : "us-west-2b",
    "privateIp" : "10.158.112.84",
    "version" : "2017-09-30",
    "instanceId" : "i-1234567890abcdef0",
    "billingProducts" : null,
    "instanceType" : "t2.micro",
```

```
    "accountId" : "123456789012",
    "imageId" : "ami-5fb8c835",
    "pendingTime" : "2016-11-19T16:32:11Z",
    "architecture" : "x86_64",
    "kernelId" : null,
    "ramdiskId" : null,
    "region" : "us-west-2"
}
```

Verify the instance identity document for an Amazon EC2 instance

If you intend to use the contents of the instance identity document for an important purpose, you should verify its contents and authenticity before using it.

The plaintext instance identity document is accompanied by three hashed and encrypted signatures. You can use these signatures to verify the origin and authenticity of the instance identity document and the information that it includes. The following signatures are provided:

- Base64-encoded signature—This is a base64-encoded SHA256 hash of the instance identity document that is encrypted using an RSA key pair.
- PKCS7 signature—This is a SHA1 hash of the instance identity document that is encrypted using a DSA key pair.
- RSA-2048 signature—This is a SHA256 hash of the instance identity document that is encrypted using an RSA-2048 key pair.

Each signature is available at a different endpoint in the instance metadata. You can use any one of these signatures depending on your hashing and encryption requirements. To verify the signatures, you must use the corresponding AWS public certificate.

Options

- Option 1: Verify instance identity document using the PKCS7 signature
- Option 2: Verify instance identity document using the base64-encoded signature
- Option 3: Verify instance identity document using the RSA-2048 signature

Option 1: Verify instance identity document using the PKCS7 signature

This topic explains how to verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate.

Linux instances

To verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate

1. Connect to the instance.
2. Retrieve the PKCS7 signature from the instance metadata and add it to a new file named `pkcs7` along with the required header and footer. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   $ echo "-----BEGIN PKCS7-----" >> pkcs7 \
    && TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-
   metadata-token-ttl-seconds: 21600"` \
    && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
   dynamic/instance-identity/pkcs7 >> pkcs7 \
    && echo "" >> pkcs7 \
    && echo "-----END PKCS7-----" >> pkcs7
   ```

   IMDSv1

   ```
   $ echo "-----BEGIN PKCS7-----" >> pkcs7 \
    && curl -s http://169.254.169.254/latest/dynamic/instance-identity/pkcs7
    >> pkcs7 \
    && echo "" >> pkcs7 \
    && echo "-----END PKCS7-----" >> pkcs7
   ```

3. Find the **DSA** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate`.
4. Use the **OpenSSL smime** command to verify the signature. Include the `-verify` option to indicate that the signature needs to be verified, and the `-noverify` option to indicate that the certificate does not need to be verified.

   ```
   $ openssl smime -verify -in pkcs7 -inform PEM -certfile certificate -noverify | tee
    document
   ```

   If the signature is valid, the `Verification successful` message appears.

The command also writes the contents of the instance identity document to a new file named `document`. You can compare the contents of the of the instance identity document from the instance metadata with the contents of this file using the following commands.

```
$ openssl dgst -sha256 < document
```

```
$ curl -s -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
dynamic/instance-identity/document | openssl dgst -sha256
```

If the signature cannot be verified, contact Support.

Windows instances

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

> **Note**
>
> The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the PKCS7 signature and the AWS DSA public certificate

1. Connect to the instance.
2. Retrieve the PKCS7 signature from the instance metadata, convert it to a byte array, and add it to a variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-ec2-
metadata-token-ttl-seconds' = '21600'} -Uri http://169.254.169.254/latest/api/
token).Content
```

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers
 @{'X-aws-ec2-metadata-token' = $Token} -Uri http://169.254.169.254/latest/
dynamic/instance-identity/pkcs7).Content)
```

IMDSv1

```
PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Uri
 http://169.254.169.254/latest/dynamic/instance-identity/pkcs7).Content)
```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named `$Document`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers
    @{'X-aws-ec2-metadata-token' = $Token} -Uri http://169.254.169.254/latest/
   dynamic/instance-identity/document).Content)
   ```

   IMDSv1

   ```
   PS C:\> $Document =  [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest
    http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
   ```

4. Find the **DSA** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate.pem`.

5. Extract the certificate from the certificate file and store it in a variable named `$Store`.

   ```
   PS C:\> $Store =
    [Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptog
   Path certificate.pem)))
   ```

6. Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns `Exception calling "CheckSignature" with "2" argument(s): "Cannot find the original signer`. If your signature cannot be verified, contact AWS Support.

7. Validate the content of the instance identity document.

```
PS C:
\> [Linq.Enumerable]::SequenceEqual($SignatureDocument.ContentInfo.Content, $Document)
```

If the content of the instance identity document is valid, the command returns `True`. If instance identity document can't be validated, contact AWS Support.

Option 2: Verify instance identity document using the base64-encoded signature

This topic explains how to verify the instance identity document using the base64-encoded signature and the AWS RSA public certificate.

Linux instances

To validate the instance identity document using the base64-encoded signature and the AWS RSA public certificate

1. Connect to the instance.
2. Retrieve the base64-encoded signature from the instance metadata, convert it to binary, and add it to a file named `signature`. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-
metadata-token-ttl-seconds: 21600"` \
 && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
dynamic/instance-identity/signature | base64 -d >> signature
```

IMDSv1

```
$ curl -s http://169.254.169.254/latest/dynamic/instance-identity/signature |
 base64 -d >> signature
```

3. Retrieve the plaintext instance identity document from the instance metadata and add it to a file named `document`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   $ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-
   metadata-token-ttl-seconds: 21600"` \
    && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
   dynamic/instance-identity/document >> document
   ```

   IMDSv1

   ```
   $ curl -s http://169.254.169.254/latest/dynamic/instance-identity/document
    >> document
   ```

4. Find the **RSA** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate`.

5. Extract the public key from the AWS RSA public certificate and save it to a file named `key`.

   ```
   $ openssl x509 -pubkey -noout -in certificate >> key
   ```

6. Use **OpenSSL dgst** command to verify the instance identity document.

   ```
   $ openssl dgst -sha256 -verify key -signature signature document
   ```

   If the signature is valid, the `Verification successful` message appears.

The command also writes the contents of the instance identity document to a new file named `document`. You can compare the contents of the of the instance identity document from the instance metadata with the contents of this file using the following commands.

```
$ openssl dgst -sha256 < document
```

```
$ curl -s -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
dynamic/instance-identity/document | openssl dgst -sha256
```

If the signature cannot be verified, contact Support.

Windows instances

To validate the instance identity document using the base64-encoded signature and the AWS RSA public certificate

1. Connect to the instance.
2. Retrieve the base64-encoded signature from the instance metadata, convert it to a byte array, and add it to variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-
   ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/
   token).Content
   ```

   ```
   PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers
    @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/
   instance-identity/signature).Content)
   ```

   IMDSv1

   ```
   PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest
    http://169.254.169.254/latest/dynamic/instance-identity/signature).Content)
   ```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named `$Document`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers
    @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/
   instance-identity/document).Content)
   ```

   IMDSv1

   ```
   PS C:\> $Document =  [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest
    http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
   ```

4. Find the **RSA** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate.pem`.
5. Verify the instance identity document.

   ```
   PS C:\> [Security.Cryptography.X509Certificates.X509Certificate2]::new((Resolve-
   Path certificate.pem)).PublicKey.Key.VerifyData($Document, 'SHA256', $Signature)
   ```

   If the signature is valid, the command returns `True`. If the signature cannot be verified, contact Support.

Option 3: Verify instance identity document using the RSA-2048 signature

This topic explains how to verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate.

Linux instances

To verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate

1. Connect to the instance.
2. Retrieve the RSA-2048 signature from the instance metadata and add it to a file named `rsa2048` along the required header and footer. Use one of the following commands depending on the IMDS version used by the instance.

IMDSv2

```
$ echo "-----BEGIN PKCS7-----" >> rsa2048 \
 && TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-
metadata-token-ttl-seconds: 21600"` \
 && curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
dynamic/instance-identity/rsa2048 >> rsa2048 \
 && echo "" >> rsa2048 \
 && echo "-----END PKCS7-----" >> rsa2048
```

IMDSv1

```
$ echo "-----BEGIN PKCS7-----" >> rsa2048 \
 && curl -s http://169.254.169.254/latest/dynamic/instance-identity/rsa2048
 >> rsa2048 \
 && echo "" >> rsa2048 \
 && echo "-----END PKCS7-----" >> rsa2048
```

3. Find the **RSA-2048** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate`.
4. Use the **OpenSSL smime** command to verify the signature. Include the `-verify` option to indicate that the signature needs to be verified, and the `-noverify` option to indicate that the certificate does not need to be verified.

   ```
   $ openssl smime -verify -in rsa2048 -inform PEM -certfile certificate -noverify |
    tee document
   ```

   If the signature is valid, the `Verification successful` message appears. If the signature cannot be verified, contact Support.

Windows instances

Prerequisites

This procedure requires the `System.Security` Microsoft .NET Core class. To add the class to your PowerShell session, run the following command.

```
PS C:\> Add-Type -AssemblyName System.Security
```

> **Note**
>
> The command adds the class to the current PowerShell session only. If you start a new session, you must run the command again.

To verify the instance identity document using the RSA-2048 signature and the AWS RSA-2048 public certificate

1. Connect to the instance.
2. Retrieve the RSA-2048 signature from the instance metadata, convert it to a byte array, and add it to a variable named `$Signature`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   PS C:\> [string]$token = (Invoke-WebRequest -Method Put -Headers @{'X-aws-
   ec2-metadata-token-ttl-seconds' = '21600'} http://169.254.169.254/latest/api/
   token).Content
   ```

   ```
   PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest -Headers
    @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/
   instance-identity/rsa2048).Content)
   ```

   IMDSv1

   ```
   PS C:\> $Signature = [Convert]::FromBase64String((Invoke-WebRequest
    http://169.254.169.254/latest/dynamic/instance-identity/rsa2048).Content)
   ```

3. Retrieve the plaintext instance identity document from the instance metadata, convert it to a byte array, and add it to a variable named `$Document`. Use one of the following commands depending on the IMDS version used by the instance.

   IMDSv2

   ```
   PS C:\> $Document = [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest -Headers
    @{'X-aws-ec2-metadata-token' = $Token} http://169.254.169.254/latest/dynamic/
   instance-identity/document).Content)
   ```

IMDSv1

```
PS C:\> $Document =  [Text.Encoding]::UTF8.GetBytes((Invoke-WebRequest
 http://169.254.169.254/latest/dynamic/instance-identity/document).Content)
```

4. Find the **RSA-2048** public certificate for your Region in AWS public certificates for instance identity document signatures and add the contents to a new file named `certificate.pem`.
5. Extract the certificate from the certificate file and store it in a variable named `$Store`.

```
PS C:\> $Store =
 [Security.Cryptography.X509Certificates.X509Certificate2Collection]::new([Security.Cryptog
Path certificate.pem)))
```

6. Verify the signature.

```
PS C:\> $SignatureDocument = [Security.Cryptography.Pkcs.SignedCms]::new()
```

```
PS C:\> $SignatureDocument.Decode($Signature)
```

```
PS C:\> $SignatureDocument.CheckSignature($Store, $true)
```

If the signature is valid, the command returns no output. If the signature cannot be verified, the command returns `Exception calling "CheckSignature" with "2" argument(s): "Cannot find the original signer`. If your signature cannot be verified, contact AWS Support.

7. Validate the content of the instance identity document.

```
PS C:
\> [Linq.Enumerable]::SequenceEqual($SignatureDocument.ContentInfo.Content, $Document)
```

If the content of the instance identity document is valid, the command returns `True`. If instance identity document can't be validated, contact AWS Support.

AWS public certificates for instance identity document signatures

The following AWS public certificates can be used to verify the contents of an instance's instance identity document as described in Verify instance identity document.

Ensure that you use the correct certificate for your Region and for the verification procedure that you're using. If you're verifying the PKCS7 signature, use the DSA certificate. If you're verifying the base64-encoded signature, use the RSA certificate. If you're verifying the RSA-2048 signature, use the RSA-2048 certificate.

Expand each Region below to view the Region-specific certificates.

AWS European Sovereign Cloud — eusc-de-east-1

STIG compliance for your EC2 instance

Security Technical Implementation Guides (STIGs) are the configuration hardening standards created by the Defense Information Systems Agency (DISA) to secure information systems and

software. To make your systems compliant with STIG standards, you must install, configure, and test a variety of security settings.

STIGs are applied based on the following vulnerability classifications. When you create a STIG hardened image or apply STIG settings to an existing instance, you can choose which level to apply for hardening. Higher levels include STIG settings from all lower levels. For example, the *High (Category I)* level includes settings from both the Medium and Low categories.

Compliance levels

- **High (Category I)**

  The most severe risk. Includes any vulnerability that can result in loss of confidentiality, availability, or integrity.
- **Medium (Category II)**

  Includes any vulnerability that can result in loss of confidentiality, availability, or integrity but the risk can be mitigated.
- **Low (Category III)**

  Includes any vulnerability that degrades measures to protect against loss of confidentiality, availability, or integrity.

Amazon EC2 provides the following methods to create STIG hardened instances:

- You can launch Windows instances that are pre-configured for STIG hardening from specialized public AWS Windows AMIs. For more information, see STIG Hardened AWS Windows Server AMIs in the *AWS Windows AMI reference*.
- You can create a customized AMI to launch pre-configured instances that are built with EC2 Image Builder STIG hardening components. For more information, see STIG hardening components in the *Image Builder User Guide*.
- You can use the AWSEC2-ConfigureSTIG Systems Manager command document to apply STIG settings to an existing EC2 instance. The Systems Manager STIG command document scans for misconfigurations and runs a remediation script to install and update the DoD certificates and to remove unnecessary certificates to maintain STIG compliance. There are no additional charges for using the STIG Systems Manager document.

Topics

- STIG hardening settings for EC2 instances
- STIG hardening script downloads
- Use AWS Systems Manager to apply STIG settings to your instance

STIG hardening settings for EC2 instances

STIG settings vary based on your instance operating system and the compliance level that you choose. The following content contains system-specific details for STIGs that are applied at each compliance level.

Contents

- STIG settings for EC2 Linux instances
- STIG hardening settings for EC2 Windows instances

STIG settings for EC2 Linux instances

This section contains information about the Linux STIG hardening settings that Amazon EC2 supports. The hardening script applies supported STIG settings to the infrastructure based on the Linux distribution. If the Linux distribution doesn't have STIG hardening settings of its own, Amazon EC2 uses RHEL settings, as follows.

- Red Hat Enterprise Linux (RHEL) 7 STIG settings
  - RHEL 7
  - CentOS 7
  - Amazon Linux 2 (AL2)
- RHEL 8 STIG settings
  - RHEL 8
  - CentOS 8
- RHEL 9 STIG settings
  - RHEL 9
  - CentOS Stream 9

Linux STIG Low (Category III)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers. Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

RHEL 7 STIG Version 3 Release 15

- **RHEL 7/CentOS 7/AL2**

  V-204452, V-204576, and V-204605

RHEL 8 STIG Version 2 Release 6

- **RHEL 8/CentOS 8**

  V-230241, V-230269, V-230270, V-230281, V-230285, V-230346, V-230381, V-230395, V-230468, V-230469, V-230485, V-230486, V-230491, V-230494, V-230495, V-230496, V-230497, V-230498, V-230499, and V-244527

RHEL 9 STIG Version 2 Release 7

- **RHEL 9/CentOS Stream 9**

  V-257782, V-257795, V-257796, V-257824, V-257880, V-257946, V-257947, V-258037, V-258067, V-258069, V-258076, V-258138, and V-258173

RHEL 10 STIG Version 1 Release 1

V-280995, V-281203, and V-281292

Amazon Linux 2023 STIG Version 1 Release 1

V-274141

SLES 12 STIG Version 3 Release 4

V-217108, V-217113, V-217140, V-217198, V-217209, V-217211, V-217212, V-217213, V-217214, V-217215, V-217216, V-217236, V-217237, V-217238, V-217239, V-217282, and V-255915

SLES 15 STIG Version 2 Release 6

V-234811, V-234850, V-234868, V-234873, V-234905, V-234907, V-234908, V-234909, V-234933, V-234934, V-234935, V-234936, V-234955, V-234963, V-234967, and V-255921

Ubuntu 18.04 STIG Version 2 Release 15

V-219163, V-219164, V-219165, V-219172, V-219173, V-219174, V-219175, V-219178, V-219179, V-219180, V-219210, V-219301, V-219327, V-219332, and V-219333

Ubuntu 20.04 STIG Version 2 Release 4

V-238202, V-238203, V-238221, V-238222, V-238223, V-238224, V-238226, V-238234, V-238235, V-238237, V-238308, V-238323, V-238357, V-238362, and V-238373

Ubuntu 22.04 STIG Version 2 Release 7

V-260472, V-260476, V-260479, V-260480, V-260481, V-260520, V-260521, V-260549, V-260550, V-260551, V-260552, V-260581, and V-260596

Ubuntu 24.04 STIG Version 1 Release 4

V-270645, V-270646, V-270664, V-270677, V-270690, V-270695, V-270706, V-270710, V-270734, V-270749, V-270752, V-270818, and V-270820

Linux STIG Medium (Category II)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers. Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

> **Note**
>
> The Linux STIG Medium category includes all of the listed STIG hardening settings that apply for Linux STIG Low (Category III), in addition to the STIG hardening settings that Amazon EC2 supports for Category II vulnerabilities.

RHEL 7 STIG Version 3 Release 15

Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

- **RHEL 7/CentOS 7/AL2**

  V-204405, V-204406, V-204407, V-204408, V-204409, V-204410, V-204411, V-204412, V-204413, V-204414, V-204415, V-204416, V-204417, V-204418, V-204420, V-204422, V-204423, V-204426, V-204427, V-204431, V-204434, V-204435, V-204437, V-204449, V-204450, V-204451, V-204457, V-204466, V-204490, V-204491, V-204503, V-204507, V-204508, V-204510, V-204511, V-204512, V-204514, V-204515, V-204516, V-204517, V-204521, V-204524, V-204531, V-204536, V-204537, V-204538, V-204539, V-204540, V-204541, V-204542, V-204543, V-204544, V-204545, V-204546, V-204547, V-204548, V-204549, V-204550, V-204551, V-204552, V-204553, V-204554, V-204555, V-204556, V-204557, V-204558, V-204559, V-204560, V-204562, V-204563, V-204564, V-204565, V-204566, V-204567, V-204568, V-204572, V-204579, V-204584, V-204585, V-204587, V-204588, V-204589, V-204590, V-204591, V-204592, V-204593, V-204596, V-204597, V-204598, V-204599, V-204600, V-204601, V-204602, V-204609, V-204610, V-204611, V-204612, V-204613, V-204614, V-204615, V-204616, V-204617, V-204619, V-204622, V-204625, V-204630, V-204631, V-204633, V-233307, V-237634, V-237635, V-251703, V-255925, V-255927, V-255928, and V-256970

RHEL 8 STIG Version 2 Release 6

Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

- **RHEL 8/CentOS 8**

Ubuntu 20.04 STIG Version 2 Release 4

Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

V-238200, V-238205, V-238207, V-238209, V-238210, V-238211, V-238212, V-238213, V-238220, V-238225, V-238227, V-238228, V-238229, V-238230, V-238231, V-238232, V-238236, V-238238, V-238239, V-238240, V-238241, V-238242, V-238244, V-238245, V-238246, V-238247, V-238248, V-238249, V-238250, V-238251, V-238252, V-238253, V-238254, V-238255, V-238256, V-238257, V-238258, V-238264, V-238268, V-238271, V-238277, V-238278, V-238279, V-238280, V-238281, V-238282, V-238283, V-238284, V-238285, V-238286, V-238287, V-238288, V-238289, V-238290, V-238291, V-238292, V-238293, V-238294, V-238295, V-238297, V-238298, V-238299, V-238300, V-238301, V-238302, V-238303, V-238304, V-238309, V-238310, V-238315, V-238316, V-238317, V-238318, V-238319, V-238320, V-238324, V-238325, V-238329, V-238330, V-238333, V-238334, V-238337, V-238338, V-238339, V-238340, V-238341, V-238342, V-238343, V-238344, V-238345, V-238346, V-238347, V-238348, V-238349, V-238350, V-238351, V-238352, V-238353, V-238355, V-238356, V-238359, V-238360, V-238369, V-238370, V-238371, V-238376, V-238377, V-238378, V-251505, V-255912, V-274852, and V-274853

Ubuntu 22.04 STIG Version 2 Release 7

Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

V-260471, V-260473, V-260474, V-260475, V-260475, V-260477, V-260478, V-260485, V-260486, V-260487, V-260488, V-260489, V-260490, V-260491, V-260492, V-260493, V-260494, V-260495, V-260496, V-260497, V-260498, V-260499, V-260500, V-260505, V-260506, V-260507, V-260508, V-260509, V-260510, V-260511, V-260512, V-260513, V-260514, V-260522, V-260527, V-260528, V-260530, V-260533, V-260534, V-260535, V-260537, V-260538, V-260540, V-260542, V-260543, V-260545, V-260546, V-260547, V-260553, V-260554, V-260555, V-260556, V-260557, V-260560, V-260561, V-260562, V-260563, V-260564, V-260565, V-260566, V-260567, V-260569, V-260572, V-260573, V-260574, V-260575, V-260576, V-260582, V-260584, V-260585, V-260586, V-260588, V-260589, V-260590, V-260591, V-260594, V-260597, V-260598, V-260599, V-260600, V-260601, V-260602, V-260603, V-260604, V-260605, V-260606, V-260607, V-260608, V-260609, V-260610, V-260611, V-260612, V-260613, V-260614, V-260615, V-260616, V-260617, V-260618, V-260619, V-260620, V-260621, V-260622, V-260623, V-260624, V-260625, V-260626, V-260627, V-260628, V-260629, V-260630, V-260631, V-260632, V-260633, V-260634, V-260635, V-260636, V-260637, V-260638, V-260639, V-260640, V-260641, V-260642, V-260643, V-260644, V-260645, V-260646, V-260647, V-260648, V-260649, V-274862, V-274864, and V-274866

Ubuntu 24.04 STIG Version 1 Release 4

Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

V-270649, V-270651, V-270652, V-270653, V-270654, V-270656, V-270657, V-270659, V-270660, V-270661, V-270662, V-270663, V-270669, V-270672, V-270673, V-270674, V-270676, V-270678, V-270679, V-270680, V-270681, V-270683, V-270684, V-270685, V-270686, V-270687, V-270688, V-270689, V-270692, V-270693, V-270696, V-270697, V-270698, V-270699, V-270700, V-270701, V-270702, V-270703, V-270704, V-270705, V-270709, V-270715, V-270716, V-270718, V-270720, V-270721, V-270722, V-270723, V-270724, V-270725, V-270726, V-270727, V-270728, V-270729, V-270730, V-270731, V-270732, V-270733, V-270737, V-270739, V-270740, V-270741, V-270742, V-270743, V-270746, V-270750, V-270753, V-270755, V-270756, V-270757, V-270758, V-270759, V-270760, V-270765, V-270766, V-270767, V-270768, V-270769, V-270770, V-270771, V-270772, V-270773, V-270775, V-270776, V-270777, V-270778, V-270779, V-270780, V-270781, V-270782, V-270783, V-270784, V-270785, V-270786, V-270787, V-270788, V-270789, V-270790, V-270791, V-270792, V-270793, V-270794, V-270795, V-270796, V-270797, V-270798, V-270799, V-270800, V-270801, V-270802, V-270803, V-270804, V-270805, V-270806, V-270807, V-270808, V-270809, V-270810, V-270811, V-270812, V-270813, V-270814, V-270815, V-270821, V-270822, V-270823, V-270824, V-270825, V-270826, V-270827, V-270828, V-270829, V-270830, V-270831, V-270832, V-274870, V-274871, V-274872, and V-274873

Linux STIG High (Category I)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers. Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

Note

The Linux STIG High category includes all of the listed STIG hardening settings that apply for Linux STIG Medium and Low categories, in addition to the STIG hardening settings that Amazon EC2 supports for Category I vulnerabilities.

RHEL 7 STIG Version 3 Release 15

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

- **RHEL 7/CentOS 7/AL2**

  V-204424, V-204425, V-204442, V-204443, V-204447, V-204448, V-204455, V-204462, V-204497, V-204497, V-204502, V-204594, V-204620, and V-204621

RHEL 8 STIG Version 2 Release 6

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

- **RHEL 8/CentOS 8**

  V-230223, V-230264, V-230283, V-230284, V-230487, V-230492, V-230533, V-230558, V-244540, V-279933, V-230265, V-230226, V-230530, V-268322, V-230529, and V-230531

RHEL 9 STIG Version 2 Release 7

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

- **RHEL 9/CentOS Stream 9**

  V-257820, V-257821, V-257826, V-257835, V-257955, V-257956, V-258059, V-258230, V-258238, V-257984, V-257986, V-258078, V-258094, V-258235, V-257784, and V-257785

RHEL 10 Version 1 Release 1

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-280932, V-280933, V-280934, V-280944, V-280949, V-280951, V-280978, V-281007, V-281014, V-281015, V-281216, V-281222, V-281223, V-281267, V-281268, V-281275, V-281298, V-281299, and V-281307

Amazon Linux 2023 STIG Version 1 Release 2

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-273996, V-273997, V-273999, V-274007, V-274038, V-274039, V-274046, V-274052, V-274057, and V-274153

SLES 12 STIG Version 3 Release 4

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-217101, V-217139, V-217141, V-217142, V-217159, V-217160, V-217164, V-217264, V-217268, V-222386, and V-251721

SLES 15 STIG Version 2 Release 6

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-234800, V-234804, V-234818, V-234852, V-234859, V-234860, V-234898, V-234984, V-234985, V-234988, V-234989, V-234990, V-235031, V-235032, and V-251725

Ubuntu 18.04 STIG Version 2 Release 15

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-219157, V-219158, V-219177, V-219212, V-219308, V-219314, V-219316, and V-251507

Ubuntu 20.04 STIG Version 2 Release 4

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-238201, V-238218, V-238219, V-238326, V-238327, V-238380, and V-251504

Ubuntu 22.04 STIG Version 2 Release 7

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-260469, V-260482, V-260483, V-260523, V-260524, V-260526, V-260529, V-260539, V-260570, V-260571, V-260579, and V-279937

Ubuntu 24.04 STIG Version 1 Release 4

Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

V-270647, V-270648, V-270665, V-270666, V-270708, V-270711, V-270712, V-270713, V-270714, V-270717, V-270736, V-270738, and V-279938

STIG hardening settings for EC2 Windows instances

Amazon EC2 supports STIG baselines for the following Windows operating system versions:

- Windows Server 2025
- Windows Server 2022
- Windows Server 2019
- Windows Server 2016
- Windows Server 2012 R2

This section lists current STIG settings that Amazon EC2 supports for your Windows infrastructure, followed by a version history log.

You can apply low, medium, or high STIG settings.

Windows STIG Low (Category III)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers.

Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list of Windows STIGs, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

- **Windows Server 2025 STIG Version 1 Release 1**

  V-278082, V-278083, V-278084, V-278085, V-278098, V-278104, V-278110, and V-278231
- **Windows Server 2022 STIG Version 2 Release 7**

  V-254335, V-254336, V-254337, V-254338, V-254351, V-254357, V-254363, and V-254481
- **Windows Server 2019 STIG Version 3 Release 7**

  V-205691, V-205819, V-205858, V-205859, V-205860, V-205870, V-205871, and V-205923
- **Windows Server 2016 STIG Version 2 Release 10**

  V-224916, V-224917, V-224918, V-224919, V-224931, V-224942, and V-225060
- **Windows Server 2012 R2 MS STIG Version 3 Release 5**

  V-225250, V-225318, V-225319, V-225324, V-225327, V-225328, V-225330, V-225331, V-225332, V-225333, V-225334, V-225335, V-225336, V-225342, V-225343, V-225355, V-225357, V-225358, V-225359, V-225360, V-225362, V-225363, V-225376, V-225392, V-225394, V-225412, V-225459, V-225460, V-225462, V-225468, V-225473, V-225476, V-225479, V-225480, V-225481, V-225482, V-225483, V-225484, V-225485, V-225487, V-225488, V-225489, V-225490, V-225511, V-225514, V-225525, V-225526, V-225536, and V-225537
- **Microsoft .NET Framework 4.0 STIG Version 2 Release 7**

  No STIG settings apply to the Microsoft .NET Framework for Category III vulnerabilities.
- **Windows Firewall STIG Version 2 Release 2**

  V-241994, V-241995, V-241996, V-241999, V-242000, V-242001, V-242006, V-242007, and V-242008
- **Internet Explorer 11 STIG Version 2 Release 6**

  V-223056 and V-223078
- **Microsoft Edge STIG Version 2 Release 4 (Windows Server 2022 and 2025 only)**

V-235727, V-235731, V-235751, V-235752, and V-235765

Windows STIG Medium (Category II)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers. Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list of Windows STIGs, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

> **Note**
>
> The Windows STIG Medium category includes all of the listed STIG hardening settings that apply to Windows STIG low (Category III), in addition to the STIG hardening settings that Amazon EC2 supports for Category II vulnerabilities.

- **Windows Server 2025 STIG Version 1 Release 1**

  Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

  V-278015, V-278016, V-278019, V-278020, V-278021, V-278022, V-278023, V-278024, V-278025, V-278026, V-278033, V-278034, V-278035, V-278036, V-278037, V-278038, V-278039, V-278047, V-278048, V-278049, V-278050, V-278051, V-278052, V-278053, V-278054, V-278055, V-278056, V-278057, V-278058, V-278059, V-278060, V-278061, V-278062, V-278063, V-278064, V-278065, V-278066, V-278067, V-278068, V-278069, V-278070, V-278071, V-278072, V-278073, V-278074, V-278075, V-278076, V-278077, V-278078, V-278079, V-278080, V-278086, V-278088, V-278089, V-278091, V-278092, V-278093, V-278094, V-278095, V-278096, V-278097, V-278102, V-278103, V-278105, V-278106, V-278107, V-278108, V-278109, V-278111, V-278112, V-278113, V-278114, V-278115, V-278116, V-278117, V-278118, V-278119, V-278120, V-278122, V-278123, V-278124, V-278126, V-278127, V-278129, V-278130, V-278131, V-278165, V-278168, V-278169, V-278170, V-278171, V-278174, V-278180, V-278181, V-278182, V-278183, V-278184, V-278185, V-278187, V-278188, V-278189, V-278192, V-278193, V-278194,

- **Microsoft .NET Framework 4.0 STIG Version 2 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

  V-225223, V-225230, V-225235, and V-225238

- **Windows Firewall STIG Version 2 Release 2**

  Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

  V-241989, V-241990, V-241991, V-241993, V-241998, V-242003, V-242004, and V-242005

- **Internet Explorer 11 STIG Version 2 Release 6**

  Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

  V-223015, V-223017, V-223018, V-223019, V-223020, V-223021, V-223022, V-223023, V-223024, V-223025, V-223026, V-223027, V-223028, V-223029, V-223030, V-223031, V-223032, V-223033, V-223034, V-223035, V-223036, V-223037, V-223038, V-223039, V-223040, V-223041, V-223042, V-223043, V-223044, V-223045, V-223046, V-223048, V-223049, V-223050, V-223051, V-223052, V-223053, V-223054, V-223055, V-223057, V-223058, V-223059, V-223060, V-223061, V-223062, V-223063, V-223064, V-223065, V-223066, V-223067, V-223068, V-223069, V-223070, V-223071, V-223072, V-223073, V-223074, V-223075, V-223076, V-223077, V-223079, V-223080, V-223081, V-223082, V-223083, V-223084, V-223085, V-223086, V-223087, V-223088, V-223089, V-223090, V-223091, V-223092, V-223093, V-223094, V-223095, V-223096, V-223097, V-223098, V-223099, V-223100, V-223101, V-223102, V-223103, V-223104, V-223105, V-223106, V-223107, V-223108, V-223109, V-223110, V-223111, V-223112, V-223113, V-223114, V-223115, V-223116, V-223117, V-223118, V-223119, V-223120, V-223121, V-223123, V-223125, V-223126, V-223127, V-223128, V-223129, V-223130, V-223131, V-223132, V-223133, V-223134, V-223135, V-223136, V-223137, V-223138, V-223139, V-223140,

V-223141, V-223142, V-223143, V-223144, V-223145, V-223146, V-223147, V-223148, V-223149, V-250540, and V-250541

- **Microsoft Edge STIG Version 2 Release 4 (Windows Server 2022 and 2025 only)**

  V-235720, V-235721, V-235723, V-235724, V-235725, V-235726, V-235728, V-235729, V-235730, V-235732, V-235733, V-235734, V-235735, V-235736, V-235737, V-235738, V-235739, V-235740, V-235741, V-235742, V-235743, V-235744, V-235745, V-235746, V-235747, V-235748, V-235749, V-235750, V-235754, V-235756, V-235760, V-235761, V-235763, V-235764, V-235766, V-235767, V-235768, V-235769, V-235770, V-235771, V-235772, V-235773, V-235774, and V-246736

- **Microsoft Defender STIG Version 2 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Category III (Low) vulnerabilities, plus:

  V-213427, V-213429, V-213430, V-213431, V-213432, V-213433, V-213434, V-213435, V-213436, V-213437, V-213438, V-213439, V-213440, V-213441, V-213442, V-213443, V-213444, V-213445, V-213446, V-213447, V-213448, V-213449, V-213450, V-213451, V-213454, V-213455, V-213456, V-213457, V-213458, V-213459, V-213460, V-213461, V-213462, V-213463, V-213464, V-213465, V-213466, V-278647, V-278648, V-278649, V-278650, V-278651, V-278652, V-278653, V-278654, V-278655, V-278656, V-278658, V-278659, V-278660, V-278661, V-278662, V-278668, V-278669, V-278672, V-278674, V-278675, V-278676, V-278677, V-278678, V-278679, V-278680, and V-278863

Windows STIG High (Category I)

The following list contains STIG settings that Amazon EC2 supports to your infrastructure. If a supported setting isn't applicable for your infrastructure, Amazon EC2 skips that setting, and moves on. For example, some STIG hardening settings might not apply to standalone servers. Organization-specific policies can also affect which settings apply, such as a requirement for administrators to review document settings.

For a complete list of Windows STIGs, see the STIGs Document Library. For information about how to view the complete list, see STIG Viewing Tools.

> **Note**
>
> The Windows STIG High category includes all of the listed STIG hardening settings that apply for Windows STIG Medium and Low categories, in addition to the STIG hardening settings that Amazon EC2 supports for Category I vulnerabilities.

- **Windows Server 2025 STIG Version 1 Release 1**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-278040, V-278099, V-278100, V-278101, V-278121, V-278125, V-278128, V-278196, V-278215, V-278216, V-278217, V-278219, V-278225, V-278242, V-278246, and V-278250

- **Windows Server 2022 STIG Version 2 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-254250, V-254293, V-254352, V-254353, V-254354, V-254374, V-254378, V-254381, V-254446, V-254466, V-254467, V-254469, V-254474, V-254475, V-254492, V-254496, and V-254500

- **Windows Server 2019 STIG Version 3 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-205653, V-205654, V-205663, V-205711, V-205713, V-205724, V-205725, V-205750, V-205753, V-205757, V-205802, V-205804, V-205805, V-205806, V-205849, V-205908, V-205914, and V-205919

- **Windows Server 2016 STIG Version 2 Release 10**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-224831, V-224874, V-224932, V-224933, V-224934, V-224954, V-224958, V-224961, V-225025, V-225045, V-225046, V-225048, V-225053, V-225054, V-225071, V-225079, and V-225091

- **Windows Server 2012 R2 MS STIG Version 3 Release 5**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-225274, V-225354, V-225364, V-225365, V-225366, V-225390, V-225396, V-225399, V-225444, V-225449, V-225491, V-225492, V-225493, V-225496, V-225497, V-225498, V-225505, V-225507, V-225547, V-225552, and V-225556

- **Microsoft .NET Framework 4.0 STIG Version 2 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities for the Microsoft .NET Framework. No additional STIG settings apply for Category I vulnerabilities.

- **Windows Firewall STIG Version 2 Release 2**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-241992, V-241997, and V-242002

- **Internet Explorer 11 STIG Version 2 Release 6**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-252910

- **Microsoft Edge STIG Version 2 Release 4 (Windows Server 2022 and 2025 only)**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-235758 and V-235759

- **Microsoft Defender STIG Version 2 Release 7**

  Includes all STIG hardening settings that Amazon EC2 supports for Categories II and III (Medium and Low) vulnerabilities, plus:

  V-213426, V-213428, V-213452, and V-213453

STIG hardening script downloads

Amazon groups STIG hardening scripts together into operating system related bundles for each release. Bundles are archive files that are appropriate for the target operating system where they download and run. Linux script bundles are stored as TAR files (.tgz file extension). Windows script bundles are stored as ZIP files (.zip file extension).

Amazon stores the script bundles in the EC2 Windows S3 `STIG` bucket in each AWS Region. The Linux bundles do not have a separate bucket. Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.

Topics

- STIG download bundle details
- Linux STIG version history
- Windows STIG version history

STIG download bundle details

> **Important**
>
> With few exceptions, the STIG hardening scripts that the Systems Manager document downloads do not install third-party packages. If third-party packages are already installed on the instance or the `InstallPackage` parameter is set to `yes`, related STIGs that Amazon EC2 supports for that package are applied.

When you run the following command from the AWS CLI, Amazon S3 downloads the latest STIG hardening script bundle file from the bucket.

```
aws s3 cp s3://aws-windows-downloads-region/STIG/operating system/Latest/bundle-name destination-directory
```

Example: Download to a temporary directory

This example shows a Linux bundle that's downloaded to the `/tmp` directory

```
aws s3 cp s3://aws-windows-downloads-us-east-1/STIG/Linux/
Latest/LinuxAWSConfigureSTIG.tgz /tmp
```

Patterns and examples for download file storage paths and bundle file names are as follows:

Download file storage path

`s3://aws-windows-downloads-<region>/STIG/<operating system>/Latest/<bundle file name>`

Download path variables

region

AWS Region (Each Region has its own download bucket.)

operating system

The operating system platform of the instance where STIGs are applied – either `Linux` or `Windows`.

bundle file name

The format is *<os bundle name>*.*<file extension>*.

os bundle name

The standard name prefix for the operating system bundle is either `LinuxAWSConfigureSTIG` or `AWSConfigureSTIG`. To maintain backwards compatibility, the download for Windows doesn't include a platform prefix.

file extension

Compressed file format `tgz` (Linux) or `zip` (Windows).

Example bundle file names

- `LinuxAWSConfigureSTIG.tgz`
- `AWSConfigureSTIG.zip`

Linux STIG version history

This section logs version history for Linux script bundles that are updated quarterly. To see the changes and published versions for a quarter, choose the title to expand the information. If there are no changes for the quarter, you'll see that reflected in the title.

2026 Q1 changes - 04/07/2026:

Added support for the RHEL 10 operating system and updated the following STIG versions and applied STIGS for the 2026 first quarter release for all compliance levels (low/medium/high):

STIG-Build-Linux version 1.0.x

- RHEL 8 STIG Version 2 Release 6
- RHEL 9 STIG Version 2 Release 7
- RHEL 10 STIG Version 1 Release 1
- Amazon Linux 2023 STIG Version 1 Release 2
- SLES 12 STIG Version 3 Release 4
- SLES 15 STIG Version 2 Release 6
- Ubuntu 20.04 STIG Version 2 Release 4
- Ubuntu 22.04 STIG Version 2 Release 7
- Ubuntu 24.04 STIG Version 1 Release 4

2025 Q3 changes - 09/04/2025:

Added support for the SUSE Linux Enterprise Server (SLES) operating system and Amazon Linux 2023. Updated the following STIG versions and applied STIGS for the 2025 third quarter release for all compliance levels (low/medium/high):

STIG-Build-Linux version 1.0.x

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 4
- RHEL 9 STIG Version 2 Release 5
- Amazon Linux 2023 STIG Version 1 Release 1
- SLES 12 STIG Version 3 Release 3
- SLES 15 STIG Version 2 Release 5
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 3
- Ubuntu 22.04 STIG Version 2 Release 5

- Ubuntu 24.04 STIG Version 1 Release 2

2025 Q2 changes - 06/26/2025:

Updated the following STIG versions, applied STIGS for the 2025 second quarter release:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 3
- RHEL 9 STIG Version 2 Release 4
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2
- Ubuntu 22.04 STIG Version 2 Release 4
- Ubuntu 24.04 STIG Version 1 Release 1

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 3
- RHEL 9 STIG Version 2 Release 4
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2
- Ubuntu 22.04 STIG Version 2 Release 4
- Ubuntu 24.04 STIG Version 1 Release 1

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 3
- RHEL 9 STIG Version 2 Release 4
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2
- Ubuntu 22.04 STIG Version 2 Release 4

- Ubuntu 24.04 STIG Version 1 Release 1

2025 Q1 changes - 04/11/2025:

Updated the following STIG versions, applied STIGS for the 2025 first quarter release, and added support for Ubuntu 24.04:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 2
- RHEL 9 STIG Version 2 Release 3
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2
- Ubuntu 22.04 STIG Version 2 Release 3
- Ubuntu 24.04 STIG Version 1 Release 1

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 2
- RHEL 9 STIG Version 2 Release 3
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2
- Ubuntu 22.04 STIG Version 2 Release 3
- Ubuntu 24.04 STIG Version 1 Release 1

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 2
- RHEL 9 STIG Version 2 Release 3
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 2

- Ubuntu 22.04 STIG Version 2 Release 3
- Ubuntu 24.04 STIG Version 1 Release 1

2024 Q4 changes - 12/10/2024:

Updated the following STIG versions, applied STIGS for the 2024 fourth quarter release, and added information about two new input parameters for the Linux components:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 1
- RHEL 9 STIG Version 2 Release 2
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 1
- Ubuntu 22.04 STIG Version 2 Release 2

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 1
- RHEL 9 STIG Version 2 Release 2
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 1
- Ubuntu 22.04 STIG Version 2 Release 2

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 15
- RHEL 8 STIG Version 2 Release 1
- RHEL 9 STIG Version 2 Release 2
- Ubuntu 18.04 STIG Version 2 Release 15
- Ubuntu 20.04 STIG Version 2 Release 1
- Ubuntu 22.04 STIG Version 2 Release 2

2024 Q3 changes - 10/04/2024 (no changes):

There were no changes for Linux component STIGS for the 2024 third quarter release.

2024 Q2 changes - 05/10/2024:

Updated STIG versions and applied STIGS for the 2024 second quarter release. Also added support for RHEL 9, CentOS Stream 9, and Ubuntu 22.04, as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 14
- RHEL 9 STIG Version 1 Release 3
- Ubuntu 18.04 STIG Version 2 Release 14
- Ubuntu 20.04 STIG Version 1 Release 12
- Ubuntu 22.04 STIG Version 1 Release 1

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 14
- RHEL 9 STIG Version 1 Release 3
- Ubuntu 18.04 STIG Version 2 Release 14
- Ubuntu 20.04 STIG Version 1 Release 12
- Ubuntu 22.04 STIG Version 1 Release 1

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 14
- RHEL 9 STIG Version 1 Release 3
- Ubuntu 18.04 STIG Version 2 Release 14
- Ubuntu 20.04 STIG Version 1 Release 12
- Ubuntu 22.04 STIG Version 1 Release 1

2024 Q1 changes - 02/06/2024:

Updated STIG versions and applied STIGS for the 2024 first quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 13
- Ubuntu 18.04 STIG Version 2 Release 13
- Ubuntu 20.04 STIG Version 1 Release 11

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 13
- Ubuntu 18.04 STIG Version 2 Release 13
- Ubuntu 20.04 STIG Version 1 Release 11

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 14
- RHEL 8 STIG Version 1 Release 13
- Ubuntu 18.04 STIG Version 2 Release 13
- Ubuntu 20.04 STIG Version 1 Release 11

2023 Q4 changes - 12/07/2023:

Updated STIG versions and applied STIGS for the 2023 fourth quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 13
- RHEL 8 STIG Version 1 Release 12
- Ubuntu 18.04 STIG Version 2 Release 12
- Ubuntu 20.04 STIG Version 1 Release 10

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 13
- RHEL 8 STIG Version 1 Release 12
- Ubuntu 18.04 STIG Version 2 Release 12
- Ubuntu 20.04 STIG Version 1 Release 10

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 13
- RHEL 8 STIG Version 1 Release 12
- Ubuntu 18.04 STIG Version 2 Release 12
- Ubuntu 20.04 STIG Version 1 Release 10

2023 Q3 changes - 10/04/2023:

Updated STIG versions and applied STIGS for the 2023 third quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 12
- RHEL 8 STIG Version 1 Release 11
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 9

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 12
- RHEL 8 STIG Version 1 Release 11
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 9

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 12

- RHEL 8 STIG Version 1 Release 11
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 9

2023 Q2 changes - 05/03/2023:

Updated STIG versions and applied STIGS for the 2023 second quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 11
- RHEL 8 STIG Version 1 Release 10
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 8

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 11
- RHEL 8 STIG Version 1 Release 10
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 8

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 11
- RHEL 8 STIG Version 1 Release 10
- Ubuntu 18.04 STIG Version 2 Release 11
- Ubuntu 20.04 STIG Version 1 Release 8

2023 Q1 changes - 03/27/2023:

Updated STIG versions and applied STIGS for the 2023 first quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 10

- RHEL 8 STIG Version 1 Release 9
- Ubuntu 18.04 STIG Version 2 Release 10
- Ubuntu 20.04 STIG Version 1 Release 7

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 10
- RHEL 8 STIG Version 1 Release 9
- Ubuntu 18.04 STIG Version 2 Release 10
- Ubuntu 20.04 STIG Version 1 Release 7

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 10
- RHEL 8 STIG Version 1 Release 9
- Ubuntu 18.04 STIG Version 2 Release 10
- Ubuntu 20.04 STIG Version 1 Release 7

2022 Q4 changes - 02/01/2023:

Updated STIG versions and applied STIGS for the 2022 fourth quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 9
- RHEL 8 STIG Version 1 Release 8
- Ubuntu 18.04 STIG Version 2 Release 9
- Ubuntu 20.04 STIG Version 1 Release 6

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 9
- RHEL 8 STIG Version 1 Release 8
- Ubuntu 18.04 STIG Version 2 Release 9
- Ubuntu 20.04 STIG Version 1 Release 6

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 9
- RHEL 8 STIG Version 1 Release 8
- Ubuntu 18.04 STIG Version 2 Release 9
- Ubuntu 20.04 STIG Version 1 Release 6

2022 Q3 changes - 09/30/2022 (no changes):

There were no changes for Linux component STIGS for the 2022 third quarter release.

2022 Q2 changes - 08/02/2022:

Introduced Ubuntu support, updated STIG versions and applied STIGS for the 2022 second quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 7
- RHEL 8 STIG Version 1 Release 6
- Ubuntu 18.04 STIG Version 2 Release 6 (new)
- Ubuntu 20.04 STIG Version 1 Release 4 (new)

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 7
- RHEL 8 STIG Version 1 Release 6
- Ubuntu 18.04 STIG Version 2 Release 6 (new)
- Ubuntu 20.04 STIG Version 1 Release 4 (new)

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 7
- RHEL 8 STIG Version 1 Release 6
- Ubuntu 18.04 STIG Version 2 Release 6 (new)
- Ubuntu 20.04 STIG Version 1 Release 4 (new)

2022 Q1 changes - 04/26/2022:

Refactored to include better support for containers. Combined the previous AL2 script with RHEL 7. Updated STIG versions and applied STIGS for the 2022 first quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 6
- RHEL 8 STIG Version 1 Release 5

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 6
- RHEL 8 STIG Version 1 Release 5

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 6
- RHEL 8 STIG Version 1 Release 5

2021 Q4 changes - 12/20/2021:

Updated STIG versions, and applied STIGS for the 2021 fourth quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 5
- RHEL 8 STIG Version 1 Release 4

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 5
- RHEL 8 STIG Version 1 Release 4

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 5

- RHEL 8 STIG Version 1 Release 4

2021 Q3 changes - 09/30/2021:

Updated STIG versions, and applied STIGS for the 2021 third quarter release as follows:

Linux STIG Low (Category III)

- RHEL 7 STIG Version 3 Release 4
- RHEL 8 STIG Version 1 Release 3

Linux STIG Medium (Category II)

- RHEL 7 STIG Version 3 Release 4
- RHEL 8 STIG Version 1 Release 3

Linux STIG High (Category I)

- RHEL 7 STIG Version 3 Release 4
- RHEL 8 STIG Version 1 Release 3

Windows STIG version history

This section logs version history for Windows script bundles that are updated quarterly. To see the changes and published versions for a quarter, choose the title to expand the information. If there are no changes for the quarter, you'll see that reflected in the title.

2026 Q1 changes - 04/07/2026:

Adding support for the Windows Server 2025 operating system and updated the following STIG versions and applied STIGS for the 2026 first quarter release for all compliance levels (low/medium/high):

STIG-Build-Windows version 1.0.x

- Windows Server 2025 STIG Version 1 Release 1
- Windows Server 2022 STIG Version 2 Release 7
- Windows Server 2019 STIG Version 3 Release 7

- Microsoft .NET Framework 4.0 STIG Version 2 Release 7
- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 6
- Microsoft Edge STIG Version 2 Release 4 (Windows Server 2022 and 2025 only)

2025 Q4 changes - 12/10/2025 (no changes):

There were no changes for Windows component STIGS for the 2025 fourth quarter release.

2025 Q3 changes - 9/04/2025 (no changes):

There were no changes for Windows component STIGS for the 2025 third quarter release.

2025 Q2 changes - 06/26/2025:

Updated STIG versions and applied STIGS for the 2025 Q2 release as follows:

Windows STIG Low (Category III)

- Windows Server 2022 STIG Version 2 Release 4
- Windows Server 2019 STIG Version 3 Release 4
- Windows Server 2016 STIG Version 2 Release 10
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 6
- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)

Windows STIG Medium (Category II)

- Windows Server 2022 STIG Version 2 Release 4
- Windows Server 2019 STIG Version 3 Release 4
- Windows Server 2016 STIG Version 2 Release 10
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 6

- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4

Windows STIG High (Category I)

- Windows Server 2022 STIG Version 2 Release 4
- Windows Server 2019 STIG Version 3 Release 4
- Windows Server 2016 STIG Version 2 Release 10
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 6
- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4

2025 Q1 changes - 05/04/2025:

Updated STIGS for Internet Explorer 11 STIG Version 2 Release 5 for all STIG components for the 2025 first quarter release.

2024 Q4 changes - 12/10/2024:

Updated STIG versions and applied STIGS for the 2024 Q4 release as follows:

Windows STIG Low (Category III)

- Windows Server 2022 STIG Version 2 Release 2
- Windows Server 2019 STIG Version 3 Release 2
- Windows Server 2016 STIG Version 2 Release 9
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 2

- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)

Windows STIG Medium (Category II)

- Windows Server 2022 STIG Version 2 Release 2
- Windows Server 2019 STIG Version 3 Release 2
- Windows Server 2016 STIG Version 2 Release 9
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4

Windows STIG High (Category I)

- Windows Server 2022 STIG Version 2 Release 2
- Windows Server 2019 STIG Version 3 Release 2
- Windows Server 2016 STIG Version 2 Release 9
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 2
- Internet Explorer 11 STIG Version 2 Release 5
- Microsoft Edge STIG Version 2 Release 2 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4

2024 Q3 changes - 10/04/2024 (no changes):

There were no changes for Windows component STIGS for the 2024 third quarter release.

2024 Q2 changes - 05/10/2024 (no changes):

There were no changes for Windows component STIGS for the 2024 second quarter release.

2024 Q1 changes - 02/23/2024 (no changes):

There were no changes for Windows component STIGS for the 2024 first quarter release.

2023 Q4 changes - 12/07/2023 (no changes):

There were no changes for Windows component STIGS for the 2023 fourth quarter release.

2023 Q3 changes - 10/04/2023 (no changes):

There were no changes for Windows component STIGS for the 2023 third quarter release.

2023 Q2 changes - 05/03/2023 (no changes):

There were no changes for Windows component STIGS for the 2023 second quarter release.

2023 Q1 changes - 03/27/2023 (no changes):

There were no changes for Windows component STIGS for the 2023 first quarter release.

2022 Q4 changes - 02/01/2023:

Updated STIG versions and applied STIGS for the 2022 Q4 release as follows:

Windows STIG Low (Category III)

- Windows Server 2022 STIG Version 1 Release 1
- Windows Server 2019 STIG Version 2 Release 5
- Windows Server 2016 STIG Version 2 Release 5
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 1
- Internet Explorer 11 STIG Version 2 Release 3
- Microsoft Edge STIG Version 1 Release 6 (Windows Server 2022 only)

Windows STIG Medium (Category II)

- Windows Server 2022 STIG Version 1 Release 1
- Windows Server 2019 STIG Version 2 Release 5
- Windows Server 2016 STIG Version 2 Release 5

- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 1
- Internet Explorer 11 STIG Version 2 Release 3
- Microsoft Edge STIG Version 1 Release 6 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4 (Windows Server 2022 only)

Windows STIG High (Category I)

- Windows Server 2022 STIG Version 1 Release 1
- Windows Server 2019 STIG Version 2 Release 5
- Windows Server 2016 STIG Version 2 Release 5
- Windows Server 2012 R2 MS STIG Version 3 Release 5
- Microsoft .NET Framework 4.0 STIG Version 2 Release 2
- Windows Firewall STIG Version 2 Release 1
- Internet Explorer 11 STIG Version 2 Release 3
- Microsoft Edge STIG Version 1 Release 6 (Windows Server 2022 only)
- Defender STIG Version 2 Release 4 (Windows Server 2022 only)

2022 Q3 changes - 09/30/2022 (no changes):

There were no changes for Windows component STIGS for the 2022 third quarter release.

2022 Q2 changes - 08/02/2022:

Updated STIG versions and applied STIGS for the 2022 Q2 release.

Windows STIG Low (Category III)

- Windows Server 2019 STIG Version 2 Release 4
- Windows Server 2016 STIG Version 2 Release 4
- Windows Server 2012 R2 MS STIG Version 3 Release 3
- Microsoft .NET Framework 4.0 STIG Version 2 Release 1
- Windows Firewall STIG Version 2 Release 1
- Internet Explorer 11 STIG Version 1 Release 19

Use AWS Systems Manager to apply STIG settings to your instance

You can use the `AWSEC2-ConfigureSTIG` Systems Manager command document to apply STIG settings to an existing EC2 instance. You must run the command document from the instance that it updates. The command document applies appropriate settings based on the operating system and configuration of the instance where it runs.

This page contains details about the `AWSEC2-ConfigureSTIG` command document, including input parameters and how to run it in the Systems Manager console or with `send-command` in the AWS CLI.

AWSEC2-ConfigureSTIG input parameters

You can provide the following input parameters to specify how the command document should apply STIG settings to your instance.

Level (string, required)

Specify the STIG severity category to apply. Valid values include the following:

- High

- Medium
- Low

If you don't specify a value the system defaults to `High`.

InstallPackages (string, optional – Linux only)

If the value is `No`, the script does not install any additional software packages. If the value is `Yes`, the script installs additional software packages that are required for maximum compliance. The default value is `No`.

SetDoDConsentBanner (string, optional – Linux only)

If the value is `No`, the DoD consent banner is not shown when you attach to an instance that has a Linux STIG script installed. If the value is `Yes`, the DoD consent banner is shown before you log in when you attach to an instance that has one of the STIG Linux scripts installed. You must acknowledge the banner before you can log in. The default value is `No`.

For an example of the consent banner, see the Disclaimer Department of Defense Privacy and Consent Notice that appears when you access the DLA Document Services website.

Run the AWSEC2-ConfigureSTIG command document

To run the `AWSEC2-ConfigureSTIG` document, follow the steps for your preferred environment.

Console

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. Select **Run Command** from the navigation pane. This shows a list of commands that are currently running in your account, if applicable.
3. Choose **Run command**. This opens the **Run a command** dialog and displays a list of command documents that you have access to.
4. Select `AWSEC2-ConfigureSTIG` from the list of command documents. To streamline results, you can enter all or part of the document name. You can also filter by the owner, by platform types, or by tags.

   When you select a command document, details populate below the list.
5. Select `Default version at runtime` from the **Document version** list.

6. Configure the **Command parameters** to define how `AWSEC2-ConfigureSTIG` will install the script package and run it to update your instance. For parameter details, see AWSEC2-ConfigureSTIG input parameters.
7. For **Target selection**, specify tags or select instances manually to identify the instances on which to run this operation.

   > **Note**
   >
   > If you select instances manually, and an instance you expect to see is not included in the list, see Where Are My Instances? for troubleshooting tips.

8. For additional parameters to define Systems Manager Run Command behavior such as **Rate control**, enter values as described in Running commands from the console.
9. Choose **Run**.

   If successful, the command document installs the script and configures your instance. If the command execution failed, view the Systems Manager command output for details about why the execution failed.

AWS CLI

Example 1: Run with default values

Run the following command to install the STIG script and run it with default values. For more information about input parameters, see AWSEC2-ConfigureSTIG input parameters.

```
aws ssm send-command \
 --document-name "AWSEC2-ConfigureSTIG" \
 --instance-ids "i-1234567890abcdef0"'
```

Example 2: Configure Medium level STIG settings on your instance

Run the following command to install the STIG script and run it with the `Level` input parameter set to `Medium`. For more information about input parameters, see AWSEC2-ConfigureSTIG input parameters.

```
aws ssm send-command \
 --document-name "AWSEC2-ConfigureSTIG" \
 --instance-ids "i-1234567890abcdef0"
```

```
 --parameters '{"Level":"Medium"}'
```

If successful, the command document installs the script and configures your instance. If the command execution failed, view the command output for details about why the execution failed.

PowerShell

Example 1: Run with default values

Run the following command to install the STIG script and run it with default values. For more information about input parameters, see AWSEC2-ConfigureSTIG input parameters.

```
Send-SSMCommand -DocumentName "AWSEC2-ConfigureSTIG" -InstanceId
 "i-1234567890abcdef0"}
```

Example 2: Configure Medium level STIG settings on your instance

Run the following command to install the STIG script and run it with the `Level` input parameter set to `Medium`. For more information about input parameters, see AWSEC2-ConfigureSTIG input parameters.

```
Send-SSMCommand -DocumentName "AWSEC2-ConfigureSTIG" -InstanceId
 "i-1234567890abcdef0" -Parameter @{'Level'='Medium'}
```

If successful, the command document installs the script and configures your instance. If the command execution failed, view the command output for details about why the execution failed.

Precision clock and time synchronization on your EC2 instance

A consistent and accurate time reference on your Amazon EC2 instance is crucial for many server tasks and processes. Time stamps in system logs play an essential role in identifying when issues occurred and the chronological order of events. When you use the AWS CLI or an AWS SDK to make requests from your instance, these tools sign requests on your behalf. If your instance's date and time settings are inaccurate, it can result in a discrepancy between the date in the signature and the date of the request, leading to AWS rejecting your requests.

To address this important aspect, Amazon offers the Amazon Time Sync Service, which is accessible from all EC2 instances and used by various AWS services. The service uses a fleet of satellite-

connected and atomic reference clocks in each AWS Region to deliver accurate and current time readings of the Coordinated Universal Time (UTC) global standard.

For the best performance, we recommend using the local Amazon Time Sync Service on your EC2 instances. For a backup to the local Amazon Time Sync Service on your instances, or to connect resources outside of Amazon EC2 to the Amazon Time Sync Service, you can use the public Amazon Time Sync Service located at `time.aws.com`. The public Amazon Time Sync Service, like the local Amazon Time Sync Service, automatically smears any leap seconds that are added to UTC. The public Amazon Time Sync Service is supported globally by our fleet of satellite-connected and atomic reference clocks in each AWS Region.

Hardware packet timestamping

You can enable hardware packet timestamping on your instance to add a 64-bit nanosecond-precision timestamp to every incoming network packet. Because hardware packet timestamping occurs at the hardware level—before the packet reaches the kernel, socket, or application layer—you bypass any delays added by software timestamping. The underlying reference clock for hardware timestamping is the Amazon Time Sync Service PTP hardware clock.

Benefits

Hardware packet timestamping provides the following benefits:

- Improves event ordering, which can also be used to determine the actual order in which packets arrive at your EC2 instance, ensuring fair packet processing.
- Measures one-way network latency.
- Increases distributed transaction speed with higher precision and accuracy compared to most on-premises solutions.

Prerequisites and configuration

To enable hardware packet timestamping, your instance must meet the following prerequisites:

- Must be a Linux instance.
- Meet the requirements to support the PTP hardware clock.

For the configuration instructions, see Hardware Packet Timestamping on the **Linux kernel driver for Elastic Network Adapter (ENA) family** page on *GitHub*.

Leap seconds

Leap seconds, introduced in 1972, are occasional one-second adjustments to UTC time to factor in irregularities in the earth's rotation to accommodate differences between International Atomic Time (TAI) and solar time (Ut1). To manage leap seconds on behalf of customers, we designed leap second smearing within the Amazon Time Sync Service. For more information, see Look Before You Leap – The Coming Leap Second and AWS.

Leap seconds are going away, and we are in full support of the decision made at the 27th General Conference on Weights and Measures to abandon leap seconds by or before 2035.

To support this transition, we still plan on smearing time during a leap second event when accessing the Amazon Time Sync Service over the local NTP connection or our public NTP pools (`time.aws.com`). The PTP hardware clock, however, does not provide a smeared time option. In the event of a leap second, the PTP hardware clock will add the leap second following UTC standards. Leap-smeared and leap second time sources are the same in most cases. But because they differ during a leap second event, we do not recommend using both smeared and non-smeared time sources in your time client configuration during a leap second event.

Topics

- Set the time reference on your EC2 instance to use the local Amazon Time Sync Service
- Set the time reference on your EC2 instance or any internet-connected device to use the public Amazon Time Sync Service
- Compare timestamps for your Linux instances
- Change the time zone of your instance

Set the time reference on your EC2 instance to use the local Amazon Time Sync Service

The Amazon Time Sync Service provides several methods for your Amazon EC2 instance to synchronize to a local time source. First, any Amazon EC2 instance can reach a local time source over the Network Time Protocol (NTP). In addition, the enhanced Amazon Time Sync Service offers higher-accuracy local time sources to supported Amazon EC2 instances. Launch your supported instance in a placement group with the `precision-time` strategy to reach a higher-accuracy NTP source. Finally, Linux instances launched in a precision time placement group have access to a PTP Hardware Clock (PHC) device and the ability to retrieve hardware packet timestamps.

Any Amazon EC2 instance has access to the local NTP source. You can reach the NTP source over a link-local IP address, which restricts this traffic to within your VPC without the need for specific VPC configuration changes. Your AMI might already have configured your clock synchronization daemon to use the local NTP source by default. This NTP source is available over the following IP addresses:

- IPv4: `169.254.169.123`
- IPv6: `fd00:ec2::123` (Only accessible on Nitro-based instances.)

Supported Amazon EC2 instances have access to the enhanced Amazon Time Sync Service. To access the enhanced Amazon Time Sync Service, launch a supported instance in a placement group with the `precision-time` strategy. You do not need to configure your instance to benefit from this improvement if you use the NTP link-local IP addresses. Any operating system can use this enhancement. You can verify that you benefit from the enhanced NTP source by using your NTP client of choice.

Linux-based AMIs, running on supported instance families, have the additional option to source time from a PHC device. The ENA driver makes this device available. Both enhanced NTP source and PHC device use the same highly accurate time source. Access to the PHC time source is optimized, leading to a more accurate synchronization of your Amazon EC2 instance.

Considerations

- The NTP time source offers a leap smearing view of the UTC timescale, while the PHC does not smear time. For more information, see Leap seconds.
- Only Linux instances have access to the local PTP hardware clock. Windows instances must use NTP to access the enhanced Amazon Time Sync Service.

- There is a 1024 packet per second (PPS) limit to services that use link-local addresses. This limit includes the aggregate of Route 53 Resolver DNS Queries, Instance Metadata Service (IMDS) requests, Amazon Time Sync Service Network Time Protocol (NTP) requests, and Windows Licensing Service (for Microsoft Windows based instances) requests.

Contents

- Access the IPv4 endpoint of the Amazon Time Sync Service
- Access the IPv6 endpoint of the Amazon Time Sync Service
- Access the enhanced Amazon Time Sync Service
- Access the PTP Hardware Clock (PHC)

Access the IPv4 endpoint of the Amazon Time Sync Service

Your AMI might already have configured the Amazon Time Sync Service by default. Otherwise, use the following procedures to configure your instance to use the local Amazon Time Sync Service through the IPv4 endpoint.

For help troubleshooting issues, see Troubleshoot NTP synchronization issues on Linux instances or Troubleshoot time issues on Windows instances.

Amazon Linux

AL2023 and recent versions of Amazon Linux 2 are configured to use the Amazon Time Sync Service IPv4 endpoint by default. If you confirm that your instance is already configured, you can skip the following procedure.

To verify that chrony is configured to use the IPv4 endpoint

Run the following command. In the output, the line that starts with ^* indicates the preferred time source.

```
[ec2-user ~]$ chronyc sources -v | grep -F ^*
```

```
^* 169.254.169.123               3   4   377    13  -4325ns[-9201ns] +/-  401us
```

To configure chrony to connect to the IPv4 endpoint on older versions of Amazon Linux 2

1. Connect to your instance and uninstall the NTP service.

```
[ec2-user ~]$ sudo yum erase 'ntp*'
```

2. Install the chrony package.

```
[ec2-user ~]$ sudo yum install chrony
```

3. Open the /etc/chrony.conf file using a text editor (such as **vim** or **nano**). Add the following line before any other server or pool statements that may be present in the file, and save your changes:

```
server 169.254.169.123 prefer iburst minpoll 4 maxpoll 4
```

4. Restart the chrony daemon (chronyd).

```
[ec2-user ~]$ sudo service chronyd restart
```

```
Starting chronyd:                                          [  OK  ]
```

> **Note**
>
> On RHEL and CentOS (up to version 6), the service name is chrony instead of chronyd.

5. To configure chronyd to start at each system boot, use the chkconfig command.

```
[ec2-user ~]$ sudo chkconfig chronyd on
```

6. Verify that chrony is using the 169.254.169.123 IPv4 endpoint to synchronize the time.

```
[ec2-user ~]$ chronyc sources -v | grep -F ^*
```

In the output, ^* indicates the preferred time source.

```
^* 169.254.169.123               3   6    17    43    -30us[ -226us] +/-  287us
```

7. Verify the time synchronization metrics that are reported by chrony.

```
[ec2-user ~]$ chronyc tracking
```

```
Reference ID    : A9FEA97B (169.254.169.123)

```

Ubuntu

To configure chrony to connect to the IPv4 endpoint on Ubuntu

1. Connect to your instance and use `apt` to install the `chrony` package.

```
ubuntu:~$ sudo apt install chrony
```

> **Note**
>
> If necessary, update your instance first by running `sudo apt update`.

2. Open the `/etc/chrony/chrony.conf` file using a text editor (such as **vim** or **nano**). Add the following line before any other `server` or `pool` statements that are already present in the file, and save your changes:

```
server 169.254.169.123 prefer iburst minpoll 4 maxpoll 4
```

3. Restart the `chrony` service.

```
ubuntu:~$ sudo /etc/init.d/chrony restart
```

```
Restarting chrony (via systemctl): chrony.service.
```

4. Verify that `chrony` is using the `169.254.169.123` IPv4 endpoint to synchronize the time.

```
ubuntu:~$ chronyc sources -v | grep -F ^*
```

In the output, the line starting with `^*` indicates the preferred time source.

```
^* 169.254.169.123               3   6    17    12    +15us[  +57us] +/-  320us
```

5. Verify the time synchronization metrics that are reported by `chrony`.

```
ubuntu:~$ chronyc tracking
```

```

SUSE Linux

Starting with SUSE Linux Enterprise Server 15, `chrony` is the default implementation of NTP.

To configure chrony to connect to IPv4 endpoint on SUSE Linux

1. Open the `/etc/chrony.conf` file using a text editor (such as **vim** or **nano**).
2. Verify that the file contains the following line:

```
server 169.254.169.123 prefer iburst minpoll 4 maxpoll 4
```

If this line is not present, add it.

3. Comment out any other server or pool lines.
4. Open YaST and enable the chrony service.

Windows

Starting with the August 2018 release, Windows AMIs use the Amazon Time Sync Service by default. No further configuration is required for instances launched from these AMIs and you can skip the following procedures.

If you're using an AMI that doesn't have the Amazon Time Sync Service configured by default, first verify your current NTP configuration. If your instance is already using the IPv4 endpoint of the Amazon Time Sync Service, no further configuration is required. If your instance is not using the Amazon Time Sync Service, then complete the procedure to change the NTP server to use the Amazon Time Sync Service.

To verify the NTP configuration

1. From your instance, open a Command Prompt window.
2. Get the current NTP configuration by typing the following command:

```
w32tm /query /configuration
```

This command returns the current configuration settings for the Windows instance and will show if you're connected to the Amazon Time Sync Service.

3. (Optional) Get the status of the current configuration by typing the following command:

```
w32tm /query /status
```

This command returns information such as the last time the instance synced with the NTP server and the poll interval.

To change the NTP server to use the Amazon Time Sync Service

1. From the Command Prompt window, run the following command:

```
w32tm /config /manualpeerlist:169.254.169.123 /syncfromflags:manual /update
```

2. Verify your new settings by using the following command:

   ```
   w32tm /query /configuration
   ```

   In the output that's returned, verify that `NtpServer` displays the `169.254.169.123` IPv4 endpoint.

Default NTP settings for Amazon Windows AMIs

Amazon Machine Images (AMIs) generally adhere to the out-of-the-box defaults except in cases where changes are required to function on EC2 infrastructure. The following settings have been determined to work well in a virtual environment, as well as to keep any clock drift to within one second of accuracy:

- **Update Interval** – Governs how frequently the time service will adjust system time towards accuracy. AWS configures the update interval to occur once every two minutes.
- **NTP Server** – Starting with the August 2018 release, AMIs use the Amazon Time Sync Service by default. This time service is accessible from any AWS Region at the 169.254.169.123 IPv4 endpoint. Additionally, the 0x9 flag indicates that the time service is acting as a client, and to use `SpecialPollInterval` to determine how frequently to check in with the configured time server.
- **Type** – "NTP" means that the service acts as a standalone NTP client instead of acting as part of a domain.
- **Enabled and InputProvider** – The time service is enabled and provides time to the operating system.
- **Special Poll Interval** – Checks against the configured NTP Server every 900 seconds (15 minutes).

> **Note**
>
> For Windows Server 2025 AMIs, the `SpecialPollInterval` value is 1024 seconds instead of 900 seconds.

Registry path	Key name	Data
HKLM:\System\CurrentControlSet\services\w32time\Config	UpdateInterval	120
HKLM:\System\CurrentControlSet\services\w32time\Parameters	NtpServer	169.254.169.123,0x9
HKLM:\System\CurrentControlSet\services\w32time\Parameters	Type	NTP
HKLM:\System\CurrentControlSet\services\w32time\TimeProviders\NtpClient	Enabled	1
HKLM:\System\CurrentControlSet\services\w32time\TimeProviders\NtpClient	InputProvider	1
HKLM:\System\CurrentControlSet\services\w32time\TimeProviders\NtpClient	SpecialPollInterval	900 (Windows Server 2016, 2019, and 2022) or 1024 (Windows Server 2025)

Access the IPv6 endpoint of the Amazon Time Sync Service

This section explains how the steps described in Access the IPv4 endpoint of the Amazon Time Sync Service differ if you are configuring your instance to use the local Amazon Time Sync Service through the IPv6 endpoint. It doesn't explain the entire Amazon Time Sync Service configuration process.

The IPv6 endpoint is only accessible on Nitro-based instances.

We don't recommend using both the IPv4 and IPv6 endpoint entries together. The IPv4 and IPv6 NTP packets come from the same local server for your instance. Configuring both IPv4 and IPv6 endpoints is unnecessary and will not improve the accuracy of the time on your instance.

Linux

Depending on the Linux distribution you're using, when you reach the step to edit the `chrony.conf` file, you'll be using the IPv6 endpoint of the Amazon Time Sync Service (`fd00:ec2::123`) rather than the IPv4 endpoint (`169.254.169.123`):

```
server fd00:ec2::123 prefer iburst minpoll 4 maxpoll 4
```

Save the file and verify that chrony is using the `fd00:ec2::123` IPv6 endpoint to synchronize time:

```
[ec2-user ~]$ chronyc sources -v
```

In the output, if you see the `fd00:ec2::123` IPv6 endpoint, the configuration is complete.

Windows

When you reach the step to change the NTP server to use the Amazon Time Sync Service, you'll be using the IPv6 endpoint of the Amazon Time Sync Service (`fd00:ec2::123`) rather than the IPv4 endpoint (`169.254.169.123`):

```
w32tm /config /manualpeerlist:fd00:ec2::123 /syncfromflags:manual /update
```

Verify that your new settings are using the `fd00:ec2::123` IPv6 endpoint to synchronize time:

```
w32tm /query /configuration
```

In the output, verify that `NtpServer` displays the `fd00:ec2::123` IPv6 endpoint.

Access the enhanced Amazon Time Sync Service

The enhanced Amazon Time Sync Service offers higher accuracy local time sources to supported Amazon EC2 instances. Instances launched in a placement group with a `precision-time` strategy can access these local sources. We recommend precision time placement groups for applications that require more accurate time from either the link-local NTP source, or a PTP Hardware Clock (PHC) device on a Linux instance. When you launch instances into a precision time placement group, AWS places them on supported hardware with direct access to high-precision time sources in AWS infrastructure.

Key benefits

- **Improved NTP source by default** — Your instance has immediate access to an enhanced local NTP time source, if you use the NTP link-local IP addresses as described in the preceding section.
- **Microsecond-accurate clock synchronization** — Configure your Amazon EC2 Linux instance to use a PTP Hardware Clock device and achieve microsecond-accurate clock synchronization.
- **Simplified deployment** — Single placement strategy ensures all instances have precision time capabilities.
- **Hardware packet timestamping** — Access low-level packet timestamps for network measurements.
- **No additional cost** — Precision time placement groups are available at no extra charge.

Rules and limitations

- Precision time placement groups are available in all AWS Commercial Regions.
- Precision time placement groups support the following Gen7 and later Amazon EC2 instance families:
  - **General purpose**: M7a, M7g, M7gd, M7i, M7i-flex, M8a, M8g
  - **Compute optimized**: C7a, C7gd, C7i, C7i-flex, C8g, C8gd
  - **Memory optimized**: R7a, R7g, R7i, R8g, X8g
  - **Storage optimized**: I8g, I8ge
- If you start or launch an instance in a precision time placement group and there is insufficient hardware to give access to the enhanced Amazon Time Sync Service, the request fails.
- If you stop an instance in a precision time placement group and then start it again, it still runs in the placement group. However, the start might fail if there is insufficient hardware to give access to the enhanced Amazon Time Sync Service.
- Amazon EC2 continuously adds hardware that supports the enhanced Amazon Time Sync Service. If your request fails due to insufficient capacity, try again later or try a different Availability Zone. For more information, see Troubleshoot Amazon EC2 instance launch issues.
- Rules and limitations of placement groups apply. For more information, see Placement groups for your Amazon EC2 instances

Create a precision time placement group

You can create a precision time placement group using the AWS CLI, AWS Management Console, or AWS SDKs, by specifying the `precision-time` strategy.

Using AWS CLI

Run the following command:

```
aws ec2 create-placement-group \
    --group-name my-precision-time-pg \
    --strategy precision-time
```

The command returns a placement group ARN that you use when creating capacity reservations, and a group name or group ID that you use when launching instances and linking placement groups.

Launch an instance

After you create a precision time placement group, specify it when launching instances to access the enhanced Amazon Time Sync Service:

```
aws ec2 run-instances \
    --image-id ami-0abcdef1234567890 \
    --instance-type r7g.2xlarge \
    --placement GroupId=pg-0aaa1111111111111
```

Verify access to the enhanced Amazon Time Sync Service

After you launch your instance in a precision time placement group, you benefit from an enhanced NTP time source.

For example, if you use the chronyd daemon on your instance, you can verify that the NTP time source is now referred to as a Stratum 1 and has improved clock accuracy metrics:

```
[ec2-user ~]$ chronyc sources
```

```
MS Name/IP address         Stratum Poll Reach LastRx Last sample
===============================================================================
```

```
^* 169.254.169.123               1   4   377     3  +3477ns[+4689ns] +/-   91us
```

Verify the time synchronization metrics that are reported by `chrony`.

```
[ec2-user ~]$ chronyc tracking
```

```

Access the PTP Hardware Clock (PHC)

The PTP Hardware Clock (PHC) is part of the AWS Nitro System. It is directly accessible on supported bare metal and virtualized Amazon EC2 instances launched in a precision time placement group. The PHC device is currently accessible on Linux instances only. The following sections describe how to set up and verify the PHC device on your Linux instance.

Requirements

- ENA driver version 2.10.0 or later installed on a supported operating system.
- An Amazon EC2 instance running Linux. For more information about supported operating systems, see the driver prerequisites on *GitHub*.
- An Amazon EC2 instance launched in a precision time placement group (see Access the enhanced Amazon Time Sync Service).

> **Note**
>
> The enhanced Amazon Time Sync Service and the PHC device remain accessible without a precision time placement group in the following regions and for the specific instance

families. For the best experience, we recommend launching Amazon EC2 instances in precision placement groups instead.

- Legacy access supported AWS Regions: US East (N. Virginia), US East (Ohio), Asia Pacific (Malaysia), Asia Pacific (Thailand), Asia Pacific (Tokyo), and Europe (Stockholm)
- Legacy access supported Local Zones: US East (New York City)
- Legacy access supported instance families:
  - **General purpose:** M7a, M7g, M7i
  - **Memory optimized:** R7a, R7g, R7i
  - **Storage optimized:** I8g, I8ge

Compile and enable the ENA driver with PHC support

Always review the most recent instructions from the latest Elastic Network Adapter (ENA) driver version in the ENA driver documentation on *GitHub* for information specific to your operating system. The following is an overview of steps for Amazon Linux.

Before you begin, ensure your instance meets the Requirements.

To compile and enable the ENA driver with PHC support

1. Install prerequisites.

```
[ec2-user ~]$ sudo yum update
[ec2-user ~]$ sudo yum install kernel-devel-$(uname -r) git
[ec2-user ~]$ sudo reboot
```

2. Load the required ptp module.

```
[ec2-user ~]$ sudo modprobe ptp
```

3. Retrieve the latest ENA driver version (version 2.10.0 or later).

```
[ec2-user ~]$ git clone https://github.com/amzn/amzn-drivers.git /tmp/amzn-drivers
```

4. Build the ENA driver `ena.ko` with PHC support.

```
[ec2-user ~]$ cd /tmp/amzn-drivers/kernel/linux/ena
```

```
[ec2-user ~]$ ENA_PHC_INCLUDE=1 make
```

5. Reload the ENA driver and enable the PHC device.

```
[ec2-user ~]$ sudo rmmod ena && sudo insmod ena.ko phc_enable=1
```

6. Validate the loaded ENA driver has PHC support.

```
[ec2-user ~]$ modinfo ena | grep -E "phc_enable"
```

```
parm:           phc_enable:Enable PHC.
```

7. Validate the PHC support is enabled with the ENA driver.

```
[ec2-user ~]$ cat /sys/module/ena/parameters/phc_enable
```

```
1
```

For instructions to install the driver and activate the phc_enable option upon reboot, see the ENA driver README on *GitHub*.

Verify the PTP device configuration

Verify that the ENA PTP hardware clock device shows up on your instance.

```
[ec2-user ~]$ for file in /sys/class/ptp/*; do echo -n "$file: "; cat "$file/
clock_name"; done
```

Expected output

```
/sys/class/ptp/ptp<index>: ena-ptp-<PCI slot>
```

Where:

- *index* is the kernel-registered PTP hardware clock index.
- *PCI slot* is the ENA ethernet controller PCI slot. This is the same slot as shown in `lspci | grep ENA`.

Example output

```
/sys/class/ptp/ptp0: ena-ptp-05
```

If ena-ptp-*<PCI slot>* is not in the output, the ENA driver was not correctly installed. Review the steps in Compile and enable the ENA driver with PHC support.

Configure PTP symlink

PTP devices are typically named /dev/ptp0, /dev/ptp1, and so on, with their index depending on the hardware initialization order. Creating a symlink ensures that applications like chrony consistently reference the correct device, regardless of index changes.

The latest Amazon Linux 2023 AMIs include a udev rule that creates the /dev/ptp_ena symlink, pointing to the correct /dev/ptp entry associated with the ENA host.

First, check if the symlink is present by running the following command.

```
[ec2-user ~]$ ls -l /dev/ptp*
```

Example output

```
crw------- 1 root root 245, 0 Jan 31 2025 /dev/ptp0
lrwxrwxrwx 1 root root      4 Jan 31 2025 /dev/ptp_ena -> ptp0
```

Where:

- /dev/ptp*<index>* is the path to the PTP device.
- /dev/ptp_ena is the constant symlink, which points to the same PTP device.

If the /dev/ptp_ena symlink is present, skip to Configure the chronyd daemon to use the PHC device. If it's missing, do the following:

To create the PTP symlink

1. Add the following udev rule.

```
[ec2-user ~]$ echo "SUBSYSTEM==\"ptp\", ATTR{clock_name}==\"ena-ptp-*\", SYMLINK +=
 \"ptp_ena\"" | sudo tee -a /etc/udev/rules.d/53-ec2-network-interfaces.rules
```

2. Reload the udev rule, either by rebooting the instance, or by running the following command.

```
[ec2-user ~]$ sudo udevadm control --reload-rules && sudo udevadm trigger
```

Configure the chronyd daemon to use the PHC device

The chronyd clock synchronization daemon must be configured to use the PHC device as an additional time source, using the /dev/ptp_ena symlink to identify the device.

To configure the chronyd daemon to use the PHC device

1. Edit /etc/chrony.conf using a text editor and add the following line:

```
refclock PHC /dev/ptp_ena poll 0 delay 0.000010 prefer
```

2. Restart chrony.

```
[ec2-user ~]$ sudo systemctl restart chronyd
```

3. Verify that chrony is using the PTP hardware clock. The PHC0 device must be the preferred time source with a Stratum 0 value. The local NTP time source (if configured) must have a Stratum 1 value.

```
[ec2-user ~]$ chronyc sources
```

```
MS Name/IP address         Stratum Poll Reach LastRx Last sample
===============================================================================
#* PHC0                          0   0   377     0   +184ns[ +198ns] +/- 5032ns
^- 169.254.169.123               1   4   377     8    -18us[  -18us] +/-  115us
```

Verify hardware packet timestamping

The ENA driver loaded with the PHC support provides access to hardware packet timestamping. You can verify support for this functionality by using the `ethtool -T` *interface* command.

For more information about using hardware packet timestamping, see the packet timestamping Linux documentation.

```
[ec2-user ~]$ sudo ethtool -T ens5
```

```
Time stamping parameters for ens5:
Capabilities:
        software-transmit
        hardware-receive
        software-receive
        software-system-clock
PTP Hardware Clock: 0
Hardware Transmit Timestamp Modes: none
Hardware Receive Filter Modes:
        none
        all
```

If the output shows `hardware-receive` in the Capabilities list, hardware packet timestamping is available on your instance.

Set the time reference on your EC2 instance or any internet-connected device to use the public Amazon Time Sync Service

You can set your instance, or any internet-connected device such as your local computer or an on-prem server, to use the public Amazon Time Sync Service, which is accessible over the internet at `time.aws.com`. You can use the public Amazon Time Sync Service as a backup for the local Amazon Time Sync Service and to connect resources outside of AWS to the Amazon Time Sync Service.

> **Note**
>
> For the best performance, we recommend using the *local* Amazon Time Sync Service on your instances, and only using the *public* Amazon Time Sync Service as a backup.

Use the instructions for the operating system of your instance or device.

Linux

To set your Linux instance or device to use the public Amazon Time Sync Service using chrony or ntpd

1. Edit `/etc/chrony.conf` (if you use chrony) or `/etc/ntp.conf` (if you use ntpd) using a text editor as follows:

   a. To prevent your instance or device from trying to mix smeared and non-smeared servers, remove or comment out lines starting with `server` except any existing connection to the local Amazon Time Sync Service.

   > **Important**
   >
   > If you're setting your EC2 instance to connect to the public Amazon Time Sync Service, do not remove the following line which sets your instance to connect to the local Amazon Time Sync Service. The local Amazon Time Sync Service is a more direct connection and will provide better clock accuracy. The public Amazon Time Sync Service should only be used as a backup.
   >
   > ```
   > server 169.254.169.123 prefer iburst minpoll 4 maxpoll 4
   > ```

   b. Add the following line to connect to the public Amazon Time Sync Service.

   ```
   pool time.aws.com iburst
   ```

2. Restart the daemon using one of the following commands.

   - chrony

     ```
     sudo service chronyd force-reload
     ```

   - ntpd

     ```
     sudo service ntp reload
     ```

macOS

To set your macOS instance or device to use the public Amazon Time Sync Service

1. Open **System Preferences**.
2. Choose **Date & Time**, and then choose the **Date & Time** tab.
3. To make changes, choose the lock icon, and enter your password when prompted.
4. For **Set date and time automatically**, enter **`time.aws.com`**.

Windows

To set your Windows instance or device to use the public Amazon Time Sync Service

1. Open the **Control Panel**.
2. Choose the **Date and Time** icon.
3. Choose the **Internet Time** tab. This tab is not be available if your PC is part of a domain. In this case, it will synchronize time with the domain controller. You can configure the controller to use the public Amazon Time Sync Service.
4. Choose **Change settings**.
5. Select the checkbox for **Synchronize with an Internet time server**.
6. Next to **Server**, enter **`time.aws.com`**.

To set your Windows Server instance or device to use the public Amazon Time Sync Service

- Follow Microsoft's instructions to update your registry.

Compare timestamps for your Linux instances

If you're using the Amazon Time Sync Service, you can compare the timestamps on your Amazon EC2 Linux instances with ClockBound to determine the true time of an event. ClockBound measures the clock accuracy of your EC2 instance, and allows you to check if a given timestamp is in the past or future with respect to your instance's current clock. This information is valuable for determining the order and consistency of events and transactions across EC2 instances, independent of each instance's geographic location.

ClockBound is an open source daemon and library. To learn more about ClockBound, including installation instructions, see ClockBound on *GitHub*.

ClockBound is only supported for Linux instances.

If you're using the direct PTP connection to the PTP hardware clock, your time daemon, such as chrony, will underestimate the clock error bound. This is because a PTP hardware clock does not pass the correct error bound information to chrony, the way that NTP does. As a result, your clock synchronization daemon assumes the clock is accurate to UTC and thus has an error bound of `0`. To measure the full error bound, the Nitro System calculates the error bound of the PTP hardware clock, and makes it available to your EC2 instance over the ENA driver `sysfs` filesystem. You can read this directly as a value, in nanoseconds.

To retrieve the PTP hardware clock error bound

1. First get the correct location of the PTP hardware clock device by using one of the following commands. The path in the command is different depending on the AMI used to launch the instance.

   - For Amazon Linux 2:

     ```
     cat /sys/class/net/eth0/device/uevent | grep PCI_SLOT_NAME
     ```

   - For Amazon Linux 2023:

     ```
     cat /sys/class/net/ens5/device/uevent | grep PCI_SLOT_NAME
     ```

   The output is the PCI slot name, which is the location of the PTP hardware clock device. In this example, the location is `0000:00:03.0`.

   ```
   PCI_SLOT_NAME=0000:00:03.0
   ```

2. To retrieve the PTP hardware clock error bound, run the following command. Include the PCI slot name from the previous step.

   ```
   cat /sys/bus/pci/devices/0000:00:03.0/phc_error_bound
   ```

   The output is the clock error bound of the PTP hardware clock, in nanoseconds.

To calculate the correct clock error bound at a specific point in time when using the direct PTP connection to the PTP hardware clock, you must add the clock error bound from chrony or ClockBound at the time that chrony polls the PTP hardware clock. For more information about measuring and monitoring clock accuracy, see Manage Amazon EC2 instance clock accuracy using Amazon Time Sync Service and Amazon CloudWatch – Part 1.

Change the time zone of your instance

Amazon EC2 instances are set to the UTC (Coordinated Universal Time) time zone by default. You can change the time on an instance to the local time zone or to another time zone in your network.

Use the instructions for your instance's operating system.

Linux

> **Important**
>
> This information applies to Amazon Linux. For information about other distributions, see their specific documentation.

To change the time zone on Amazon Linux

1. View the system's current time zone setting.

```
[ec2-user ~]$ timedatectl
```

2. List the available time zones.

```
[ec2-user ~]$ timedatectl list-timezones
```

3. Set the chosen time zone.

```
[ec2-user ~]$ sudo timedatectl set-timezone America/Vancouver
```

4. (Optional) Confirm that the current time zone is updated to the new time zone by running the **timedatectl** command again.

```
[ec2-user ~]$ timedatectl
```

Windows

To change the time zone on a Windows instance

1. From your instance, open a Command Prompt window.
2. Identify the time zone to use on the instance. To get a list of time zones, use the following command:

   ```
   tzutil /l
   ```

   This command returns a list of all available time zones in the following format:

   ```
   display name
   time zone ID
   ```

3. Locate the time zone ID to assign to the instance.
4. Example: Assign the UTC time zone:

   ```
   tzutil /s "UTC"
   ```

   Example: Assign Pacific Standard Time:

   ```
   tzutil /s "Pacific Standard Time"
   ```

When you change the time zone on a Windows instance, you must ensure that the time zone persists through system restarts. Otherwise, when the instance restarts, it reverts back to using UTC time. You can persist your time zone setting by adding a **RealTimeIsUniversal** registry key. This key is set by default on all current generation instances. To verify whether the **RealTimeIsUniversal** registry key is set, see step 3 in the following procedure. If the key is not set, follow these steps from the beginning.

To set the RealTimeIsUniversal registry key

1. From the instance, open a Command Prompt window.
2. Use the following command to add the registry key:

```
reg add "HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\TimeZoneInformation" /
v RealTimeIsUniversal /d 1 /t REG_DWORD /f
```

3. (Optional) Verify that the instance saved the key successfully using the following command:

```
reg query "HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control
\TimeZoneInformation" /s
```

This command returns the subkeys for the **TimeZoneInformation** registry key. You should see the **RealTimeIsUniversal** key at the bottom of the list, similar to the following:

```
HKEY_LOCAL_MACHINE\System\CurrentControlSet\Control\TimeZoneInformation
    Bias                            REG_DWORD     0x1e0
    DaylightBias                    REG_DWORD     0xffffffc4
    DaylightName                    REG_SZ        @tzres.dll,-211
    DaylightStart                   REG_BINARY    00000300020002000000000000000000
    StandardBias                    REG_DWORD     0x0
    StandardName                    REG_SZ        @tzres.dll,-212
    StandardStart                   REG_BINARY    00000B000100020000000000000000
    TimeZoneKeyName                 REG_SZ        Pacific Standard Time
    DynamicDaylightTimeDisabled     REG_DWORD     0x0
    ActiveTimeBias                  REG_DWORD     0x1a4
    RealTimeIsUniversal             REG_DWORD     0x1
```

Manage device drivers for your EC2 instance

Device drivers are software components that communicate with the virtualized hardware for your Amazon EC2 instance. To prevent system errors, performance issues, and other unexpected behavior, it's important to keep your drivers up-to-date. That's especially true for drivers that can have a strong impact on system performance depending on your usage, such as networking, graphics, and storage device drivers. New driver releases can include defect fixes or introduce expanded functionality that you might want to take advantage of for instances that are currently running.

Network drivers

Linux distributions can incorporate networking features like Elastic Network Adapter (ENA) or Elastic Fabric Adapter (EFA) within the kernel. However, the timing may vary for implementation of kernel driver features within the different distributions.

ENA and EFA Linux kernel drivers are available from the Amazon Drivers GitHub repository. For more information and links to the available drivers, see Amazon Drivers on GitHub.

For more information about ENA drivers, see Enable enhanced networking with ENA on your EC2 instances. For more information about EFA drivers, see **Getting started** topics in the Elastic Fabric Adapter for AI/ML and HPC workloads on Amazon EC2 section of this guide.

To install or update networking drivers on Windows instances, see the following topics:

- Install the ENA driver on Windows
- Install the latest AWS PV drivers

  For more information, see Paravirtual drivers for Windows instances.

> **Note**
>
> EFA is not supported on Windows instances.

Graphics drivers

To install or update graphics drivers, see the following topics:

- AMD drivers for your EC2 instance
- NVIDIA drivers for your Amazon EC2 instance

Storage device drivers

To install or update storage drivers, see the following topics:

- For Linux instances, see Install or upgrade the NVMe driver in the *Amazon EBS User Guide*.
- For Windows instances, see NVMe drivers.

Other Windows device drivers

To install or update other Windows device drivers, see the following topics:

- Other Windows device drivers

AMD drivers for your EC2 instance

An instance with an attached AMD GPU, such as a G4ad instance, must have the appropriate AMD driver installed. Depending on your requirements, you can either use an AMI with the driver preinstalled or download a driver from Amazon S3.

To install NVIDIA drivers on an instance with an attached NVIDIA GPU, such as a G4dn instance, see NVIDIA drivers instead.

Contents

- AMD Radeon Pro Software for Enterprise Driver
- AMIs with the AMD driver installed
- AMD driver download

AMD Radeon Pro Software for Enterprise Driver

The AMD Radeon Pro Software for Enterprise Driver is built to deliver support for professional-grade graphics use cases. Using the driver, you can configure your instances with two 4K displays per GPU.

Supported APIs

- OpenGL, OpenCL
- Vulkan
- AMD Advanced Media Framework
- Video Acceleration API
- DirectX 9 and later
- Microsoft Hardware Media Foundation Transform

AMIs with the AMD driver installed

AWS offers different Amazon Machine Images (AMIs) that come with the AMD drivers installed. Open Marketplace offerings with the AMD driver.

AMD driver download

If you aren't using an AMI with the AMD driver installed, you can download the AMD driver and install it on your instance. Only the following operating system versions support AMD drivers:

- Amazon Linux 2 with kernel version 5.10
- Ubuntu 24.04
- Windows Server 2016
- Windows Server 2019
- Windows Server 2022

These downloads are available to AWS customers only. By downloading, you agree to use the downloaded software only to develop AMIs for use with the AMD Radeon Pro V520 hardware. Upon installation of the software, you are bound by the terms of the AMD End User License Agreement.

Install the AMD driver on your Amazon Linux 2 Linux instance

1. Connect to your Linux instance.
2. Install the AWS CLI on your Linux instance and configure default credentials. For more information, see Installing the AWS CLI in the *AWS Command Line Interface User Guide*.

   > **Important**
   >
   > Your user or role must have the permissions granted that contains the **AmazonS3ReadOnlyAccess** policy. For more information, see AWS managed policy: AmazonS3ReadOnlyAccess in the *Amazon Simple Storage Service User Guide*.

3. Install **gcc**, **make**, and **dialog**, if they are not already installed.

   ```
   $ sudo yum install -y gcc make dialog
   ```

4. Update your package cache and get the package updates for your instance.

```
$ sudo amazon-linux-extras install epel -y
$ sudo yum update -y
```

5. Reboot the instance.

```
$ sudo reboot
```

6. Reconnect to the instance after it reboots.
7. Download the latest AMD driver.

```
$ aws s3 cp --recursive s3://ec2-amd-linux-drivers/latest/ .
```

8. Extract the file.

```
$ tar -xzf amdgpu-pro-*rhel*.tar.gz
```

9. Install the **amdgpu-install** package. Replace *version* with the version directory name that was created when you extracted the driver.

```
$ cd rhel_7/version/x86_64/a/
$ sudo yum install -y ./amdgpu-install-*.el7.noarch.rpm
```

10. Edit `/etc/yum.repos.d/amdgpu.repo`. Set `baseurl` to the extracted `x86_64` directory (for example, `baseurl=file:///home/ec2-user/rhel_7/version/x86_64/`). Set `gpgcheck=0`.
11. Edit `/etc/yum.repos.d/amdgpu-proprietary.repo`. Set `baseurl` to the same directory. Set `gpgcheck=0` and `enabled=1`.
12. Edit `/etc/yum.repos.d/rocm.repo`. Set `baseurl` to the same directory. Set `gpgcheck=0`.
13. Install the AMD GPU driver for Amazon Linux 2.

```
$ sudo amdgpu-install --usecase=workstation --vulkan=pro --accept-eula -y
```

14. Reboot the instance.

```
$ sudo reboot
```

15. Confirm that the driver is functional.

```
$ sudo dmesg | grep amdgpu
```

The response should look like the following:

```
Initialized amdgpu
```

Install the AMD driver on your Ubuntu Linux instance

1. Connect to your Linux instance.
2. Update your package cache and get the package updates for your instance.

```
$ sudo apt-get update -y && sudo apt-get upgrade -y
```

3. Install Linux firmware and kernel modules.

```
$ sudo apt install -y linux-firmware linux-modules-extra-$(uname -r)
```

4. Reboot the instance.

```
$ sudo reboot
```

5. Reconnect to the instance after it reboots.
6. Download the latest AMD driver package for Ubuntu 24.04 from Linux® Drivers for AMD Radeon™ Graphics on the AMD website. In the following command, replace *version* with the version string from the downloaded filename (for example, `31.30.313000-1_all`).

```
$ sudo apt install -y ./amdgpu-install_version.deb
```

7. Install the AMD GPU driver for Ubuntu.

```
$ sudo amdgpu-install --usecase=graphics --vulkan=radv -y
```

8. Reboot the instance.

```
$ sudo reboot
```

9. Confirm that the driver is functional.

```
$ sudo dmesg | grep amdgpu
```

The response should look like the following:

```
Initialized amdgpu
```

Install the AMD driver on your Windows instance

1. Connect to your Windows instance and open a PowerShell window.
2. Configure default credentials for the AWS Tools for Windows PowerShell on your Windows instance. For more information, see Getting Started with the AWS Tools for Windows PowerShell in the *AWS Tools for PowerShell User Guide*.

   > **Important**
   >
   > Your user or role must have the permissions granted that contains the **AmazonS3ReadOnlyAccess** policy. For more information, see AWS managed policy: AmazonS3ReadOnlyAccess in the *Amazon Simple Storage Service User Guide*.

3. Set the key prefix according to your version of Windows:

   - Windows 10 and Windows 11

     ```
     $KeyPrefix = "latest/AMD_GPU_WINDOWS10"
     ```

   - Windows Server 2016

     ```
     $KeyPrefix = "archives"
     ```

   - Windows Server 2019

     ```
     $KeyPrefix = "latest/AMD_GPU_WINDOWS_2K19" # use "archives" for Windows Server
      2016
     ```

   - Windows Server 2022

     ```
     $KeyPrefix = "latest/AMD_GPU_WINDOWS_2K22"
     ```

4. Download the drivers from Amazon S3 to your desktop using the following PowerShell commands.

```
$Bucket = "ec2-amd-windows-drivers"
$LocalPath = "$home\Desktop\AMD"
$Objects = Get-S3Object -BucketName $Bucket -KeyPrefix $KeyPrefix -Region us-east-1
foreach ($Object in $Objects) {
$LocalFileName = $Object.Key
if ($LocalFileName -ne '' -and $Object.Size -ne 0) {
    $LocalFilePath = Join-Path $LocalPath $LocalFileName
    Copy-S3Object -BucketName $Bucket -Key $Object.Key -LocalFile $LocalFilePath -
Region us-east-1
    }
}
```

5. Unzip the downloaded driver file and run the installer using the following PowerShell commands.

```
Expand-Archive $LocalFilePath -DestinationPath "$home\Desktop\AMD\$KeyPrefix" -
Verbose
```

Now, check the content of the new directory. The directory name can be retrieved using the `Get-ChildItem` PowerShell command.

```
Get-ChildItem "$home\Desktop\AMD\$KeyPrefix"
```

The output should be similar to the following:

```
Directory: C:\Users\Administrator\Desktop\AMD\latest

Mode                 LastWriteTime         Length Name
----                 -------------         ------ ----
d-----       10/13/2021  12:52 AM                210414a-365562C-Retail_End_User.2
```

Install the drivers:

```
pnputil /add-driver $home\Desktop\AMD\$KeyPrefix\*.inf /install /subdirs
```

6. Follow the instructions to install the driver and reboot your instance as required.

7. To verify that the GPU is working properly, check Device Manager. You should see "AMD Radeon Pro V520 MxGPU" listed as a display adapter.
8. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol, Amazon DCV.

NVIDIA drivers for your Amazon EC2 instance

An instance with an attached NVIDIA GPU, such as a P- or G- series instance types, must have the appropriate NVIDIA driver installed. Depending on the instance type, you can either download a public NVIDIA driver, download a driver from Amazon S3 that is available only to AWS customers, or use an AWS AMI with the driver pre-installed.

To install AMD drivers on an instance with an attached AMD GPU, such as a G4ad instance, see AMD drivers instead.

Topics

- Types of NVIDIA drivers
- Available drivers by instance type
- Installation options
- Use AMIs that include NVIDIA drivers
- Install NVIDIA public drivers
- Install NVIDIA GRID drivers (G7e, G6, Gr6, G6e, G6f, Gr6f, G5, G4dn, and G3 instances)
- Install NVIDIA gaming drivers (G7e, G6, G6e, G5, and G4dn instances)

Types of NVIDIA drivers

The following are the main types of NVIDIA drivers that can be used with GPU-based instances.

Tesla drivers

These drivers are intended primarily for compute workloads, which use GPUs for computational tasks such as parallelized floating-point calculations for machine learning and fast Fourier transforms for high performance computing applications.

GRID drivers

These drivers are certified to provide optimal performance for professional visualization applications that render content such as 3D models or high-resolution videos. You can configure

GRID drivers to support two modes. Quadro Virtual Workstations provide access to four 4K displays per GPU. GRID vApps provide RDSH App hosting capabilities.

Gaming drivers

These drivers contain optimizations for gaming and are updated frequently to provide performance enhancements. They support a single 4K display per GPU.

Configured mode

On Windows, the Tesla drivers are configured to run in Tesla Compute Cluster (TCC) mode. The GRID and gaming drivers are configured to run in Windows Display Driver Model (WDDM) mode. In TCC mode, the card is dedicated to compute workloads. In WDDM mode, the card supports both compute and graphics workloads.

NVIDIA control panel

The NVIDIA control panel is supported with GRID and Gaming drivers. It is not supported with Tesla drivers.

Supported APIs for Tesla, GRID, and gaming drivers

- OpenCL, OpenGL, and Vulkan
- NVIDIA CUDA and related libraries (for example, cuDNN, TensorRT, nvJPEG, and cuBLAS)
- NVENC for video encoding and NVDEC for video decoding
- Windows-only APIs: DirectX, Direct2D, DirectX Video Acceleration, DirectX Raytracing

Available drivers by instance type

The following table summarizes the supported NVIDIA drivers for each GPU instance type.

Instance type	Tesla driver	GRID driver	Gaming driver
G3	Yes	Yes	No
G4dn	Yes	Yes	Yes
G5	Yes	Yes	Yes

Instance type	Tesla driver	GRID driver	Gaming driver
G5g	Yes [1]	No	No
G6	Yes	Yes	Yes
G6e	Yes	Yes	Yes
G6f	No	Yes	No
Gr6	Yes	Yes	No
Gr6f	No	Yes	No
G7e	Yes	Yes	Yes
P3	Yes	No	No
P4d	Yes	No	No
P4de	Yes	No	No
P5	Yes	No	No
P5e	Yes	No	No
P5en	Yes	No	No
P6-B200	Yes	No	No
P6e-GB200	Yes	No	No
P6-B300	Yes	No	No

[1] This Tesla driver also supports optimized graphics applications specific to the ARM64 platform

Installation options

Use one of the following options to get the NVIDIA drivers required for your GPU instance.

Options

1. Use AMIs that include NVIDIA drivers
2. Install NVIDIA public drivers
3. Install NVIDIA GRID drivers (G7e, G6, Gr6, G6e, G6f, Gr6f, G5, G4dn, and G3 instances)
4. Install NVIDIA gaming drivers (G7e, G6, G6e, G5, and G4dn instances)

Use AMIs that include NVIDIA drivers

AWS and NVIDIA offer different Amazon Machine Images (AMIs) that come with the NVIDIA drivers installed.

- Marketplace offerings with the Tesla public driver
- Marketplace offerings with the GRID driver
- Marketplace offerings with the Gaming driver

To review considerations that are dependent on your operating system (OS) platform, choose the tab that applies to your AMI.

Linux

To update the driver version installed using one of these AMIs, you must uninstall the NVIDIA packages from your instance to avoid version conflicts. Use this command to uninstall the NVIDIA packages:

```
[ec2-user ~]$ sudo yum erase nvidia cuda
```

The CUDA toolkit package has dependencies on the NVIDIA drivers. Uninstalling the NVIDIA packages erases the CUDA toolkit. You must reinstall the CUDA toolkit after installing the NVIDIA driver.

Windows

If you create a custom Windows AMI using one of the AWS Marketplace offerings, the AMI must be a standardized image created with Windows Sysprep to ensure that the GRID driver works. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.

Install NVIDIA public drivers

If the AWS Marketplace AMIs described in Use AMIs that include NVIDIA drivers don't fit your use case, you can install the public drivers and bring your own license. Installation options include the following:

- Option 1: Driver-only install
- Option 2: Install with the CUDA toolkit (recommended for Linux distributions)

P6-B200 and P6-B300 instance type considerations

The P6-B200 and P6-B300 platforms are unique in that they expose Mellanox ConnectX network interface cards (NICs) to the instance as PCIe devices. These NICs do not act as typical network interfaces but instead function as NVSwitch bridges providing a control path to initialize and configure the NVFabric, which is the NVLink topology of the GPU interconnect.

To fully initialize the system, the NVIDIA Fabric Manager must configure `NVFabric` and establish the NVSwitch topology. This enables InfiniBand kernel modules to communicate with the Mellanox ConnectX NICs.

NVIDIA Fabric Manager is included in the CUDA toolkit. We recommend Option 2: Install with the CUDA toolkit for this instance type.

Option 1: Driver-only install

To install a specific driver, log on to your instance and download the 64-bit NVIDIA public driver for the instance type from http://www.nvidia.com/Download/Find.aspx. For **Product Type**, **Product Series**, and **Product**, use the options shown in the following table.

Then follow the **Local Repository Installation** instructions in the NVIDIA Driver Installation Guide.

> **Note**
>
> P6-B200 and P6-B300 instance types require installation and configuration of additional packages that come bundled with the NVIDIA CUDA Toolkit. For more information, see instructions for your Linux distribution in Option 2: Install with the CUDA toolkit.

Instance	Product type	Product series	Product	Minimum driver version
G3	Tesla	M-Class	M60	--
G4dn	Tesla	T-Series	T4	--
G5	Tesla	A-Series	A10	470.00 or later
G5g[1]	Tesla	T-Series	T4G	470.82.01 or later
G6	Tesla	L-Series	L4	525.0 or later
G6e	Tesla	L-Series	L40S	535.0 or later
Gr6	Tesla	L-Series	L4	525.0 or later
G7	Tesla	RTX series	RTX PRO 4500 Blackwell	595 or later
G7e	Tesla	RTX series	RTX PRO 6000 Blackwell	575.0 or later
P3	Tesla	V-Series	V100	--
P4d	Tesla	A-Series	A100	--
P4de	Tesla	A-Series	A100	--
P5	Tesla	H-Series	H100	530 or later
P5e	Tesla	H-Series	H200	550 or later
P5en	Tesla	H-Series	H200	550 or later
P6-B200[2]	Tesla	HGX-Series	B200	570 or later
P6e-GB200	Tesla	HGX-Series	B200	570 or later
P6-B300[2]	Tesla	HGX-Series	B300	580 or later

[1] The operating system for G5g instances is Linux aarch64.

[2] For P6-B200 and P6-B300 instance types, there are additional installation requirements to configure NVIDIA Fabric Manager.

Option 2: Install with the CUDA toolkit

Install instructions vary slightly by operating system. To install public drivers on your instance with the NVIDIA CUDA toolkit, follow the instructions for your instance operating system. For instance operating systems that aren't shown here, follow the instructions for your operating system and instance type architecture on the NVIDIA Developer website. For more information, see CUDA Toolkit Downloads.

For instance type architecture or other specifications, see the Accelerated computing specifications in the *Amazon EC2 Instance Types* reference.

Amazon Linux 2023

This section covers an NVIDIA CUDA toolkit install on an Amazon Linux 2023 instance. The command examples in this section are based on an `x86_64` architecture.

For `arm64-sbsa` commands, see CUDA Toolkit Downloads and select the options that apply to your distribution. Instructions appear after you've made your final selection.

Prerequisite

Before installing the toolkit and drivers, run the following command to ensure that you have the correct version of the kernel headers and development packages.

```
[ec2-user ~]$ sudo dnf install kernel-devel-$(uname -r) kernel-headers-$(uname -r) -y
```

Download the toolkit and drivers

Choose the type of installation to use for your instance, and follow the associated steps.

AL2023 NVIDIA repository

Amazon Linux 2023 provides NVIDIA GPU drivers and CUDA toolkit packages through a dedicated repository that AWS maintains. AWS qualifies this repository with AL2023 release candidates and provides security advisories through the Amazon Linux Security Center. We

recommend this option for AL2023 instances because it simplifies installation and keeps drivers updated through the standard `dnf update` workflow.

For instructions, see NVIDIA drivers in the *Amazon Linux 2023 User Guide*.

RPM local installation

You can follow these instructions to download the CUDA toolkit installer repository bundle to your instance, then extract and register the specified bundle.

To view instructions on the NVIDIA developer website, see CUDA Toolkit Downloads.

```
[ec2-user ~]$ wget https://developer.download.nvidia.com/compute/cuda/13.0.0/
local_installers/cuda-repo-amzn2023-13-0-local-13.0.0_580.65.06-1.x86_64.rpm
[ec2-user ~]$ sudo rpm -i cuda-repo-amzn2023-13-0-
local-13.0.0_580.65.06-1.x86_64.rpm
```

RPM network installation

You can follow these instructions to register the CUDA repository with the package manager on your instance. When you run the install steps, the package manager downloads only the packages that are required.

To view instructions on the NVIDIA developer website, see CUDA Toolkit Downloads.

```
[ec2-user ~]$ sudo dnf config-manager --add-repo https://
developer.download.nvidia.com/compute/cuda/repos/amzn2023/x86_64/cuda-amzn2023.repo
```

Remaining steps are the same for both RPM local and RPM network installation.

1. Complete the CUDA toolkit install

```
[ec2-user ~]$ sudo dnf clean all
[ec2-user ~]$ sudo dnf install cuda-toolkit -y
```

2. Install the open kernel module variant of the driver

```
[ec2-user ~]$ sudo dnf module install nvidia-driver:open-dkms -y
```

3. Install GPUDirect Storage and Fabric Manager

```
[ec2-user ~]$ sudo dnf install nvidia-gds -y
[ec2-user ~]$ sudo dnf install nvidia-fabric-manager -y
```

4. Enable Fabric Manager and driver persistence

```
[ec2-user ~]$ sudo systemctl enable nvidia-fabricmanager
[ec2-user ~]$ sudo systemctl enable nvidia-persistenced
```

5. (*P6-B200 and P6-B300 only*) These instance types require installation and configuration of additional packages that come bundled with the NVIDIA CUDA Toolkit.

   1. Install NVIDIA Link Subnet Manager and `ibstat`.

      ```
      [ec2-user ~]$ sudo dnf install nvlink5
      ```

   2. Enable automatic loading of the Infiniband module on startup.

      ```
      [ec2-user ~]$ echo "ib_umad" | sudo tee -a /etc/modules-load.d/modules.conf
      ```

6. Reboot the instance

```
[ec2-user ~]$ sudo reboot
```

Ubuntu 24.04

This section covers an NVIDIA CUDA toolkit install on an Ubuntu 24.04 instance. The command examples in this section are based on an `x86_64` architecture.

For `arm64-sbsa` commands, see CUDA Toolkit Downloads and select the options that apply to your distribution. Instructions appear after you've made your final selection.

Prerequisite

Before installing the toolkit and drivers, run the following command to ensure that you have the correct version of the kernel headers and development packages.

```
$ apt install linux-headers-$(uname -r)
```

Download the toolkit and drivers

Choose the type of installation to use for your instance, and follow the associated steps.

Deb local installation

You can follow these instructions to download the CUDA toolkit installer repository bundle to your instance, then extract and register the specified bundle.

To view instructions on the NVIDIA developer website, see CUDA Toolkit Downloads.

```
$ wget https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2404/
x86_64/cuda-ubuntu2404.pin
$ sudo mv cuda-ubuntu2404.pin /etc/apt/preferences.d/cuda-repository-pin-600
$ wget https://developer.download.nvidia.com/compute/cuda/13.0.0/
local_installers/cuda-repo-ubuntu2404-13-0-local_13.0.0-580.65.06-1_amd64.deb
$ sudo dpkg -i cuda-repo-ubuntu2404-13-0-local_13.0.0-580.65.06-1_amd64.deb
$ sudo cp /var/cuda-repo-ubuntu2404-13-0-local/cuda-*-keyring.gpg /usr/share/
keyrings/
```

Deb network installation

You can follow these instructions to register the CUDA repository with the package manager on your instance. When you run the install steps, the package manager downloads only the packages that are required.

To view instructions on the NVIDIA developer website, see CUDA Toolkit Downloads.

```
$ wget https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2404/x86_64/
cuda-keyring_1.1-1_all.deb
$ sudo dpkg -i cuda-keyring_1.1-1_all.deb
```

Remaining steps are the same for both local and network installation.

1. Complete the CUDA toolkit install

```
$ sudo apt update
$ sudo apt install cuda-toolkit -y
```

2. Install the open kernel module variant of the driver

```
$ sudo apt install nvidia-open -y
```

3. Install GPUDirect Storage and Fabric Manager

```
$ sudo apt install nvidia-gds -y
$ sudo apt install nvidia-fabricmanager -y
```

4. Enable Fabric Manager and driver persistence

```
$ sudo systemctl enable nvidia-fabricmanager
$ sudo systemctl enable nvidia-persistenced
```

5. (*P6-B200 and P6-B300 only*) These instance types require installation and configuration of additional packages that come bundled with the NVIDIA CUDA Toolkit.

   1. Install the latest InfiniBand-specific device driver and diagnostic utilities.

      ```
      $ sudo apt install linux-modules-extra-$(uname -r) -y
      $ sudo apt install infiniband-diags -y
      ```

   2. Install NVIDIA Link Subnet Manager.

      ```
      $ sudo apt install nvlsm -y
      ```

6. Reboot the instance

```
sudo reboot
```

7. Update your path and add the following environment variable.

```
$ export PATH=${PATH}:/usr/local/cuda-13.0/bin
$ export LD_LIBRARY_PATH=${LD_LIBRARY_PATH}:/usr/local/cuda-13.0/lib64
```

Windows operating systems

To install the NVIDIA driver on Windows, follow these steps:

1. Open the folder where you downloaded the driver and launch the installation file. Follow the instructions to install the driver and reboot your instance as required.
2. Disable the display adapter named **Microsoft Basic Display Adapter** that is marked with a warning icon using Device Manager. Install these Windows features: **Media Foundation** and **Quality Windows Audio Video Experience**.

> **Important**
>
> Don't disable the display adapter named **Microsoft Remote Display Adapter**. If **Microsoft Remote Display Adapter** is disabled your connection might be interrupted and attempts to connect to the instance after it has rebooted might fail.

3. Check Device Manager to verify that the GPU is working correctly.
4. To achieve the best performance from your GPU, complete the optimization steps in Optimize GPU settings on Amazon EC2 instances.

Install NVIDIA GRID drivers (G7e, G6, Gr6, G6e, G6f, Gr6f, G5, G4dn, and G3 instances)

These downloads are available to AWS customers only. By downloading, to adhere to requirements of the AWS solution referred to in the NVIDIA GRID Cloud End User License Agreement (EULA), you agree to use the downloaded software only to develop AMIs for use with the NVIDIA L4, NVIDIA L40S, NVIDIA A10G, NVIDIA Tesla T4, or NVIDIA Tesla M60 hardware. You can use the GRID drivers to both create and use AMIs within the AWS environment. Upon installation of the software, you are bound by the terms of the NVIDIA GRID Cloud End User License Agreement. For information about the version of the NVIDIA GRID driver for your operating system, see the NVIDIA Virtual GPU (vGPU) Software on the NVIDIA website.

Considerations

- G7e instances require GRID 19.1 or later for Linux and 19.4 (582.16) or later for Windows.
- G6f and Gr6f instances require GRID 18.4 to GRID 19.5.
- G6e instances require GRID 17.4 or later.
- G6 and Gr6 instances require GRID 17.1 or later.
- G5 instances require GRID 13.1 or later (or GRID 12.4 or later).
- G3 instances require AWS provided DNS resolution for GRID licensing to work.
- IMDSv2 is only supported with NVIDIA driver version 14.0 or greater.
- For Windows instances, if you launch your instance from a custom Windows AMI, the AMI must be a standardized image created with Windows Sysprep to ensure that the GRID driver works. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.

- GRID 17.0 and later do not support Windows Server 2019.
- GRID 14.2 and later do not support Windows Server 2016.
- GRID 17.0 and later is not supported with G3 instances.
- For Linux instances, you might need to install or update packages, such as gcc, if the NVIDIA installer fails with an error message. The specifics depend on the versions of the operating system and the kernel. For more information, see the NVIDIA Enterprise Support Portal.

Prerequisites

- (Linux) Verify that the AWS CLI is installed on your instance and configured with default credentials. For more information, see Installing the AWS CLI in the *AWS Command Line Interface User Guide*.
- (Windows) Configure default credentials for the AWS Tools for Windows PowerShell on your instance. For more information, see Getting started with the AWS Tools for Windows PowerShell in the *AWS Tools for PowerShell User Guide*.
- Your user or role must have the permissions granted that contains the **AmazonS3ReadOnlyAccess** policy.

Amazon Linux 2023

To install the NVIDIA GRID driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo dnf update -y
```

2. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo dnf install gcc make
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers packages.

```
[ec2-user ~]$ sudo dnf install -y kernel-devel kernel-modules-extra
```

6. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

7. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

Amazon Linux 2

To install the NVIDIA GRID driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

2. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install gcc make
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel that is running.

```
[ec2-user ~]$ sudo yum install -y kernel-devel-$(uname -r)
```

6. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

7. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

   If you are using Amazon Linux 2 with kernel version 5.10, use the following command to install the GRID driver.

```
[ec2-user ~]$ sudo CC=/usr/bin/gcc10-cc ./NVIDIA-Linux-x86_64*.run
```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

    a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

    b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual

Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

CentOS 7 and Red Hat Enterprise Linux 7

To install the NVIDIA GRID driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

2. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install -y gcc make
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel that you are running.

```
[ec2-user ~]$ sudo yum install -y kernel-devel-$(uname -r)
```

6. Disable the nouveau open source driver for NVIDIA graphics cards.

   a. Add nouveau to the `/etc/modprobe.d/blacklist.conf` blacklist file. Copy the following code block and paste it into a terminal.

```
[ec2-user ~]$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

   b. Edit the `/etc/default/grub` file and add the following line:

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

c. Rebuild the Grub configuration.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

8. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

9. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

11. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

12. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

13. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

    a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

    b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

    c. Install the GUI desktop/workstation package.

    ```
    [ec2-user ~]$ sudo yum groupinstall -y "Server with GUI"
    ```

CentOS Stream 8 and Red Hat Enterprise Linux 8

To install the NVIDIA GRID driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

   ```
   [ec2-user ~]$ sudo yum update -y
   ```

2. Install **gcc** and **make**, if they are not already installed.

   ```
   [ec2-user ~]$ sudo yum install -y gcc make
   ```

3. Reboot your instance to load the latest kernel version.

   ```
   [ec2-user ~]$ sudo reboot
   ```

4. Reconnect to your instance after it has rebooted.

5. Install the kernel headers package for the version of the kernel that you are running.

   ```
   [ec2-user ~]$ sudo dnf install -y elfutils-libelf-devel libglvnd-devel kernel-
   devel-$(uname -r)
   ```

6. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

7. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

    a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

c. Install the GUI workstation package.

```
[ec2-user ~]$ sudo dnf groupinstall -y workstation
```

Rocky Linux 8

To install the NVIDIA GRID driver on your Linux instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

2. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install -y gcc make
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel that you are running.

```
[ec2-user ~]$ sudo dnf install -y elfutils-libelf-devel libglvnd-devel kernel-
devel-$(uname -r)
```

6. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

7. Add permissions to run the driver installation utility using the following command.

```
[ec2-user ~]$ chmod +x NVIDIA-Linux-x86_64*.run
```

8. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
[ec2-user ~]$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

9. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
[ec2-user ~]$ nvidia-smi -q | head
```

10. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

11. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

12. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

    a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

    b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

Ubuntu and Debian

To install the NVIDIA GRID driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

   ```
   $ sudo apt-get update -y
   ```

2. Install **gcc** and **make**, if they are not already installed.

   ```
   $ sudo apt-get install -y gcc make
   ```

3. (Ubuntu) Upgrade the `linux-aws` package to receive the latest version.

   ```
   $ sudo apt-get upgrade -y linux-aws
   ```

   (Debian) Upgrade package to receive the latest version.

   ```
   $ sudo apt-get upgrade -y
   ```

4. Reboot your instance to load the latest kernel version.

   ```
   $ sudo reboot
   ```

5. Reconnect to your instance after it has rebooted.
6. Install the kernel headers package for the version of the kernel you are currently running.

   ```
   $ sudo apt-get install -y linux-headers-$(uname -r) linux-modules-extra-$(uname -r)
   ```

7. Disable the `nouveau` open source driver for NVIDIA graphics cards.

   a. Add `nouveau` to the `/etc/modprobe.d/blacklist.conf` blacklist file. Copy the following code block and paste it into a terminal.

   ```
   $ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
   blacklist vga16fb
   blacklist nouveau
   blacklist rivafb
   blacklist nvidiafb
   blacklist rivatv
   ```

```
EOF
```

b. Edit the `/etc/default/grub` file and add the following line:

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

c. Rebuild the Grub configuration.

```
$ sudo update-grub
```

8. Download the GRID driver installation utility using the following command:

   Multiple versions of the GRID driver are stored in this bucket. You can see all of the available versions using the following command.

9. Add permissions to run the driver installation utility using the following command.

```
$ chmod +x NVIDIA-Linux-x86_64*.run
```

10. Run the self-install script as follows to install the GRID driver that you downloaded. For example:

```
$ sudo /bin/sh ./NVIDIA-Linux-x86_64*.run
```

    When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Confirm that the driver is functional. The response for the following command lists the installed version of the NVIDIA driver and details about the GPUs.

```
$ nvidia-smi -q | head
```

12. If you are using NVIDIA vGPU software version 14.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/
modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
$ sudo reboot
```

14. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

    a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

    b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

    c. Install the GUI desktop/workstation package.

```
$ sudo apt-get install -y lightdm ubuntu-desktop
```

Windows operating systems

To install the NVIDIA GRID driver on your Windows instance

1. Connect to your Windows instance and open a PowerShell window.
2. Download the drivers and the NVIDIA GRID Cloud End User License Agreement from Amazon S3 to your desktop using the following PowerShell commands.

   Multiple versions of the NVIDIA GRID driver are stored in this bucket. You can download all of the available Windows versions in the bucket by removing the `-KeyPrefix $KeyPrefix` option. For information about the version of the NVIDIA GRID driver for your operating system, see the NVIDIA Virtual GPU (vGPU) Software on the NVIDIA website.

   Starting with GRID version 11.0, you can use the drivers under `latest` for both G3 and G4dn instances. We will not add versions later than 11.0 to `g4/latest`, but will keep version 11.0 and the earlier versions specific to G4dn under `g4/latest`.

   G5 instances require GRID 13.1 or later (or GRID 12.4 or later).
3. Navigate to the desktop and open the installation file to launch it (choose the driver version that corresponds to your instance OS version). Follow the instructions to install the driver and

reboot your instance as required. To verify that the GPU is working properly, check Device Manager.

4. (Optional) Use the following command to disable the licensing page in the control panel to prevent users from accidentally changing the product type (NVIDIA GRID Virtual Workstation is enabled by default). For more information, see the GRID Licensing User Guide.

   PowerShell

   Run the following PowerShell commands to create the registry value to disable the licensing page in the control panel. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

   ```
   New-Item -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global" -Name GridLicensing
   New-ItemProperty -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global\GridLicensing" -
   Name "NvCplDisableManageLicensePage" -PropertyType "DWord" -Value "1"
   ```

   Command Prompt

   Run the following registry command to create the registry value to disable the licensing page in the control panel. You can run it using the Command Prompt window or a 64-bit version of PowerShell.

   ```
   reg add "HKLM\SOFTWARE\NVIDIA Corporation\Global\GridLicensing" /v
    NvCplDisableManageLicensePage /t REG_DWORD /d 1
   ```

5. (Optional) Depending on your use case, you might complete the following optional steps. If you do not require this functionality, do not complete these steps.

   a. To help take advantage of the four displays of up to 4K resolution, set up the high-performance display protocol, Amazon DCV.

   b. NVIDIA Quadro Virtual Workstation mode is enabled by default. To activate GRID Virtual Applications for RDSH Application hosting capabilities, complete the GRID Virtual Application activation steps in Activate NVIDIA GRID Virtual Applications on your Amazon EC2 GPU-based instances.

Install NVIDIA gaming drivers (G7e, G6, G6e, G5, and G4dn instances)

These drivers are available to AWS customers only. By downloading them, you agree to use the downloaded software only to develop AMIs for use with the RTX PRO 6000 Blackwell, NVIDIA L4, NVIDIA L40S, NVIDIA A10G, NVIDIA Tesla T4, or NVIDIA Tesla M60 hardware. You can use the GRID drivers to both create and use AMIs within the AWS environment. Upon installation of the software, you are bound by the terms of the NVIDIA GRID Cloud End User License Agreement.

Considerations

- G3 instances require AWS provided DNS resolution for GRID licensing to work.
- IMDSv2 is only supported with NVIDIA driver version 495.x or greater.

Prerequisites

- (Linux) Verify that the AWS CLI is installed on your instance and configured with default credentials. For more information, see Installing the AWS CLI in the *AWS Command Line Interface User Guide*.
- Your user or role must have the permissions granted that contains the **AmazonS3ReadOnlyAccess** policy.

Amazon Linux 2023

To install the NVIDIA gaming driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

   ```
   [ec2-user ~]$ sudo dnf update -y
   ```

2. Install **gcc** and **make**, if they are not already installed.

   ```
   [ec2-user ~]$ sudo dnf install gcc make
   ```

3. Reboot your instance to load the latest kernel version.

   ```
   [ec2-user ~]$ sudo reboot
   ```

4. Reconnect to your instance after it is rebooted.

5. Install the kernel headers packages.

```
[ec2-user ~]$ sudo dnf install -y kernel-devel kernel-modules-extra kernel-devel-
$(uname -r) kernel-headers-$(uname -r) dkms
```

6. Download the gaming driver installation utility using the following command:

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

7. Extract the gaming driver installation utility from the downloaded `.zip` archive.

```
[ec2-user ~]$ unzip latest-driver-name.zip -d nvidia-drivers
```

8. Add permissions to run the driver installation utility using the following command:

```
[ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
```

9. Run the installer using the following command:

```
[ec2-user ~]$ sudo ./nvidia-drivers/NVIDIA-Linux-x86_64*.run
```

   When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

11. Use the following command to download and rename the certification file.

    - For version 590.48 or later:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
```

    - For version 575.64 to 580.105.08:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
```

- For version 460.39 to 575.57:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
```

- For version 440.68 to 445.48:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
```

- For earlier versions:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

14. Verify the NVIDIA Gaming license using the following command.

```
[ec2-user ~]$ nvidia-smi.exe -q
```

    In the output, search for `vGPU Software Licensed Product`.

15. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

Amazon Linux 2

To install the NVIDIA gaming driver on your instance

1. Connect to your instance. Update your package cache and get the package updates for your instance.

   ```
   [ec2-user ~]$ sudo yum update -y
   ```

2. Install **gcc** and **make**, if they are not already installed.

   ```
   [ec2-user ~]$ sudo yum install gcc make
   ```

3. Reboot your instance to load the latest kernel version.

   ```
   [ec2-user ~]$ sudo reboot
   ```

4. Reconnect to your instance after it is rebooted.
5. Install the kernel headers package for the version of the kernel you are currently running.

   ```
   [ec2-user ~]$ sudo yum install -y kernel-devel-$(uname -r)
   ```

6. Download the gaming driver installation utility using the following command:

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

7. Extract the gaming driver installation utility from the downloaded `.zip` archive.

   ```
   [ec2-user ~]$ unzip latest-driver-name.zip -d nvidia-drivers
   ```

8. Add permissions to run the driver installation utility using the following command:

   ```
   [ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
   ```

9. Run the installer using the following command:

   ```
   [ec2-user ~]$ sudo ./nvidia-drivers/NVIDIA-Linux-x86_64*.run
   ```

   If you are using Amazon Linux 2 with kernel version 5.10, use the following command to install the NVIDIA gaming drivers.

```
[ec2-user ~]$ sudo CC=/usr/bin/gcc10-cc ./NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

11. Use the following command to download and rename the certification file.

    - For version 590.48 or later:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
      gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
      ```

    - For version 575.64 to 580.105.08:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
      gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
      ```

    - For version 460.39 to 575.57:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
      gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
      ```

    - For version 440.68 to 445.48:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
      gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
      ```

    - For earlier versions:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
      gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
      ```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

14. Verify the NVIDIA Gaming license using the following command.

```
[ec2-user ~]$ nvidia-smi.exe -q
```

    In the output, search for `vGPU Software Licensed Product`.

15. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

CentOS 7 and Red Hat Enterprise Linux 7

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install -y gcc make
```

2. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel you are currently running.

```
[ec2-user ~]$ sudo yum install -y unzip kernel-devel-$(uname -r)
```

6. Disable the nouveau open source driver for NVIDIA graphics cards.

   a. Add nouveau to the `/etc/modprobe.d/blacklist.conf` blacklist file. Copy the following code block and paste it into a terminal.

   ```
   [ec2-user ~]$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
   blacklist vga16fb
   blacklist nouveau
   blacklist rivafb
   blacklist nvidiafb
   blacklist rivatv
   EOF
   ```

   b. Edit the `/etc/default/grub` file and add the following line:

   ```
   GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
   ```

   c. Rebuild the Grub configuration.

   ```
   [ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
   ```

7. Download the gaming driver installation utility using the following command:

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

8. Extract the gaming driver installation utility from the downloaded `.zip` archive.

   ```
   [ec2-user ~]$ unzip *Gaming-Linux-Guest-Drivers.zip -d nvidia-drivers
   ```

9. Add permissions to run the driver installation utility using the following command:

   ```
   [ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
   ```

10. Run the installer using the following command:

    ```
    [ec2-user ~]$ sudo nvidia-drivers/NVIDIA-Linux-x86_64*.run
    ```

    When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

11. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

12. Use the following command to download and rename the certification file.
    - For version 590.48 or later:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
      ```

    - For version 575.64 to 580.105.08:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
      ```

    - For version 460.39 to 575.57:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
      ```

    - For version 440.68 to 445.48:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
      ```

    - For earlier versions:

      ```
      [ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
      ```

13. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

    ```
    [ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
    ```

    ```
    [ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/modprobe.d/nvidia.conf
    ```

14. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

15. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV. If you do not require this functionality, do not complete this step.

CentOS Stream 8 and Red Hat Enterprise Linux 8

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install -y gcc make
```

2. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel you are currently running.

```
[ec2-user ~]$ sudo yum install -y unzip kernel-devel-$(uname -r)
```

6. Download the gaming driver installation utility using the following command:

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

7. Extract the gaming driver installation utility from the downloaded `.zip` archive.

```
[ec2-user ~]$ unzip *Gaming-Linux-Guest-Drivers.zip -d nvidia-drivers
```

8. Add permissions to run the driver installation utility using the following command:

```
[ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
```

9. Run the installer using the following command:

```
[ec2-user ~]$ sudo nvidia-drivers/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

11. Use the following command to download and rename the certification file.

- For version 590.48 or later:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
```

- For version 575.64 to 580.105.08:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
```

- For version 460.39 to 575.57:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
```

- For version 440.68 to 445.48:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
```

- For earlier versions:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

14. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

Rocky Linux 8

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install **gcc** and **make**, if they are not already installed.

```
[ec2-user ~]$ sudo yum install -y gcc make
```

2. Update your package cache and get the package updates for your instance.

```
[ec2-user ~]$ sudo yum update -y
```

3. Reboot your instance to load the latest kernel version.

```
[ec2-user ~]$ sudo reboot
```

4. Reconnect to your instance after it has rebooted.
5. Install the kernel headers package for the version of the kernel you are currently running.

```
[ec2-user ~]$ sudo dnf install -y unzip elfutils-libelf-devel libglvnd-devel
 kernel-devel-$(uname -r)
```

6. Download the gaming driver installation utility using the following command:

Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

7. Extract the gaming driver installation utility from the downloaded `.zip` archive.

```
[ec2-user ~]$ unzip *Gaming-Linux-Guest-Drivers.zip -d nvidia-drivers
```

8. Add permissions to run the driver installation utility using the following command:

```
[ec2-user ~]$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
```

9. Run the installer using the following command:

```
[ec2-user ~]$ sudo nvidia-drivers/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

10. Use the following command to create the required configuration file.

```
[ec2-user ~]$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

11. Use the following command to download and rename the certification file.

- For version 590.48 or later:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
```

- For version 575.64 to 580.105.08:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
```

- For version 460.39 to 575.57:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
```

- For version 440.68 to 445.48:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
```

- For earlier versions:

```
[ec2-user ~]$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
```

12. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
[ec2-user ~]$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
[ec2-user ~]$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /
etc/modprobe.d/nvidia.conf
```

13. Reboot the instance.

```
[ec2-user ~]$ sudo reboot
```

14. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV.

Ubuntu and Debian

To install the NVIDIA gaming driver on your instance

1. Connect to your Linux instance. Install **gcc** and **make**, if they are not already installed.

```
$ sudo apt-get install -y gcc make build-essential
```

2. Update your package cache and get the package updates for your instance.

```
$ sudo apt-get update -y
```

3. Upgrade the `linux-aws` package to receive the latest version.

```
$ sudo apt-get upgrade -y linux-aws
```

4. Reboot your instance to load the latest kernel version.

```
$ sudo reboot
```

5. Reconnect to your instance after it has rebooted.
6. Install the kernel headers package for the version of the kernel you are currently running.

```
$ sudo apt install -y unzip dkms linux-headers-$(uname -r)
```

7. Disable the nouveau open source driver for NVIDIA graphics cards.

   a. Add nouveau to the `/etc/modprobe.d/blacklist.conf` blacklist file. Copy the following code block and paste it into a terminal.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
blacklist rivatv
EOF
```

   b. Edit the `/etc/default/grub` file and add the following line:

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

   c. Rebuild the Grub configuration.

```
$ sudo update-grub
```

8. Download the gaming driver installation utility using the following command:

   Multiple versions of the gaming driver are stored in this bucket. You can see all of the available versions using the following command:

9. Extract the gaming driver installation utility from the downloaded `.zip` archive.

```
$ unzip *Gaming-Linux-Guest-Drivers.zip -d nvidia-drivers
```

10. Add permissions to run the driver installation utility using the following command:

```
$ chmod +x nvidia-drivers/NVIDIA-Linux-x86_64*-grid.run
```

11. Run the installer using the following command:

```
$ sudo nvidia-drivers/NVIDIA-Linux-x86_64*.run
```

When prompted, accept the license agreement and specify the installation options as required (you can accept the default options).

12. Use the following command to create the required configuration file.

```
$ cat << EOF | sudo tee -a /etc/nvidia/gridd.conf
vGamingMarketplace=2
EOF
```

13. Use the following command to download and rename the certification file.

- For version 590.48 or later:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert_2026_03_02.cert"
```

- For version 575.64 to 580.105.08:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2025_07_01.cert"
```

- For version 460.39 to 575.57:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCertLinux_2024_02_22.cert"
```

- For version 440.68 to 445.48:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2020_04.cert"
```

- For earlier versions:

```
$ sudo curl -o /etc/nvidia/GridSwCert.txt "https://nvidia-
gaming.s3.amazonaws.com/GridSwCert-Archive/GridSwCert-Linux_2019_09.cert"
```

14. If you are using NVIDIA driver version 510.x or greater on the G4dn, G5, or G5g instances, disable GSP with the following commands. For more information about why this is required, see the NVIDIA documentation.

```
$ sudo touch /etc/modprobe.d/nvidia.conf
```

```
$ echo "options nvidia NVreg_EnableGpuFirmware=0" | sudo tee --append /etc/
modprobe.d/nvidia.conf
```

15. Reboot the instance.

```
$ sudo reboot
```

16. (Optional) To help take advantage of a single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV. If you do not require this functionality, do not complete this step.

Windows operating systems

Before you install an NVIDIA gaming driver on your instance, you must ensure that the following prerequisites are met in addition to the considerations mentioned for all gaming drivers.

- If you launch your Windows instance using a custom Windows AMI, the AMI must be a standardized image created with Windows Sysprep to ensure that the gaming driver works. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.
- Configure default credentials for the AWS Tools for Windows PowerShell on your Windows instance. For more information, see Getting Started with the AWS Tools for Windows PowerShell in the *AWS Tools for PowerShell User Guide*.

To install the NVIDIA gaming driver on your Windows instance

1. Connect to your Windows instance and open a PowerShell window.
2. Download and install the gaming driver using the following PowerShell commands.

```
$Bucket = "nvidia-gaming"
$KeyPrefix = "windows/latest"
$LocalPath = "$home\Desktop\NVIDIA"
```

```
$Objects = Get-S3Object -BucketName $Bucket -KeyPrefix $KeyPrefix -Region eusc-de-
east-1
foreach ($Object in $Objects) {
$LocalFileName = $Object.Key
if ($LocalFileName -ne '' -and $Object.Size -ne 0) {
$LocalFilePath = Join-Path $LocalPath $LocalFileName
Copy-S3Object -BucketName $Bucket -Key $Object.Key -LocalFile $LocalFilePath -
Region eusc-de-east-1
}
}
```

Multiple versions of the NVIDIA GRID driver are stored in this S3 bucket. You can download all of the available versions in the bucket if you change the value of the `$KeyPrefix` variable from *"windows/latest"* to *"windows"*.

3. Navigate to the desktop and open the installation file to launch it (choose the driver version that corresponds to your instance OS version). Follow the instructions to install the driver and reboot your instance as required. To verify that the GPU is working properly, check Device Manager.
4. Use one of the following methods to register the driver.

   Version 527.27 or above

   Create the following registry key with the 64-bit version of PowerShell, or the Command Prompt window.

   key: `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global`

   name: vGamingMarketplace

   type: DWord

   value: 2

   PowerShell

   Run the following PowerShell command to create this registry value. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

```
New-ItemProperty -Path "HKLM:\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global"
 -Name "vGamingMarketplace" -PropertyType "DWord" -Value "2"
```

Command Prompt

Run the following registry command to create this registry value. You can run it using the Command Prompt window or a 64-bit version of PowerShell.

```
reg add "HKLM\SYSTEM\CurrentControlSet\Services\nvlddmkm\Global" /v
 vGamingMarketplace /t REG_DWORD /d 2
```

Earlier versions

Create the following registry key with the 64-bit version of PowerShell, or the Command Prompt window.

key: `HKEY_LOCAL_MACHINE\SOFTWARE\NVIDIA Corporation\Global`

name: vGamingMarketplace

type: DWord

value: 2

PowerShell

Run the following PowerShell command to create this registry value. The AWS Tools for PowerShell in AWS Windows AMIs defaults to the 32-bit version and this command fails. Instead, use the 64-bit version of PowerShell included with the operating system.

```
New-ItemProperty -Path "HKLM:\SOFTWARE\NVIDIA Corporation\Global" -Name
 "vGamingMarketplace" -PropertyType "DWord" -Value "2"
```

Command Prompt

Run the following registry command to create this registry key with the Command Prompt window. You can also use this command in the 64-bit version of PowerShell.

```
reg add "HKLM\SOFTWARE\NVIDIA Corporation\Global" /v vGamingMarketplace /t
 REG_DWORD /d 2
```

5. Run the following command in PowerShell. This downloads the certification file, renames the file `GridSwCert.txt`, and moves the file to the Public Documents folder on your system drive. Typically, the folder path is `C:\Users\Public\Documents`.

   - For version 591.59 or later:

     ```
     Invoke-WebRequest -Uri "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-
     Archive/GridSwCert_2026_03_02.cert" -OutFile "$Env:PUBLIC\Documents
     \GridSwCert.txt"
     ```

   - For version 576.80 to 581.80:

     ```
     Invoke-WebRequest -Uri "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-
     Archive/GridSwCertWindows_2025_07_01.cert" -OutFile "$Env:PUBLIC\Documents
     \GridSwCert.txt"
     ```

   - For version 460.39 to 576.72:

     ```
     Invoke-WebRequest -Uri "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-
     Archive/GridSwCertWindows_2024_02_22.cert" -OutFile "$Env:PUBLIC\Documents
     \GridSwCert.txt"
     ```

   - For version 445.87:

     ```
     Invoke-WebRequest -Uri "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-
     Archive/GridSwCert-Windows_2020_04.cert" -OutFile "$Env:PUBLIC\Documents
     \GridSwCert.txt"
     ```

   - For earlier versions:

     ```
     Invoke-WebRequest -Uri "https://nvidia-gaming.s3.amazonaws.com/GridSwCert-
     Archive/GridSwCert-Windows_2019_09.cert" -OutFile "$Env:PUBLIC\Documents
     \GridSwCert.txt"
     ```

   If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```
[Net.ServicePointManager]::SecurityProtocol = [Net.SecurityProtocolType]::Tls12
```

6. Reboot your instance.
7. Locate the `nvidia-smi.exe` file on the instance.

   ```
   Get-ChildItem -Path C:\ -Recurse -Filter "nvidia-smi.exe"
   ```

   Verify the NVIDIA Gaming license using the following command. Replace *path* with the name of the folder in the output from the previous command.

   ```
   C:\Windows\System32\DriverStore\FileRepository\path\nvidia-smi.exe -q
   ```

   The output should be similar to the following.

   ```
   vGPU Software Licensed Product
   Product Name                : NVIDIA Cloud Gaming
   License Status              : Licensed (Expiry: N/A)
   ```

8. (Optional) To help take advantage of the single display of up to 4K resolution, set up the high-performance display protocol Amazon DCV. If you do not require this functionality, do not complete this step.

Install the ENA driver on EC2 Windows instances

If your instance isn't based on one of the latest Windows Amazon Machine Images (AMIs) that Amazon provides, use the following procedure to install the current ENA driver on your instance. You should perform this update at a time when it's convenient to reboot your instance. If the install script doesn't automatically reboot your instance, we recommend that you reboot the instance as the final step.

If you use an instance store volume to store data while the instance is running, that data is erased when you stop the instance. Before you stop your instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

Prerequisites

To install or upgrade the ENA driver, your Windows instance must meet the following prerequisites:

- PowerShell version 3.0 or later is installed.
- The commands shown in this section must run in the 64-bit version of PowerShell. Do not use the x86 version of PowerShell. That is the 32-bit version of the shell, and is not supported for these commands.

Step 1: Back up your data

We recommend that you create a backup AMI, in case you're not able to roll back your changes through the **Device Manager**. To create a backup AMI with the AWS Management Console, follow these steps:

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that requires the driver upgrade, and choose **Stop instance** from the **Instance state** menu.
4. After the instance is stopped, select the instance again. To create your backup, choose **Image and templates** from the **Actions** menu, then choose **Create image**.
5. To restart your instance, choose **Start instance** from the **Instance state** menu.

Step 2: Install or upgrade your ENA driver

You can install or upgrade your ENA driver with AWS Systems Manager Distributor, or with PowerShell cmdlets. For further instructions, select the tab that matches the method that you want to use.

Systems Manager Distributor

You can use the Systems Manager Distributor feature to deploy packages to your Systems Manager managed nodes. With Systems Manager Distributor, you can install the ENA driver package once, or with scheduled updates. For more information about how to install the ENA driver package (`AwsEnaNetworkDriver`) with Systems Manager Distributor, see Install or update packages in the *AWS Systems Manager User Guide*.

PowerShell

This section covers how to download and install ENA driver packages on your instance with PowerShell cmdlets.

Option 1: Download and extract the latest version

1. Connect to your instance and log in as the local administrator.
2. Use the **invoke-webrequest** cmdlet to download the latest driver package:

```
PS C:\> invoke-webrequest https://ec2-windows-drivers-
downloads.s3.amazonaws.com/ENA/Latest/AwsEnaNetworkDriver.zip -
outfile $env:USERPROFILE\AwsEnaNetworkDriver.zip
```

> **Note**
>
> If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:
>
> ```
> [Net.ServicePointManager]::SecurityProtocol =
>  [Net.SecurityProtocolType]::Tls12
> ```
>
> Alternatively, you can download the latest driver package from a browser window on your instance.

3. Use the **expand-archive** cmdlet to extract the zip archive that you downloaded to your instance:

```
PS C:\> expand-archive $env:userprofile\AwsEnaNetworkDriver.zip -
DestinationPath $env:userprofile\AwsEnaNetworkDriver
```

Option 2: Download and extract a specific version

1. Connect to your instance and log in as the local administrator.
2. Download the ENA driver package for the specific version you want from the version link in the ENA Windows driver version history table.
3. Extract the zip archive to your instance.

Install the ENA driver with PowerShell

The install steps are the same whether you've downloaded the latest driver or a specific version. To install the ENA driver, follow these steps.

1. To install the driver, run the `install.ps1` PowerShell script from the `AwsEnaNetworkDriver` directory on your instance. If you get an error, make sure that you're using PowerShell 3.0 or later.
2. If the installer doesn't automatically reboot your instance, run the **Restart-Computer** PowerShell cmdlet.

```
PS C:\> Restart-Computer
```

Step 3 (optional): Verify the ENA driver version after installation

To ensure that the ENA driver package was successfully installed on your instance, you can verify the new version as follows:

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

> **Note**
>
> ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To verify the current version that's installed, open the **Driver** tab and check the **Driver Version**. If the current version doesn't match your target version, see Troubleshoot the Elastic Network Adapter Windows driver.

Roll back an ENA driver installation

If anything goes wrong with the installation, you might need to roll back the driver. Follow these steps to roll back to the previous version of the ENA driver that was installed on your instance.

1. Connect to your instance and log in as the local administrator.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.

   > **Note**
   >
   > ENA adapters all use the same driver. If you have multiple ENA adapters, you can select any one of them to update the driver for all of the ENA adapters.

6. To roll back the driver, open the **Driver** tab and choose **Roll Back Driver**. This opens the **Driver Package rollback** window.

   > **Note**
   >
   > If the **Driver** tab doesn't show the **Roll Back Driver** action, or if the action is unavailable, it means that the Driver Store on your instance doesn't contain the previously installed driver package. To troubleshoot this issue, see Troubleshooting scenarios, and expand the **Unexpected ENA driver version installed** section. For more information about the device driver package selection process, see How Windows selects a driver package for a device on the *Microsoft documentation website*.

Track ENA Windows driver version releases

Windows AMIs include the ENA Windows driver to enable enhanced networking.

For Windows Server versions 2016 and above, we recommend that you use the latest driver version. For earlier versions of Windows Server, refer to the following table to determine which ENA driver version to use.

Windows Server version	ENA driver version
Windows Server 2012 R2	2.6.0 and earlier

Windows Server version	ENA driver version
Windows Server 2012	2.6.0 and earlier
Windows Server 2008 R2	2.2.3 and earlier

ENA Windows driver version history

The following table summarizes the changes for each release.

Driver version	Details	Release date
	New features • Added support for dynamic queue allocation with scaling up to 64 I/O queues, subject to instance type limits. **Bug fixes** • Fixed missing handling of error conditions when retrieving the physical DMA address width from the device.	August 1, 2025
	Bug fixes • Fixed improper handling of memory allocation failures during queue initialization to prevent unexpected reboots. • Fixed possible misconfiguration of network offloads where device capabilities were ignored.	June 24, 2025

Driver version	Details	Release date
	New features • Added support for asynchronous reset requests initiated by the device. • Added support for handling the maximum large LLQ depth value provided by the device. • Added Event ID 58001 in the Windows Event Viewer to enhance visibility into unexpected power state transitions caused by device misconfiguration. **Bug fixes** • Fixed improper handling of memory allocation failures during device initialization to prevent unexpected reboots. • Fixed an issue in the interrupt service routine that could enqueue a DPC during device stop, preventing unexpected reboots.	December 12, 2024
	Bug fixes • Fixed a race condition in the complete flow of egress network buffer list (NBL) processing, which could lead to memory corruption caused by attempting to release an NBL that was already released. • Fixed misdetection of L3 protocol when disabling all LSO and checksum offloads that could lead to unexpected behavior.	September 30, 2024

Driver version	Details	Release date
	New features • Removed support for Windows Server 2012 (Windows 8) and Windows Server 2012 R2 (Windows 8.1). These operating system versions have reached the end of support from AWS. Driver install will fail on Windows Server 2012 and earlier. • Added support for offloading IPv6 Tx checksum calculation to the device. • Added wide Low Latency Queuing (LLQ) support. This is dynamically enabled based on device recommend ation. You can override this setting with the new "WideLLQ" registry key. • Added reporting for packet drops resulting from Rx overrun, which indicates insufficient space in the Rx ring for incoming packets. • Added support for suboptimal configuration notificat ions from the device. See event ID `59000` in the Windows event viewer. **Bug fixes** • Avoid unnecessary device reset caused by Tx packets with headers that exceed the maximum Low Latency Queuing (LLQ) header size.	May 1, 2024

Driver version	Details	Release date
	New features • Adds the following network performance metrics for instance types that support ENA Express. • `ena_srd_mode` • `ena_srd_tx_pkts` • `ena_srd_eligible_tx_pkts` • `ena_srd_rx_pkts` • `ena_srd_resource_utilization` • Adds `conntrack_allowance_available` network performance metric for Nitro based instance types. • Adds new adapter reset reason due to detection of RX data corruption. • Updates driver logging infrastructure. **Bug fixes** • Prevents adapter reset in the event that CPU starvation causes a network performance metrics update to fail. • Prevents false detection of an interruption to the device heartbeat. •	June 20, 2023

Driver version	Details	Release date
	Fixes driver installation script to support downgrade operation. • Fixes the receive error count statistic.	
2.5.0	**Announcement** ENA Windows driver version 2.5.0 has been rolled back due to failure to initialize on the Windows domain controller. Windows Client and Windows Server are unaffected.	February 17, 2023

Driver version	Details	Release date
	New features • Adds support for Windows Server 2022. • Removes support for Windows Server 2008 R2. • Sets Low Latency Queuing (LLQ) to always on to improve performance on sixth generation Amazon EC2 instances. **Bug fixes** • Fixes a failure to publish network performance metrics to the Performance Counters for Windows (PCW) system. • Fixes a memory leak during the registry key reading operation. • Prevents an infinite reset loop in the event of an unrecoverable error during the adapter reset process.	April 28, 2022

Driver version	Details	Release date
2.2.4	**Announcement** ENA Windows driver version 2.2.4 has been rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you downgrade the driver, using one of the following methods: • **Install the previous version** 1. Download the previous version package from the link in this table (version 2.2.3). 2. Run the **install.ps1** PowerShell installation script. For more details for pre- and post-installation steps see Enable enhanced networking on Windows. • **Use Amazon EC2 Systems Manager for a bulk update** • Perform a bulk update via SSM document `AWS-ConfigureAWSPackage` , with the following parameters: • **Name**: AwsEnaNetworkDriver • **Version**: 2.2.3	October 26, 2021

Driver version	Details	Release date
	New features • Adds support for new Nitro cards with up to 400 Gbps instance networking. **Bug fixes** • Fixes race condition between system time change and system time query by the ENA driver, which causes false-positive detection of HW unresponsiveness. **Announcement** Windows ENA driver version 2.2.3 is the final version that supports Windows Server 2008 R2. Currently available instance types that use ENA will continue to be supported on Windows Server 2008 R2, and the drivers are available by download. No future instance types will support Windows Server 2008 R2, and you cannot launch, import, or migrate Windows Server 2008 R2 images to future instance types.	March 25, 2021

Driver version	Details	Release date
	New features • Adds support to query network adapter performance metrics with CloudWatch and the Performance Counters for Windows consumers. **Bug fixes** • Fixes performance issues on bare metal instances.	December 21, 2020
	New features • Adds a method to allow the host to query the Elastic Network Adapter for network performance metrics.	October 1, 2020

Driver version	Details	Release date
	New features • Adds support for next generation hardware types. • Improves instance start time after resuming from st op-hibernate, and eliminates false positive ENA error messages. **Performance optimizations** • Optimizes processing of inbound traffic. • Improves shared memory management in low resource environment. **Bug fixes** • Avoids system crash upon ENA device removal in rare scenario where driver fails to reset.	August 12, 2020
	Bug fixes • Fixes occasional network adapter initialization failure on bare metal instances.	June 23, 2020

Driver version	Details	Release date
	Bug fixes • Prevent connectivity issues caused by corrupted LSO packet metadata arriving from the network stack. • Prevent system crash caused by a rare race condition that results in accessing an already released packet memory.	November 25, 2019
	New features • Added support for vendor ID report to allow OS to generate MAC-based UUIDs. **Bug fixes** • Improved DHCP network configuration performance during initialization. • Properly calculate L4 checksum on inbound IPv6 traffic when the maximum transmission unit (MTU) exceeds 4K. • General improvements to driver stability and minor bug fixes.	November 4, 2019

Driver version	Details	Release date
	Bug fixes • Prevent drops of highly fragmented TCP LSO packets arriving from operating system. • Properly handle Encapsulating Security Payload (ESP) protocol within the IPSec in IPv6 networks.	September 16, 2019

Driver version	Details	Release date
	ENA Windows driver v2.1 introduces new ENA device capabilities, provides a performance boost, adds new features, and includes multiple stability improvements. **New features** • Use standardized Windows registry key for Jumbo frames configuration. • Allow VLAN ID setting through the ENA driver properties GUI. • Improved Recovery flows • Improved failure identification mechanism. • Added support for tunable recovery parameters. • Support up to 32 I/O queues for newer EC2 instances that have more than 8 vCPUs. • ~90% reduction of driver memory footprint. **Performance optimizations** • Reduced transmit path latency. • Support for receive checksum offload. • Performance optimization for heavily loaded system (optimized usage of locking mechanisms). • Further enhancements to reduce CPU utilization and improve system responsiveness under load.	July 1, 2019

Driver version	Details	Release date
	Bug fixes • Fix crash due to invalid parsing of non-contiguous Tx headers. • Fix driver v1.5 crash during the elastic network inte rface detach on Bare Metal instances. • Fix LSO pseudo-header checksum calculation error over IPv6. • Fix potential memory resource leak upon initialization failure. • Disable TCP/UDP checksum offload for IPv4 fragments. • Fix for VLAN configuration. VLAN was incorrectly disabled when only VLAN priority should have been disabled. • Enable correct parsing of custom driver messages by the event viewer. • Fix failure to initialize driver due to invalid timestamp handling. • Fix race condition between data processing and ENA device disabling.	

Driver version	Details	Release date
	Updates • Improved stability and performance fixes. • Receive Buffers can now be configured up to a value of 8192 in Advanced Properties of the ENA NIC. • Default Receive Buffers of 1k.	October 4, 2018
	Includes reliability fixes and unifies support for Windows Server 2008 R2 through Windows Server 2016.	February 13, 2018
	The initial release. Included in AMIs for Windows Server 2008 R2, Windows Server 2012 RTM, Windows Server 2012 R2, and Windows Server 2016.	July 2016

Subscribe to ENA Windows driver release notifications from Amazon SNS

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

Subscribe to EC2 notifications

1. Open the Amazon SNS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/sns/v3/home.
2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:
    a. For **TopicARN**, copy the following Amazon Resource Name (ARN):

arn:aws-eusc:sns:us-east-1:801119661308:ec2-windows-drivers

b. For **Protocol**, choose `Email`.

c. For **Endpoint**, enter an email address where you want notifications sent.

d. Choose **Create subscription**.

6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

Unsubscribe from Amazon EC2 Windows driver notification

1. Open the Amazon SNS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/sns/v3/home.
2. In the navigation pane, choose **Subscriptions**.
3. Select the checkbox for the subscription and then choose **Actions**, **Delete subscriptions**. When prompted for confirmation, choose **Delete**.

Paravirtual drivers for Windows instances

Windows AMIs contain a set of drivers to permit access to virtualized hardware. These drivers are used by Amazon EC2 to map instance store and Amazon EBS volumes to their devices. The following table shows key differences between the different drivers.

	Red Hat PV	Citrix PV	AWS PV
Instance type	Not supported for all instance types. If you specify an unsupported instance type, the instance is impaired.	Supported for Xen instance types.	Supported for Xen instance types.
Attached volumes	Supports up to 16 attached volumes.	Supports more than 16 attached volumes.	Supports more than 16 attached volumes.

	Red Hat PV	Citrix PV	AWS PV
Network	The driver has known issues where the network connection resets under high loads; for example, fast FTP file transfers.		The driver automatically configures jumbo frames on the network adapter when on a compatible instance type. When the instance is in a cluster placement group, this offers better network performance between instances that are in the cluster placement group. For more information, see Placement groups for your Amazon EC2 instances.

The following table shows which PV drivers you should run on each version of Windows Server on Amazon EC2.

Windows Server version	PV driver version
Windows Server 2025	Not supported
Windows Server 2022	AWS PV latest version
Windows Server 2019	AWS PV latest version
Windows Server 2016	AWS PV latest version
Windows Server 2012 R2	AWS PV version 8.4.3
Windows Server 2012	AWS PV version 8.4.3
Windows Server 2008 R2	AWS PV version 8.3.5
Windows Server 2008	Citrix PV 5.9
Windows Server 2003	Citrix PV 5.9

Contents

- AWS PV drivers
- Citrix PV drivers
- Red Hat PV drivers
- Upgrade PV drivers on EC2 Windows instances
- Troubleshoot PV drivers on Windows instances

AWS PV drivers

The AWS PV drivers are stored in the `%ProgramFiles%\Amazon\Xentools` directory. This directory also contains public symbols and a command line tool, `xenstore_client.exe`, that enables you to access entries in XenStore. For example, the following PowerShell command returns the current time from the Hypervisor:

```
PS C:\> [DateTime]::FromFileTimeUTC((gwmi -n root\wmi -cl
 AWSXenStoreBase).XenTime).ToString("hh:mm:ss")
11:17:00
```

The AWS PV driver components are listed in the Windows registry under `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services`. These driver components are as follows: xenbus, xeniface, xennet, xenvbd, and xenvif.

AWS PV drivers also have a Windows service named LiteAgent, which runs in user-mode. It handles tasks such as shutdown and restart events from AWS APIs on Xen generation instances. You can access and manage services by running `Services.msc` from the command line. When running on Nitro generation instances, the AWS PV drivers are not used and the LiteAgent service will self-stop starting with driver version 8.2.4. Updating to the latest AWS PV driver also updates the LiteAgent and improves reliability on all instance generations.

Install the latest AWS PV drivers

Amazon Windows AMIs contain a set of drivers to permit access to virtualized hardware. These drivers are used by Amazon EC2 to map instance store and Amazon EBS volumes to their devices. We recommend that you install the latest drivers to improve stability and performance of your EC2 Windows instances.

Installation options

- Use AWS Systems Manager to automatically update the PV drivers. For more information, see Walkthrough: Automatically Update PV Drivers on EC2 Windows Instances in the *AWS Systems Manager User Guide*.
- the driver package and run the install program manually. For information about downloading and installing the AWS PV drivers, or upgrading a domain controller, see Upgrade Windows Server instances (AWS PV upgrade) manually.

For system requirements for installing the AWS PV driver package, see System requirements for the AWS PV driver package.

AWS PV driver package history

The following table shows the changes to AWS PV drivers for each driver release.

Package version	Details	Release date
	• Updated runtime dependencies in the installer package.	July 21, 2026
8.6.0	• Stability fixes to XenStore interactions.	May 27, 2025
8.5.0	• Stability fixes to address rare cases of crashes during network device detachment. • Stability fixes to address rare cases of crashes during EBS volume detachment. • Fixed bugs in the package installer. • Updated the PV installer to use `Pnputil`.	October 31, 2024
	Fixed bugs in the package installer to improve the upgrade experience. This is the last version that can run on Windows Server 2012 and 2012 R2. This version is available for download, however it is no longer supported since Windows Server 2012 and 2012 R2 have reached end of support.	January 24, 2023
8.4.2	Stability fixes to address race condition.	April 13, 2022
8.4.1	Improved package installer.	January 7, 2022
8.4.0	• Stability fixes to address rare cases of stuck disk IO. • Stability fixes to address rare cases of crashes during EBS volume detachment. • Added feature to distribute load across multiple cores for workloads that leverage more than 20,000 IOPS and experience degradation due to bottlenecks. To enable this feature, see Workloads that leverage more than 20,000 disk IOPS experience degradation due to CPU bottlenecks.	March 2, 2021
	Improved package installer.	January 7, 2022

Package version	Details	Release date
	This is the last version that can run on Windows Server 2008 R2. This version is available for download but no longer supported. Windows Server 2008 R2 has reached end-of-life, and is no longer supported by Microsoft.	
8.3.4	Improved reliability of network device attachment.	August 4, 2020
8.3.3	• Update to XenStore-facing component to prevent bug check during error-handling paths. • Update to storage component to avoid crashes when an invalid SRB is submitted. To update this driver on Windows Server 2008 R2 instances, you must first verify that the appropriate patches are installed to address the following Microsoft Security Advisory: Microsoft Security Advisory 3033929.	February 4, 2020
8.3.2	Enhanced reliability of networking components.	July 30, 2019
8.3.1	Improved performance and robustness of storage component.	June 12, 2019
8.2.7	Improved efficiency to support migrating to latest generation instance types.	May 20, 2019
8.2.6	Improved efficiency of crash dump path.	January 15, 2019
8.2.5	Additional security enhancements. PowerShell installer now available in package.	December 12, 2018
8.2.4	Reliability improvements.	October 2, 2018

Package version	Details	Release date
8.2.3	Bug fixes and performance improvements. Report EBS volume ID as disk serial number for EBS volumes. This enables cluster scenarios such as S2D.	May 29, 2018
8.2.1	Network and storage performance improvements plus multiple robustness fixes. To verify that this version has been installed, refer to the following Windows registry value: `HKLM\Software\Amazon\PVDriver\Version 8.2.1` .	March 8, 2018
7.4.3	Added support for Windows Server 2016. Stability fixes for all supported Windows OS versions. *AWS PV driver version 7.4.3's signature expires on March 29, 2019. We recommend updating to the latest AWS PV driver.	November 18, 2016
7.4.2	Stability fixes for support of X1 instance type.	August 2, 2016
7.4.1	• Performance improvement in AWS PV Storage driver. • Stability fixes in AWS PV Storage driver: Fixed an issue where the instances were hitting a system crash with bug check code 0x0000DEAD. • Stability fixes in AWS PV Network driver. • Added support for Windows Server 2008R2.	July 12, 2016
7.3.2	• Improved logging and diagnostics. • Stability fix in AWS PV Storage driver. In some cases disks may not surface in Windows after reattaching the disk to the instance. • Added support for Windows Server 2012.	June 24, 2015

Package version	Details	Release date
7.3.1	TRIM update: Fix related to TRIM requests. This fix stabilizes instances and improves instance performance when managing large numbers of TRIM requests.	
7.3.0	TRIM support: The AWS PV driver now sends TRIM requests to the hypervisor. Ephemeral disks will properly process TRIM requests given the underlying storage supports TRIM (SSD). Note that EBS-based storage does not support TRIM as of March 2015.	
7.2.5	• Stability fix in AWS PV Storage drivers: In some cases the AWS PV driver could dereference invalid memory and cause a system failure. • Stability fix while generating a crash dump: In some cases the AWS PV driver could get stuck in a race condition when writing a crash dump. Before this release, the issue could only be resolved by forcing the driver to stop and restart which lost the memory dump.	
7.2.4	Device ID persistence: This driver fix masks the platform PCI device ID and forces the system to always surface the same device ID, even if the instance is moved. More generally, the fix affects how the hypervisor surfaces virtual devices. The fix also includes modifications to the co-installer for the AWS PV drivers so the system persists mapped virtual devices.	
7.2.2	• Load the AWS PV drivers in Directory Services Restore Mode (DSRM) mode: Directory Services Restore Mode is a safe mode boot option for Windows Server domain controllers. • Persist device ID when virtual network adapter device is reattached: This fix forces the system to check the MAC address mapping and persist the device ID. This fix ensures that adapters retain their static settings if the adapters are reattached.	

Package version	Details	Release date
7.2.1	• Run in safe mode: Fixed an issue where the driver would not load in safe mode. Previously the AWS PV Drivers would only instantiate in normal running systems. • Add disks to Microsoft Windows Storage Pools: Previously we synthesized page 83 queries. The fix disabled page 83 support. Note this does not affect storage pools that are used in a cluster environment because PV disks are not valid cluster disks.	
7.2.0	Base: The AWS PV base version.	

Citrix PV drivers

The Citrix PV drivers are stored in the `%ProgramFiles%\Citrix\XenTools` (32-bit instances) or `%ProgramFiles(x86)%\Citrix\XenTools` (64-bit instances) directory.

The Citrix PV driver components are listed in the Windows registry under `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\services`. These driver components are as follows: xenevtchn, xeniface, xennet, Xennet6, xensvc, xenvbd, and xenvif.

Citrix also has a driver component named XenGuestAgent, which runs as a Windows service. It handles tasks such as shutdown and restart events from the API. You can access and manage services by running `Services.msc` from the command line.

If you are encountering networking errors while performing certain workloads, you may need to disable the TCP offloading feature for the Citrix PV driver. For more information, see TCP offloading.

Red Hat PV drivers

Red Hat drivers are supported for legacy instances, but are not recommended on newer instances with more than 12GB of RAM due to driver limitations. Instances with more than 12GB of RAM running Red Hat drivers can fail to boot and become inaccessible. We recommend upgrading Red Hat drivers to Citrix PV drivers, and then upgrade Citrix PV drivers to AWS PV drivers.

The source files for the Red Hat drivers are in the `%ProgramFiles%\RedHat` (32-bit instances) or `%ProgramFiles(x86)%\RedHat` (64-bit instances) directory. The two drivers are `rhelnet`, the Red Hat Paravirtualized network driver, and `rhelscsi`, the Red Hat SCSI miniport driver.

Upgrade PV drivers on EC2 Windows instances

We recommend that you install the latest PV drivers to improve the stability and performance of your EC2 Windows instances. The directions on this page help you download the driver package and run the install program.

To verify which driver your Windows instance uses

Open **Device Manager** and view **Network Adapters**. Check whether the PV driver is one of the following:

- AWS PV Network Device
- Citrix PV Ethernet Adapter
- Red Hat PV NIC Driver

Contents

- System requirements for the AWS PV driver package
- Upgrade Windows Server instances (AWS PV upgrade) with Distributor
- Upgrade Windows Server instances (AWS PV upgrade) manually
- Upgrade a domain controller (AWS PV upgrade)
- Upgrade Windows Server 2008 and 2008 R2 instances (Red Hat to Citrix PV upgrade)
- Upgrade your Citrix Xen guest agent service

System requirements for the AWS PV driver package

The following requirements apply to the AWS PV driver package whether you install it through Systems Manager or manually.

- A version of Windows Server that the package version supports. Older versions of Windows Server require an earlier package version. For the package version to use with your operating system, see Paravirtual drivers for Windows instances.
- The minimum .NET Framework version required by the package installer, as the following table shows.

AWS PV driver package version	Minimum .NET Framework version
Latest	4.7.2
8.4.3	4.5
8.3.5	4.5

Upgrade Windows Server instances (AWS PV upgrade) with Distributor

You can use Distributor, a capability of AWS Systems Manager, to install or upgrade the AWS PV driver package. The installation or upgrade can be performed one time, or you can install or update it on a schedule. The `In-place update` option for **Installation Type** isn't supported for this Distributor package.

> **Important**
>
> If your instance is a domain controller, see Upgrade a domain controller (AWS PV upgrade). The upgrade process for domain controller instances is different than standard editions of Windows.

1. We recommend that you create a backup in case you need to roll back your changes.

   > **Tip**
   >
   > Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the `AWS-CreateImage` runbook. For more information, see AWS-CreateImage in the *AWS Systems Manager Automation runbook reference User Guide*.

   a. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

   b. In the navigation pane, choose **Instances**.

c. Select the instance that requires the driver upgrade, and choose **Instance state**, **Stop instance**.

d. After the instance is stopped, select the instance, choose **Actions**, then **Image and templates**, and then choose **Create image**.

e. Choose **Instance state**, **Start instance**.

2. Connect to the instance using Remote Desktop. For more information, see the section called "Connect using an RDP client".
3. We recommend that you take all non-system disks offline and note any drive letter mappings to the secondary disks in Disk Management before you perform this upgrade. This step is not required if you are performing an in-place update of AWS PV drivers. We also recommend setting non-essential services to **Manual** start-up in the Services console.
4. For the instructions for how to install or upgrade the AWS PV driver package using Distributor, see the procedures in Install or update packages in the *AWS Systems Manager User Guide*.
5. For **Name**, choose **AWSPVDriver**.
6. For **Installation type**, select **Uninstall and reinstall**.
7. Configure the other parameters for the package as necessary and run installation or upgrade using the referenced procedure in Step 4.

   After running the Distributor package, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes.
8. After the upgrade is complete, and the instance passes both health checks in the Amazon EC2 console, verify that the new driver was installed by connecting to the instance using Remote Desktop.
9. After you are connected, run the following PowerShell command:

   ```
   Get-ItemProperty HKLM:\SOFTWARE\Amazon\PVDriver
   ```
10. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters noted in Step 3.

If you previously disabled TCP offloading using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV drivers. TCP Offloading issues with Citrix drivers

are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.

If you previously applied a static IP address or DNS configuration to the network interface, you might need to reapply the static IP address or DNS configuration after upgrading AWS PV drivers.

Upgrade Windows Server instances (AWS PV upgrade) manually

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, Windows Server 2019, or Windows Server 2022. This upgrade is not available for Red Hat drivers, or for other versions of Windows Server.

> **Important**
>
> If your instance is a domain controller, see Upgrade a domain controller (AWS PV upgrade). The upgrade process for domain controller instances is different than standard editions of Windows.

To upgrade AWS PV drivers manually

1. We recommend that you create a backup in case you need to roll back your changes.

   > **Tip**
   >
   > Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the `AWS-CreateImage` runbook. For more information, see AWS-CreateImage in the *AWS Systems Manager Automation runbook reference User Guide*.

   a. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

   b. In the navigation pane, choose **Instances**.

   c. Select the instance that requires the driver upgrade, and choose **Instance state**, **Stop instance**.

d. After the instance is stopped, select the instance, choose **Actions**, then **Image and templates**, and then choose **Create image**.

e. Choose **Instance state**, **Start instance**.

2. Connect to the instance using Remote Desktop.
3. We recommend that you take all non-system disks offline and note any drive letter mappings to the secondary disks in Disk Management before you perform this upgrade. This step is not required if you are performing an in-place update of AWS PV drivers. We also recommend setting non-essential services to **Manual** start-up in the Services console.
4. Download the drivers to your instance using one of the following options:
   - **Browser** – the latest driver package to the instance and extract the zip archive.
   - **PowerShell** – Run the following commands:

     If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

     ```
     [Net.ServicePointManager]::SecurityProtocol = [Net.SecurityProtocolType]::Tls12
     ```
5. Run `AWSPVDriverSetup.msi`.

After running the MSI, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, you can verify that the new driver was installed by connecting to the instance using Remote Desktop and then running the following PowerShell command:

```
Get-ItemProperty HKLM:\SOFTWARE\Amazon\PVDriver
```

Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters noted in Step 3.

If you previously disabled TCP offloading using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV drivers. TCP Offloading issues with Citrix drivers

are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.

If you previously applied a static IP address or DNS configuration to the network interface, you might need to reapply the static IP address or DNS configuration after upgrading AWS PV drivers.

Upgrade a domain controller (AWS PV upgrade)

Use the following procedure on a domain controller to perform either an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers. To ensure that your FSMO roles remain operational during the upgrade, we recommend that you transfer those roles to other domain controllers before you start the upgrade. For more information, see How to view and transfer FSMO roles on the *Microsoft Learn* website.

To upgrade a domain controller

1. We recommend that you create a backup of your domain controller in case you need to roll back your changes. Using an AMI as a backup is not supported. For more information, see Backup and restore considerations in the Microsoft documentation.
2. Run the following command to configure Windows to boot into Directory Services Restore Mode (DSRM).

   > **Warning**
   >
   > Before running this command, confirm that you know the DSRM password. You'll need this information so that you can log in to your instance after the upgrade is complete and the instance automatically reboots.

   ```
   bcdedit /set {default} safeboot dsrepair
   ```

   PowerShell:

   ```
   PS C:\> bcdedit /set "{default}" safeboot dsrepair
   ```

   The system must boot into DSRM because the upgrade utility removes Citrix PV storage drivers so it can install AWS PV drivers. Therefore we recommend noting any drive letter and folder mappings to the secondary disks in Disk Management. When Citrix PV storage drivers are not

present, secondary drives are not detected. Domain controllers that use an NTDS folder on secondary drives will not boot because the secondary disk is not detected.

> **Warning**
>
> After you run this command do not manually reboot the system. The system will be unreachable because Citrix PV drivers do not support DSRM.

3. Run the following command to add **`DisableDCCheck`** to the registry:

```
reg add HKLM\SOFTWARE\Wow6432Node\Amazon\AWSPVDriverSetup /v DisableDCCheck /t
 REG_SZ /d true
```

4. the latest driver package to the instance and extract the zip archive.
5. Run `AWSPVDriverSetup.msi`.

   After running the MSI, the instance automatically reboots and then upgrades the driver. The instance will not be available for up to 15 minutes.
6. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop. Open Disk Management to review any offline secondary volumes and bring them online corresponding to the drive letters and folder mappings noted earlier.

   You must connect to the instance by specifying the username in the following format *hostname*\administrator. For example, Win2k12TestBox\administrator.
7. Run the following command to remove the DSRM boot configuration:

```
bcdedit /deletevalue safeboot
```

8. Reboot the instance.
9. To complete the upgrade process, verify that the new driver was installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.
10. Run the following command to delete **`DisableDCCheck`** from the registry:

```
reg delete HKLM\SOFTWARE\Wow6432Node\Amazon\AWSPVDriverSetup /v DisableDCCheck
```

> **Note**
>
> If you previously disabled TCP offloading using Netsh for Citrix PV drivers we recommend that you re-enable this feature after upgrading to AWS PV Drivers. TCP Offloading issues with Citrix drivers are not present in the AWS PV drivers. As a result, TCP Offloading provides better performance with AWS PV drivers.

Upgrade Windows Server 2008 and 2008 R2 instances (Red Hat to Citrix PV upgrade)

Before you start upgrading your Red Hat drivers to Citrix PV drivers, make sure you do the following:

- Install the latest version of the EC2Config service. For more information, see Install the latest version of EC2Config.
- Verify that you have Windows PowerShell 3.0 installed. To verify the version that you have installed, run the following command in a PowerShell window:

  ```
  PS C:\> $PSVersionTable.PSVersion
  ```

  Windows PowerShell 3.0 is bundled in the Windows Management Framework (WMF) version 3.0 install package. If you need to install Windows PowerShell 3.0, see Windows Management Framework 3.0 in the Microsoft Download Center.
- Back up your important information on the instance, or create an AMI from the instance. For more information about creating an AMI, see Create an Amazon EBS-backed AMI.

  > **Tip**
  >
  > Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the `AWS-CreateImage` runbook. For more information, see AWS-CreateImage in the *AWS Systems Manager Automation runbook reference User Guide*.

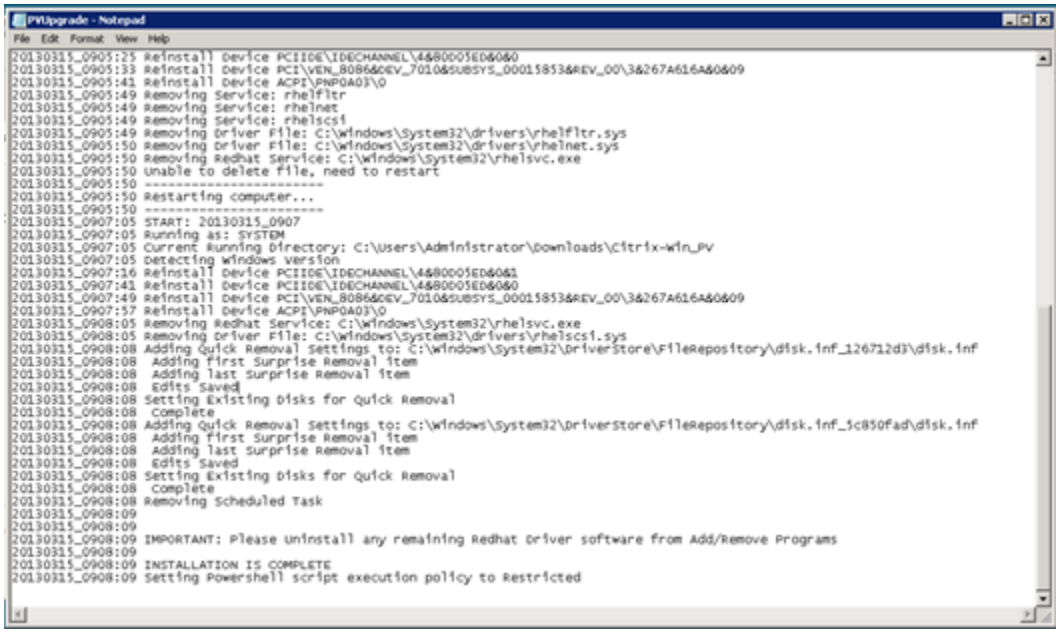
  If you create an AMI, make sure that you do the following:

  - Write down your password.
  - Do not run the Sysprep tool manually or using the EC2Config service.

- Set your Ethernet adapter to obtain an IP address automatically using DHCP.

To upgrade Red Hat drivers

1. Connect to your instance and log in as the local administrator. For more information about connecting to your instance, see Connect to your Windows instance using RDP.
2.
3. Extract the contents of the upgrade package to a location of your choice.
4. Open the **Upgrade.bat** file. If you get a security warning, choose **Run**.
5. In the **Upgrade Drivers** dialog box, review the information and choose **Yes** if you are ready to start the upgrade.
6. In the **Red Hat Paravirtualized Xen Drivers for Windows uninstaller** dialog box, choose **Yes** to remove the Red Hat software. Your instance will be rebooted.



> **Note**
>
> If you do not see the uninstaller dialog box, choose **Red Hat Paravirtualize** in the Windows taskbar.

7. Check that the instance has rebooted and is ready to be used.
   a. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
   b. On the **Instances** page, select **Actions**, then **Monitor and troubleshoot**, and then choose **Get system log**.
   c. The upgrade operations should have restarted the server 3 or 4 times. You can see this in the log file by the number of times `Windows is Ready to use` is displayed.

```

8. Connect to your instance and log in as the local administrator.
9. Close the **Red Hat Paravirtualized Xen Drivers for Windows uninstaller** dialog box.
10. Confirm that the installation is complete. Navigate to the `Citrix-WIN_PV` folder that you extracted earlier, open the `PVUpgrade.log` file, and then check for the text `INSTALLATION IS COMPLETE`.

Upgrade your Citrix Xen guest agent service

If you are using Citrix PV drivers on Windows Server, you can upgrade the Citrix Xen guest agent service. This Windows service handles tasks such as shutdown and restart events from the API. You can run this upgrade package on any version of Windows Server, as long as the instance is running Citrix PV drivers.

> **Important**
>
> For Windows Server 2008 R2 and later, we recommend you upgrade to AWS PV drivers that include the Guest Agent update.

Before you start upgrading your drivers, make sure you back up your important information on the instance, or create an AMI from the instance. For more information about creating an AMI, see Create an Amazon EBS-backed AMI.

> **Tip**
>
> Instead of creating the AMI from the Amazon EC2 console, you can use Systems Manager Automation to create the AMI using the `AWS-CreateImage` runbook. For more information, see AWS-CreateImage in the *AWS Systems Manager Automation runbook reference User Guide*.

If you create an AMI, make sure you do the following:

- Do not enable the Sysprep tool in the EC2Config service.
- Write down your password.
- Set your Ethernet adapter to DHCP.

To upgrade your Citrix Xen guest agent service

1. Connect to your instance and log in as the local administrator. For more information about connecting to your instance, see Connect to your Windows instance using RDP.
2.
3. Extract the contents of the upgrade package to a location of your choice.

4. Open the **Upgrade.bat** file. If you get a security warning, choose **Run**.
5. In the **Upgrade Drivers** dialog box, review the information and choose **Yes** if you are ready to start the upgrade.
6. When the upgrade is complete, the `PVUpgrade.log` file will open and contain the text `UPGRADE IS COMPLETE`.
7. Reboot your instance.

Troubleshoot PV drivers on Windows instances

The following are solutions to issues that you might encounter with older Amazon EC2 images and PV drivers.

Contents

- Windows Server 2012 R2 loses network and storage connectivity after an instance reboot
- TCP offloading
- Time synchronization
- Workloads that leverage more than 20,000 disk IOPS experience degradation due to CPU bottlenecks

Windows Server 2012 R2 loses network and storage connectivity after an instance reboot

> **Important**
>
> This issue occurs only with AMIs made available before September 2014.

Windows Server 2012 R2 Amazon Machine Images (AMIs) made available before September 10, 2014 can lose network and storage connectivity after an instance reboot. The error in the AWS Management Console system log states: “Difficulty detecting PV driver details for Console Output.” The connectivity loss is caused by the Plug and Play Cleanup feature. This features scans for and disables inactive system devices every 30 days. The feature incorrectly identifies the EC2 network device as inactive and removes it from the system. When this happens, the instance loses network connectivity after a reboot.

For systems that you suspect could be affected by this issue, you can download and run an in-place driver upgrade. If you are unable to perform the in-place driver upgrade, you can run a helper

script. The script determines if your instance is affected. If it is affected, and the Amazon EC2 network device has not been removed, the script disables the Plug and Play Cleanup scan. If the network device was removed, the script repairs the device, disables the Plug and Play Cleanup scan, and enables your instance to reboot with network connectivity enabled.

Contents

- Choose how to fix problems
- Method 1 - Enhanced networking
- Method 2 - Registry configuration
- Run the remediation script

Choose how to fix problems

There are two methods for restoring network and storage connectivity to an instance affected by this issue. Choose one of the following methods:

Method	Prerequisites	Procedure Overview
Method 1 - Enhanced networking	Enhanced networking is only available in a virtual private cloud (VPC) which requires a C3 instance type. If the server does not currently use the C3 instance type, then you must temporarily change it.	You change the server instance type to a C3 instance. Enhanced networking then enables you to connect to the affected instance and fix the problem. After you fix the problem, you change the instance back to the original instance type. This method is typically faster than Method 2 and less likely to result in user error. You will incur additional charges as long as the C3 instance is running.
Method 2 - Registry configuration	Ability to create or access a second server. Ability to change Registry settings.	You detach the root volume from the affected instance, attach it to a different instance, connect, and make

Method	Prerequisites	Procedure Overview
		changes in the Registry. You will incur additiona l charges as long as the additional server is running. This method is slower than Method 1, but this method has worked in situations where Method 1 failed to resolve the problem.

Method 1 - Enhanced networking

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Locate the affected instance. Select the instance and choose **Instance state**, and then choose **Stop instance**.

   > **Warning**
   >
   > When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

4. After the instance is stopped, create a backup. Select the instance and choose **Actions**, then **Image and templates**, and then choose **Create image**.
5. Change the instance type to any C3 instance type.
6. Start the instance.
7.
8. Extract the contents of the folder and run `AWSPVDriverSetup.msi`.

   After running the MSI, the instance automatically reboots and then upgrades the drivers. The instance will not be available for up to 15 minutes.
9. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new drivers were installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host**

Adapter. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.

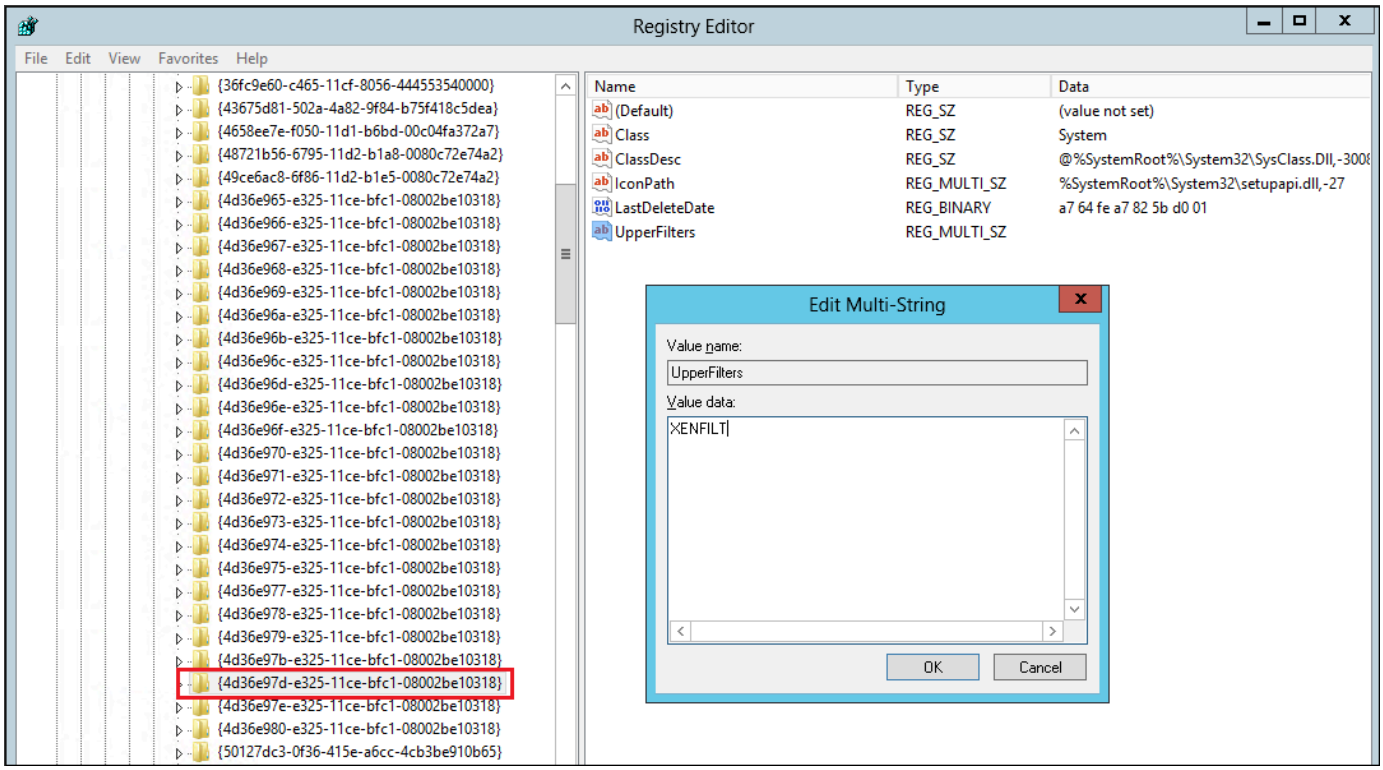
10. Stop the instance and change the instance back to its original instance type.
11. Start the instance and resume normal use.

Method 2 - Registry configuration

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Locate the affected instance. Select the instance, choose **Instance state**, and then choose **Stop instance**.

> **Warning**
>
> When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

4. Choose **Launch instances** and create a temporary Windows Server 2008 or Windows Server 2012 instance in the same Availability Zone as the affected instance. Do not create a Windows Server 2012 R2 instance.



> **Important**
>
> If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the navigation pane, choose **Volumes**.
6. Locate the root volume of the affected instance. Detach the volume and then attach the volume to the temporary instance that you created earlier. Attach it with the default device name (xvdf).
7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to make the volume available for use.
8. On the temporary instance, open the **Run** dialog box, type **`regedit`**, and press Enter.
9. In the Registry Editor navigation pane, choose **HKEY_Local_Machine**, and then from the **File** menu choose **Load Hive**.

10. In the **Load Hive** dialog box, navigate to *Affected Volume*\Windows\System32\config\System and type a temporary name in the **Key Name** dialog box. For example, enter OldSys.
11. In the navigation pane of the Registry Editor, locate the following keys:

    HKEY_LOCAL_MACHINE*your_temporary_key_name*\ControlSet001\Control\Class\4d36e97d-e325-11ce-bfc1-08002be10318

    HKEY_LOCAL_MACHINE*your_temporary_key_name*\ControlSet001\Control\Class\4d36e96a-e325-11ce-bfc1-08002be10318
12. For each key, open **UpperFilters**, enter a value of XENFILT, and then choose **OK**.

13. Locate the following key:

    HKEY_LOCAL_MACHINE*your_temporary_key_name*\ControlSet001\Services\XENBUS\Parameters
14. Create a new string (REG_SZ) with the name ActiveDevice and the following value:

    PCI\VEN_5853&DEV_0001&SUBSYS_00015853&REV_01
15. Locate the following key:

    HKEY_LOCAL_MACHINE*your_temporary_key_name*\ControlSet001\Services\XENBUS
16. Change the **Count** from 0 to 1.

17. Locate and delete the following keys:

    HKEY_LOCAL_MACHINE*your_temporary_key_name*\ControlSet001\Services\xenvbd\StartOverride

    HKEY_LOCAL_MACHINE *your_temporary_key_name*\ControlSet001\Services\xenfilt\StartOverride

18. In the Registry Editor navigation pane, choose the temporary key that you created when you first opened the Registry Editor.
19. From the **File** menu, choose **Unload Hive**.
20. In the Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose **Offline**.
21. In the Amazon EC2 console, detach the affected volume from the temporary instance and reattach it to your Windows Server 2012 R2 instance with the device name /dev/sda1. You must specify this device name to designate the volume as a root volume.
22. Start the instance.
23.
24. Extract the contents of the folder and run `AWSPVDriverSetup.msi`.

    After running the MSI, the instance automatically reboots and then upgrades the drivers. The instance will not be available for up to 15 minutes.
25. After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new drivers were installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.
26. Delete or stop the temporary instance you created in this procedure.

Run the remediation script

If you are unable to perform an in-place driver upgrade or migrate to a newer instance you can run the remediation script to fix the problems caused by the Plug and Play Cleanup task.

To run the remediation script

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

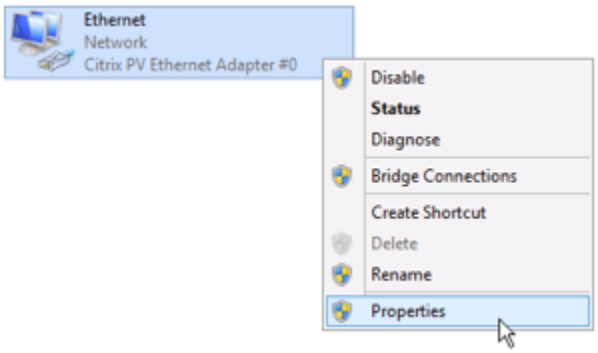
2. In the navigation pane, choose **Instances**.
3. Select the instance for which you want to run the remediation script. Choose **Instance state**, and then choose **Stop instance**.

   > **Warning**
   >
   > When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

4. After the instance is stopped, create a backup. Select the instance, choose **Actions**, then **Image and templates**, and then choose **Create image**.
5. Choose **Instance state**, and then choose **Start instance**.
6.
7. Extract the contents of the folder.
8. Run the remediation script according to the instructions in the Readme.txt file. The file is located in the folder where you extracted RemediateDriverIssue.zip.

TCP offloading

> **Important**
>
> This issue does not apply to instances running AWS PV or Intel network drivers.



By default, TCP offloading is enabled for the Citrix PV drivers in Windows AMIs. If you encounter transport-level errors or packet transmission errors (as visible on the Windows Performance Monitor)—for example, when you're running certain SQL workloads—you may need to disable this feature.

> **Warning**
>
> Disabling TCP offloading may reduce the network performance of your instance.

To disable TCP offloading for Windows Server 2012 and 2008

1. Connect to your instance and log in as the local administrator.

2. If you're using Windows Server 2012, press **Ctrl+Esc** to access the **Start** screen, and then choose **Control Panel**. If you're using Windows Server 2008, choose **Start** and select **Control Panel**.
3. Choose **Network and Internet**, then **Network and Sharing Center**.
4. Choose **Change adapter settings**.
5. Open the context (right-click) menu for **Citrix PV Ethernet Adapter #0** and select **Properties**.

6. In the **Local Area Connection Properties** dialog box, choose **Configure** to open the **Citrix PV Ethernet Adapter #0 Properties** dialog box.
7. On the **Advanced** tab, disable each of the properties, except for **Correct TCP/UDP Checksum Value**. To disable a property, select it from **Property** and choose **Disabled** from **Value**.
8. Choose **OK**.
9. Run the following commands from a Command Prompt window.

```
netsh int ip set global taskoffload=disabled
netsh int tcp set global chimney=disabled
netsh int tcp set global rss=disabled
netsh int tcp set global netdma=disabled
```

10. Reboot the instance.

Time synchronization

Prior to the release of the 2013.02.13 Windows AMI, the Citrix Xen guest agent could set the system time incorrectly. This can cause your DHCP lease to expire. If you have issues connecting to your instance, you might need to update the agent.

To determine whether you have the updated Citrix Xen guest agent, check whether the `C:\Program Files\Citrix\XenGuestAgent.exe` file is from March 2013. If the date on this file

is earlier than that, update the Citrix Xen guest agent service. For more information, see Upgrade your Citrix Xen guest agent service.

Workloads that leverage more than 20,000 disk IOPS experience degradation due to CPU bottlenecks

You can be affected by this issue if you are using Windows instances running AWS PV drivers that leverage more than 20,000 IOPS, and you experience bug check code `0x9E`: `USER_MODE_HEALTH_MONITOR`.

Disk reads and writes (IOs) in the AWS PV drivers occur in two phases: **IO preparation** and **IO completion**. By default, the preparation phase runs on a single arbitrary core. The completion phase runs on core `0`. The amount of computation required to process an IO varies based on it size and other properties. Some IOs use more computation in the preparation phase, and others in the completion phase. When an instance drives more than 20,000 IOPS, the preparation or completion phase may result in a bottleneck, where the CPU upon which it runs is at 100% capacity. Whether the preparation or completion phase becomes a bottleneck depends on the properties of the IOs used by the application.

Starting with AWS PV drivers 8.4.0, the load of the preparation phase and the completion phase can be distributed across multiple cores, eliminating bottlenecks. Each application uses different IO properties. Therefore, applying one of the following configurations may raise, lower, or not impact the performance of your application. After you apply any of these configurations, monitor the application to verify that it is meeting your desired performance.

1. **Prerequisites**

   Before you begin this troubleshooting procedure, verify the following prerequisites:

   - Your instance uses AWS PV drivers version 8.4.0 or later. To upgrade, see Upgrade PV drivers on EC2 Windows instances.
   - You have RDP access to the instance. For steps to connect to your Windows instance using RDP, see Connect to your Windows instance using an RDP client.
   - You have administrator access on the instance.

2. **Observe CPU load on your instance**

   You can use Windows Task Manager to view the load on each CPU to determine potential bottlenecks to disk IO.

1. Verify that your application is running and handling traffic similar to your production workload.
2. Connect to your instance using RDP.
3. Choose the **Start** menu on your instance.
4. Enter `Task Manager` in the **Start** menu to open Task Manager.
5. If Task Manager displays the Summary View, choose **More details** to expand the detailed view.
6. Choose the **Performance** tab.
7. Select **CPU** in the left pane.
8. Open the context (right-click) menu for the graph in the main pane and select **Change graph to**>**Logical processors** to display each individual core.
9. Depending on how many cores are on your instance, you may see lines displaying CPU load over time, or you may just see a number.
   - If you see graphs displaying load over time, look for CPUs where the box is almost entirely shaded.
   - If you see a number on each core, look for cores that consistently show 95% or greater.

10Note whether core `0` or a different core is experiencing a heavy load.

3. **Choose which configuration to apply**

Configuration name	When to apply this configuration	Notes
Default configuration	Workload is driving less than 20,000 IOPS, or other configurations did not improve performance or stability.	For this configuration, IO occurs on a few cores, which may benefit smaller workloads by increasing cache locality and reducing context switching.
Allow driver to choose whether to distribute completion	Workload is driving more than 20,000 IOPS and moderate or high load is observed on core `0`.	This configuration is recommended for all Xen instances using PV 8.4.0 or later and leveraging more

Configuration name	When to apply this configuration	Notes
		than 20,000 IOPS, whether problems are encountered.
Distribute both preparation and completion	Workload is driving more than 20,000 IOPS, and either allowing the driver to choose the distribution did not improve performance, or a core other than `0` is experiencing a high load.	This configuration enables distribution of both IO preparation and IO completion.

> **Note**
>
> We recommend that you do not distribute IO preparation without also distributing IO completion (setting `DpcRedirection` without setting `NotifierDistributed`) because the completion phase is sensitive to overload by the preparation phase when the preparation phase is running in parallel.

Registry key values

- *NotifierDistributed*

  Value `0` or not present — The completion phase will run on core `0`.

  Value 1 — The driver chooses to run the completion phase or core `0` or one additional core per attached disk.

  Value 2 — The driver runs the completion phase on one additional core per attached disk.

- *DpcRedirection*

  Value `0` or not present — The preparation phase will run on a single, arbitrary core.

  Value 1 — The preparation phase is distributed across multiple cores.

Default configuration

Apply the default configuration with AWS PV driver versions prior to 8.4.0, or if performance or stability degradation is observed after applying one of the other configurations in this section.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following commands to remove the `NotifierDistributed` and `DpcRedirection` registry keys.

```
Remove-ItemProperty -Path HKLM:\System\CurrentControlSet\Services\xenvbd
\Parameters -Name NotifierDistributed
```

```
Remove-ItemProperty -Path HKLM:\System\CurrentControlSet\Services\xenvbd
\Parameters -Name DpcRedirection
```

4. Reboot your instance.

Allow driver to choose whether to distribute completion

Set `NotiferDistributed` registry key to allow the PV storage driver to choose whether to distribute IO completion.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following command to set the `NotiferDistributed` registry key.

```
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd
\Parameters -Value 0x00000001 -Name NotifierDistributed
```

4. Reboot your instance.

Distribute both preparation and completion

Set `NotifierDistributed` and `DpcRedirection` registry keys to always distribute both the preparation and completion phases.

1. Connect to your instance using RDP.
2. Open a new PowerShell command prompt as an administrator.
3. Run the following commands to set the `NotifierDistributed` and `DpcRedirection` registry keys.

```
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd
\Parameters -Value 0x00000002 -Name NotifierDistributed
```

```
Set-ItemProperty -Type DWORD -Path HKLM:\System\CurrentControlSet\Services\xenvbd
\Parameters -Value 0x00000001 -Name DpcRedirection
```

4. Reboot your instance.

NVMe drivers

Amazon EBS volumes and instance store volumes are exposed as NVMe block devices on Nitro-based instances. To fully use the performance and capabilities of Amazon EBS features for volumes exposed as NVMe block devices, the instance must have the AWS NVMe driver installed. All current generation AWS Windows AMIs come with the AWS NVMe driver installed by default.

For more information about EBS and NVMe, see Amazon EBS and NVMe in the *Amazon EBS User Guide*. For more information about SSD instance store and NVMe, see SSD instance store volumes for EC2 instances.

Linux instances

The following AMIs include the required NVMe drivers:

- Amazon Linux 2
- Amazon Linux AMI 2018.03
- Ubuntu 14.04 or later with `linux-aws` kernel

> **Note**
>
> AWS Graviton-based instance types require Ubuntu 18.04 or later with `linux-aws` kernel

- Red Hat Enterprise Linux 7.4 or later
- SUSE Linux Enterprise Server 12 SP2 or later
- CentOS 7.4.1708 or later
- FreeBSD 11.1 or later
- Debian GNU/Linux 9 or later

To confirm that your instance has the NVMe driver

You can confirm that your instance has the NVMe driver using the following command.

- Amazon Linux, RHEL, CentOS, and SUSE Linux Enterprise Server

```
$ modinfo nvme
```

  If the instance has the NVMe driver, the command returns information about the driver.

- Amazon Linux 2 and Ubuntu

```
$ ls /sys/module/ | grep nvme
```

  If the instance has the NVMe driver, the command returns the installed drivers.

To update the NVMe driver

If your instance has the NVMe driver, you can update the driver to the latest version using the following procedure.

1. Connect to your instance.
2. Update your package cache to get necessary package updates as follows.
   - For Amazon Linux 2, Amazon Linux, CentOS, and Red Hat Enterprise Linux:

```
[ec2-user ~]$ sudo yum update -y
```

- For Ubuntu and Debian:

```
[ec2-user ~]$ sudo apt-get update -y
```

3. Ubuntu 16.04 and later include the `linux-aws` package, which contains the NVMe and ENA drivers required by Nitro-based instances. Upgrade the `linux-aws` package to receive the latest version as follows:

```
[ec2-user ~]$ sudo apt-get install --only-upgrade -y linux-aws
```

   For Ubuntu 14.04, you can install the latest `linux-aws` package as follows:

```
[ec2-user ~]$ sudo apt-get install linux-aws
```

4. Reboot your instance to load the latest kernel version.

```
sudo reboot
```

5. Reconnect to your instance after it has rebooted.

Windows instances

PowerShell

If you did not launch your instance from one of the latest AWS Windows AMIs provided by Amazon, use the following procedure to install the current AWS NVMe driver on your instance. Reboot is required for this install. Either the install script will reboot your instance or you must reboot it as the final step.

Prerequisites

- PowerShell version 3.0 or later is installed.
- The commands shown in this section must run in the 64-bit version of PowerShell. Do not use the x86 version of PowerShell. That is the 32-bit version of the shell, and is not supported for these commands.

To download and install the latest AWS NVMe driver

1. We recommend that you create an AMI as a backup as follows, in case you need to roll back your changes.

   a. When you stop an instance, the data on any instance store volumes is erased. Before you stop an instance, verify that you've copied any data that you need from your instance store volumes to persistent storage, such as Amazon EBS or Amazon S3.

   b. In the navigation pane, choose **Instances**.

   c. Select the instance that requires the driver upgrade, and choose **Instance state**, **Stop instance**.

   d. After the instance is stopped, select the instance, choose **Actions**, then **Image and templates**, and then choose **Create image**.

   e. Choose **Instance state**, **Start instance**.

2. Connect to your instance and log in as the local administrator.

3. Download the drivers to your instance using one of the following options:

   - **Browser** – the latest driver package to the instance and extract the zip archive.
   - **PowerShell** – Run the following commands:

     If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

     ```
     [Net.ServicePointManager]::SecurityProtocol =
      [Net.SecurityProtocolType]::Tls12
     ```

4. Install the driver to your instance by running the `install.ps1` PowerShell script from the `nvme_driver` directory (`.\install.ps1`). If you get an error, make sure you are using PowerShell 3.0 or later.

   a. (Optional) Starting with AWS NVMe version `1.5.0`, Small Computer System Interface (SCSI) persistent reservations are supported for Windows Server 2016 and later. This feature adds support for Windows Server Failover Clustering with shared Amazon EBS storage. By default, this feature isn't enabled during installation.

You can enable the feature when running the `install.ps1` script to install the driver by specifying the `EnableSCSIPersistentReservations` parameter with a value of `$true`.

```
PS C:\> .\install.ps1 -EnableSCSIPersistentReservations $true
```

You can disable the feature when running the `install.ps1` script to install the driver by specifying the `EnableSCSIPersistentReservations` parameter with a value of `$false`.

```
PS C:\> .\install.ps1 -EnableSCSIPersistentReservations $false
```

b. Starting with AWS NVMe `1.5.0`, the `install.ps1` script always installs the `ebsnvme-id` tool with the driver.

(Optional) For versions `1.4.0`, `1.4.1`, and `1.4.2`, the `install.ps1` script allows you to specify whether the `ebsnvme-id` tool should be installed with the driver.

i. To install the `ebsnvme-id` tool, specify `InstallEBSNVMeIdTool 'Yes'`.

ii. If you don't want to install the tool, specify `InstallEBSNVMeIdTool 'No'`.

If you don't specify `InstallEBSNVMeIdTool`, and the tool is already present at `C:\ProgramData\Amazon\Tools`, the package will upgrade the tool by default. If the tool is not present, `install.ps1` will not upgrade the tool by default.

If you don't want to install the tool as part of the package, and want to install it later, you can find the latest version or the tool in the driver package. Alternatively, you can download version `1.0.0` from Amazon S3:

5. If the installer does not reboot your instance, reboot the instance.

Distributor

You can use Distributor, a capability of AWS Systems Manager, to install the NVMe driver package one time or with scheduled updates.

To install the latest AWS NVMe driver

1. For the instructions for how to install the NVMe driver package using Distributor, see the procedures in Install or update packages in the *Amazon EC2 Systems Manager User Guide*.
2. For **Installation Type**, select **Uninstall and reinstall**.
3. For **Name**, choose **AWSNVMe**.
4. (Optional) For **Additional Arguments**, you can customize the installation by specifying values. The values must be formatted using valid JSON syntax. For examples of how to pass additional arguments for the `aws configure` package, see the Command document plugin reference.

   a. Starting with AWS NVMe `1.5.0`, the driver supports SCSI persistent reservations for Windows Server 2016 and later. By default, this feature isn't enabled during installation.

   - To enable this feature, specify `{"SSM_EnableSCSIPersistentReservations": "true"}`.
   - If you don't want to enable this feature, specify `{"SSM_EnableSCSIPersistentReservations": "false"}`.

   b. Starting with AWS NVMe `1.5.0`, the `install.ps1` script will always install the `ebsnvme-id` tool.

   (Optional) For versions `1.4.0`, `1.4.1`, and `1.4.2`, the `install.ps1` script allows you to specify whether the ebsnvme-id tool should be installed with the driver.

   - To install the ebsnvme-id tool, specify `{"SSM_InstallEBSNVMeIdTool": "Yes"}`.
   - If you don't want to install the tool, specify `{"SSM_InstallEBSNVMeIdTool": "No"}`.

     If `SSM_InstallEBSNVMeIdTool` is not specified for **Additional Arguments**, and the tool is already present at `C:\ProgramData\Amazon\Tools`, the package will upgrade the tool by default. If the tool is not present, the package will not upgrade the tool by default.

If you don't want to install the tool as part of the package, and want to install it later, you can find the latest version of the tool in the driver package. Alternatively, you can download version `1.0.0` from Amazon S3:

5. If the installer does not reboot your instance, reboot the instance.

Configure SCSI persistent reservations for Windows instances

After AWS NVMe driver version `1.5.0` or later has been installed, you can enable or disable SCSI persistent reservations using the Windows registry for Windows Server 2016 and later. You must reboot the instance for these registry changes to take effect.

You can enable SCSI persistent reservations with the following command which sets the `EnableSCSIPersistentReservations` to a value of 1.

```
PS C:\> $registryPath = "HKLM:\SYSTEM\CurrentControlSet\Services\AWSNVMe\Parameters
\Device"
Set-ItemProperty -Path $registryPath -Name EnableSCSIPersistentReservations -Value 1
```

You can disable SCSI persistent reservations with the following command which sets the `EnableSCSIPersistentReservations` to a value of `0`.

```
PS C:\> $registryPath = "HKLM:\SYSTEM\CurrentControlSet\Services\AWSNVMe\Parameters
\Device"
Set-ItemProperty -Path $registryPath -Name EnableSCSIPersistentReservations -Value 0
```

AWS NVMe Windows driver version history

The following table shows which AWS NVMe drivers run on each version of Windows Server on Amazon EC2.

Windows Server version	AWS NVMe driver version
Windows Server 2025	latest version
Windows Server 2022	latest version
Windows Server 2019	latest version

Windows Server version	AWS NVMe driver version
Windows Server 2016	latest version
Windows Server 2012 R2	version 1.5.1 and earlier
Windows Server 2012	version 1.5.1 and earlier
Windows Server 2008 R2	version 1.3.2 and earlier
Windows Server 2008	version 1.3.2 and earlier

The following table describes the released versions of the AWS NVMe driver.

Package version	Driver version	Details	Release date
	1.8.2	• Fixed bug check on startup by improving interrupt handling.	June 15, 2026
	1.8.1	• Fixed a backward compatibility issue with disk serial number generation.	February 24, 2026
1.8.0	1.8.0	• Added support for IOCTLs to operate with devices that implement dynamic namespace managemen t. For more information, see IOCTL_SCSI_MINIPORT IOCTL in the Microsoft documentation. • Bug fixes in the Get Log Page command and serial number generation.	January 16, 2026
	1.7.0	• Added support for NVMe Get Log Page Command. • Added support for detailed performance statistics for EBS and EC2 instance store volumes.	September 17, 2025

Package version	Driver version	Details	Release date
		• Bug fixes for the Identify Namespace command.	
	1.6.0	• Updated the install script to use PnPUtil. • Updated ebsnvme-id.exe to use NVMe IOCTL.	October 25, 2024
	1.5.0	Fixed the install script to create a folder for the `ebsnvme-id` tool if it is not present.	November 17, 2023
1.5.0	1.5.0	Added support for Small Computer System Interface (SCSI) persistent reservations for instances running Windows Server 2016 and later. The ebsnvme-id tool (`ebsnvme-id.exe`) is now installed by default.	August 31, 2023
1.4.2	1.4.2	Fixed a bug where the AWS NVMe driver did not support instance store volumes on D3 instances.	March 16, 2023
1.4.1	1.4.1	Reports Namespace Preferred Write Granularity (NPGW) for EBS volumes that support this optional NVMe feature. For more information, see section 8.25, "Improving Performance through I/O Size and Alignment Adherence," in the NVMe Base Specification, version 1.4.	May 20, 2022

Package version	Driver version	Details	Release date
1.4.0	1.4.0	• Added support for IOCTLs that allow applications to interact with NVMe devices. This support allows applications to get `IdentifyController`, `IdentifyNamespace`, and `NameSpace` list from the NVMe device. For more information, see Protocol-specific queries in the Microsoft documentation. • The 1.4.0 driver version and the latest `ebsnvme-id` tool (`ebsnvme-id.exe`) are combined in a single package. This combination allows you to install both driver and tool from a single package. For more details, see NVMe drivers. • Bug fixes and reliability improvements.	November 23, 2021
	1.3.2	Fixed issue with modifying EBS volumes actively processing IO, which may result in data corruption. Customers who do not modify online EBS volumes (for example, resizing or changing type) are not impacted. This is the last version that can run on Windows Server 2008 and 2008 R2. This version is available for download but no longer supported. Windows Server 2008 and 2008 R2 has reached end-of-life, and is no longer supported by Microsoft.	September 10, 2019
1.3.1	1.3.1	Reliability Improvements.	May 21, 2019
1.3.0	1.3.0	Device optimization improvements.	August 31, 2018

Package version	Driver version	Details	Release date
1.2.0	1.2.0	Performance and reliability improvements for AWS NVMe devices on all supported instances, including bare metal instances.	June 13, 2018
>1.0.0	>1.0.0	AWS NVMe driver for supported instance types running Windows Server.	February 12, 2018

Subscribe to notifications

Amazon SNS can notify you when new versions of EC2 Windows Drivers are released. Use the following procedure to subscribe to these notifications.

To subscribe to EC2 notifications from the console

1. Open the Amazon SNS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/sns/v3/home.
2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to are in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:
   a. For **TopicARN**, copy the following Amazon Resource Name (ARN):

      arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers
   b. For **Protocol**, choose `Email`.
   c. For **Endpoint**, type an email address that you can use to receive the notifications.
   d. Choose **Create subscription**.
6. You'll receive a confirmation email. Open the email and follow the directions to complete your subscription.

Whenever new EC2 Windows drivers are released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

To unsubscribe from Amazon EC2 Windows driver notification

1. Open the Amazon SNS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/sns/v3/home.
2. In the navigation pane, choose **Subscriptions**.
3. Select the checkbox for the subscription and then choose **Actions**, **Delete subscriptions**. When prompted for confirmation, choose **Delete**.

To subscribe to EC2 notifications using the AWS CLI

To subscribe to EC2 notifications with the AWS CLI, use the following command.

```
aws sns subscribe --topic-arn arn:aws:sns:us-east-1:801119661308:ec2-windows-drivers --
protocol email --notification-endpoint YourUserName@YourDomainName.ext
```

To subscribe to EC2 notifications using AWS Tools for Windows PowerShell

To subscribe to EC2 notifications with AWS Tools for Windows PowerShell, use the following command.

```
Connect-SNSNotification -TopicArn 'arn:aws:sns:us-east-1:801119661308:ec2-windows-
drivers' -Protocol email -Region us-east-1 -Endpoint 'YourUserName@YourDomainName.ext'
```

Other Windows device drivers

The AWS VMClock device is a virtual clock device that is present on Nitro-based instances. The device appears in Device Manager under **System devices** as `AWS VMClock Device`. AWS provides a null (no-function) driver package for Windows that allows the operating system to recognize the device.

Supported instances

The AWS VMClock device is available on Nitro-based instance types. For a list of Nitro-based instance types, see Nitro-based instances.

Supported operating systems

The driver package supports the following versions of Windows Server:

- Windows Server 2016
- Windows Server 2019
- Windows Server 2022
- Windows Server 2025

Driver installation

If the AWS VMClock device shows a warning icon in Device Manager, which indicates that no driver is installed, you can install the null driver package manually.

To install the AWS VMClock driver

1. Download and extract the driver package from Amazon S3.

```
Invoke-WebRequest https://s3.amazonaws.com/ec2-windows-drivers-downloads/
AWSVMClock/Latest/AWSVMClock.zip -OutFile $env:USERPROFILE\AWSVMClock.zip
Expand-Archive $env:USERPROFILE\AWSVMClock.zip -DestinationPath $env:USERPROFILE
\AWSVMClock
```

2. Install the driver using `pnputil`.

```
pnputil /add-driver $env:USERPROFILE\AWSVMClock\aws_vmclock.inf /install
```

3. Verify the device status in Device Manager. You don't need to reboot the instance.

Configure your Amazon EC2 Windows instance

After you've launched a Windows instance, you can log in as an administrator to perform additional configuration for Windows features and system settings. EC2 Windows troubleshooting utilities can help you troubleshoot issues on your instance.

You can configure Windows launch agents and other Windows-specific features as follows.

Windows launch agents

Each AWS Windows AMI (and many other AMIs that are available on the AWS Marketplace) includes a Windows launch agent that's pre-configured with default settings. Launch agents perform tasks during instance startup and run if an instance is stopped and later started, or restarted.

EC2 Fast Launch for Windows

Every Amazon EC2 Windows instance must go through the standard Windows operating system (OS) launch steps, which include several reboots, and often take 15 minutes or longer to complete. Amazon EC2 Windows Server AMIs that have the EC2 Fast Launch feature enabled complete some of those steps and reboots in advance to reduce the time it takes to launch an instance.

Windows-specific system settings

The following list includes some system settings that apply only for Windows operating systems:

Change the Windows Administrator password

When you connect to a Windows instance, you must specify a user account and password that has permission to access the instance. The first time that you connect to an instance, you must use the Administrator account and provide the default password. When you connect to an instance the first time, we recommend that you change the Administrator password from its default value.

Add Windows System components

Windows Server operating systems include many optional components. Including all optional components in each AWS Windows Server AMI is not practical. Instead, we provide installation media EBS snapshots that have the necessary files to configure or install components on your Windows instance.

Install WSL on Windows

Windows Subsystem for Linux (WSL) is a free download that you can install on your Windows instance. By installing WSL, you can run native Linux command line tools directly on your Windows instance and use the Linux tools for scripting, alongside your traditional Windows desktop. You can easily swap between Linux and Windows on a single Windows instance, which you might find useful in a development environment.

AWS device drivers for Windows instances

You can update the AWS device drivers for your Windows instances. For more information, see the section called “Manage device drivers”.

The following table summarizes the supported drivers for Nitro-based instances by Windows version.

Version	Storage driver	Enhanced networking driver
Windows Server 2025	AWS NVMe latest version	ENA latest version
Windows Server 2022	AWS NVMe latest version	ENA latest version
Windows Server 2019	AWS NVMe latest version	ENA latest version
Windows Server 2016	AWS NVMe latest version	ENA latest version
Windows Server 2012 R2	AWS NVMe version 1.5.1	ENA version 2.6.0
Windows Server 2008 R2	AWS NVMe version 1.3.2	ENA version 2.2.3

The following table summarizes the supported drivers for Xen-based instances by Windows version.

Version	Storage driver	Enhanced networking driver
Windows Server 2022	AWS PV latest version	• ENA latest version [1] • Intel VF [2] • AWS PV latest version [3]
Windows Server 2019	AWS PV latest version	• ENA latest version [1] • Intel VF [2] • AWS PV latest version [3]
Windows Server 2016	AWS PV latest version	• ENA latest version [1] • Intel VF [2] • AWS PV latest version [3]
Windows Server 2012 R2	AWS PV version 8.4.3	• ENA version 2.6.0 [1]

Version	Storage driver	Enhanced networking driver
		• Intel VF [2] • AWS PV version 8.4.3 [3]
Windows Server 2008 R2	AWS PV version 8.3.5	• ENA version 2.2.3 [1] • Intel VF [2] • AWS PV version 8.3.5 [3]

[1] For instance types G3, H1, I3, `m4.16xlarge`, P3, P3dn, and R4.

[2] For instance types C3, C4, D2, I2, M4 (excluding `m4.16xlarge`), and R3.

[3] For instance types C1, M1, M2, M3, T1, T2, X1, and X1e.

Windows launch agents on Amazon EC2 Windows instances

Each AWS Windows AMI includes a Windows launch agent that's pre-configured with default settings. Launch agents perform tasks during instance startup and run if an instance is stopped and later started, or restarted. For information about a specific agent, see the detail pages in the following list.

For more information about AWS Windows AMIs, see the AWS Windows AMI reference.

- Use the EC2Launch v2 agent to perform tasks during EC2 Windows instance launch
- Use the EC2Launch v1 agent to perform tasks during EC2 Windows instance launch
- Use the EC2Config service to perform tasks during EC2 legacy Windows operating system instance launch

Content

- Compare Amazon EC2 launch agents
- Configure DNS Suffix for EC2 Windows launch agents
- Subscribe to EC2 Windows launch agent notifications
- Windows Service administration for EC2Launch v2 and EC2Config agents

Compare Amazon EC2 launch agents

The following table shows the major functional differences between EC2Config, EC2Launch v1, and EC2Launch v2.

Feature	EC2Config	EC2Launch v1	EC2Launch v2
Run as	Windows Service	PowerShell Scripts	Windows Service
Supports	Legacy OS only	Windows Server versions: • 2016 • 2019 (LTSC and SAC)	Windows Server versions: • 2016 • 2019 (LTSC and SAC) • 2022 • 2025
Configuration file	XML	JSON	JSON/YAML
Set Administrator username	No	No	Yes
Compressed user data	No	No	Yes
Local user data baked on AMI	No	No	Yes, configurable
Task configuration in user data	No	No	Yes
Configurable wallpaper	No	No	Yes
Customize task run order	No	No	Yes
Configurable tasks	15	9	20 at launch

Feature	EC2Config	EC2Launch v1	EC2Launch v2
Supports Windows Event Viewer	Yes	No	Yes
Number of Event Viewer event types	2	0	30

> **Note**
>
> EC2Config documentation is provided for historical reference only. The operating system versions it runs on are no longer supported by Microsoft. We strongly recommend that you upgrade to the latest launch service.

Configure DNS Suffix for EC2 Windows launch agents

With Amazon EC2 launch agents, you can configure a list of DNS suffixes that Windows instances use for domain name resolution. The launch agents override the standard Windows settings in the `System\CurrentControlSet\Services\Tcpip\Parameters\SearchList` registry key by adding the following values to the DNS suffix search list:

- The domain of the instance
- The suffixes that result from devolution of the instance domain
- NV domain
- The domains specified by each network interface cards

All launch agents support DNS suffix configuration. For more information, see your specific launch agent version:

- For information about the `setDnsSuffix` task and how to configure DNS suffixes in EC2Launch v2, see setDnsSuffix.
- For information about DNS suffix list setup and how to enable or disable devolution for EC2Launch v1, see Configure the EC2Launch v1 agent on your Windows instance.
- For information about DNS suffix list setup and how to enable or disable devolution for EC2Config, see EC2Config settings files.

Domain name devolution

Domain name devolution is an Active Directory behavior that allows computers in a child domain to access resources in the parent domain without using a fully qualified domain name. By default, domain name devolution continues until there are only two nodes left in the domain name progression.

Launch agents perform devolution on the domain name if the instance is connected to a domain, and add the results to the DNS suffix search list that's maintained in the **`System\CurrentControlSet\Services\Tcpip\Parameters\SearchList`** registry key. The agents use the settings from the following registry keys, to determine the devolution behavior.

- **`System\CurrentControlSet\Services\Tcpip\Parameters\UseDomainNameDevolution`**
  - When not set, disables devolution
  - When set to `1`, enables devolution (default)
  - When set to `0`, disables devolution
- **`System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel`**
  - When not set, use level of 2 (default)
  - When set to 3 or greater, use value to set level

When you disable devolution or change your devolution settings to a higher level, the `System\CurrentControlSet\Services\Tcpip\Parameters\SearchList` registry key stil contains the suffixes that were added previously. They are not automatically removed. You can manually update the list, or you can clear the list and let your agent run through the process to set up the new list.

> **Note**
>
> To clear the DNS suffix list from the registry, you can run the following command.
>
> ```
> PS C:\> Invoke-CimMethod -ClassName Win32_NetworkAdapterConfiguration -
> MethodName "SetDNSSuffixSearchOrder" -Arguments @{ DNSDomainSuffixSearchOrder =
>  $null } | Out-Null
> ```

Devolution examples

The following examples show domain name progression through the devolution process.

`corp.example.com`

- Progresses to `example.com`

`locale.region.corp.example.com`

1. Progresses to `region.corp.example.com`
2. Progresses to `corp.example.com`
3. Progresses to `example.com`

`locale.region.corp.example.com` with a setting of `DomainNameDevolutionLevel=3`

1. Progresses to `region.corp.example.com`
2. Progresses to `corp.example.com`. The progression stops here, due to the level setting.

Subscribe to EC2 Windows launch agent notifications

Amazon SNS can notify you when new versions of the EC2 launch agents are released. Use the following procedure to subscribe to these notifications.

Subscribe to EC2Config notifications

1. Open the Amazon SNS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/sns/v3/home.
2. In the navigation bar, change the Region to **US East (N. Virginia)**, if necessary. You must select this Region because the SNS notifications that you are subscribing to were created in this Region.
3. In the navigation pane, choose **Subscriptions**.
4. Choose **Create subscription**.
5. In the **Create subscription** dialog box, do the following:

    a. For **Topic ARN**, use the following Amazon Resource Name (ARN) that matches the agent you want to receive notifications for:

- **EC2Launch or EC2Config**:

```
arn:aws-eusc:sns:us-east-1:801119661308:ec2-windows-ec2config
```

b. For **Protocol**, choose `Email`.

c. For **Endpoint**, enter the email address where you want to receive the notifications.

d. Choose **Create subscription**.

6. You'll receive a email asking you to confirm your subscription. Open the email and follow the directions to complete your subscription.

Whenever a new version of the launch agent is released, we send notifications to subscribers. If you no longer want to receive these notifications, use the following procedure to unsubscribe.

Unsubscribe from launch agent notifications

1. Open the Amazon SNS console.
2. In the navigation pane, choose **Subscriptions**.
3. Select the subscription and then choose **Actions**, **Delete subscriptions**. When prompted for confirmation, choose **Delete**.

Windows Service administration for EC2Launch v2 and EC2Config agents

If you've logged into your instance as a user with administrative rights, you can manage the EC2Launch v2 and EC2Config launch agents just as you would any other Windows service. EC2Launch v1 is a set of PowerShell scripts that is managed through a scheduled task by default. This section covers service administration for EC2Launch v2 and EC2Config.

To apply updated settings to your instance, you can stop and restart the EC2Launch v2 agent or the EC2Config service launch agent from the Microsoft Management Console (MMC) interface for Services. Similarly, when you install a new version of the launch agent, you must stop the agent first, then restart it when the installation is complete.

> **Note**
>
> You must open the MMC Services interface as an administrator to select these actions. To do this, you can select **Run as administrator** from the context menu. Alternatively, to open the interface using your keyboard, follow these steps:

1. Using the `Tab` key or arrow keys, select the **Services** menu item from the **Administrative Tools** menu.
2. Use the following keyboard combination to open as an administrator: `Ctrl` + `Shift` + `Enter`.

The following procedures list steps to stop and start the launch agent on your instance.

Stop the launch agent

1. Launch and connect to your Windows instance.
2. Select **Administrative Tools** from the Windows **Start** menu.
3. Open the **Services** console as an administrator, as described at the beginning of this section.
4. In the list of services, select the agent that's running on your instance (**EC2Launch** or **EC2Config**), then choose **Stop** from the **Action** menu. Alternatively, you can use the context menu to stop the agent.

Restart the launch agent

1. Launch and connect to your Windows instance.
2. Select **Administrative Tools** from the Windows **Start** menu.
3. Open the **Services** console as an administrator, as described at the beginning of this section.
4. In the list of services, select the agent that's running on your instance (**EC2Launch** or **EC2Config**), then choose **Start** or **Restart** from the **Action** menu. Alternatively, you can use the context menu to restart the agent.

If you don't need to update the configuration settings, create your own AMI, or use AWS Systems Manager, you can delete or uninstall the launch agent.

Delete

Deleting a service removes its registry subkey.

Uninstall

Uninstalling a service removes the files, the registry subkey, and any shortcuts to the service.

Delete the launch agent

1. Launch and connect to your Windows instance.
2. Start a Windows Command Prompt window.
3. Run one of the following commands to delete the launch agent.
   - Run the following command to delete the EC2Launch or EC2Launch v2:

     ```
     sc delete ec2launch
     ```

   - Run the following command to delete the EC2Config service:

     ```
     sc delete ec2config
     ```

Uninstall the launch agent

1. Launch and connect to your Windows instance.
2. Choose **Windows System**, then **Control Panel** from the Windows **Start** menu.
3. Choose **Programs and Features** to open the list of programs that are installed on your instance.
4. Select your launch agent from the list (**Amazon EC2Launch** or **EC2ConfigService**), then choose **Uninstall** from the **File** menu. Alternatively, you can use the context menu.

   > **Note**
   >
   > You can see what launch agent version is installed in the **Version** column.

Use the EC2Launch v2 agent to perform tasks during EC2 Windows instance launch

All supported instances of Amazon EC2 that are launched from AWS Windows Server 2022 and Windows Server 2025 AMIs include the EC2Launch v2 launch agent (`EC2Launch.exe`) by default. We also provide Windows Server 2016 and 2019 AMIs with EC2Launch v2 installed as the default launch agent. These AMIs are provided in addition to the Windows Server 2016 and 2019 AMIs that include EC2Launch v1. You can search for Windows AMIs that include EC2Launch v2 by default

by entering the following prefix in your search from the **AMIs** page in the Amazon EC2 console: `EC2LaunchV2-Windows_Server-*`.

To compare launch agent version features, see Compare Amazon EC2 launch agents.

EC2Launch v2 performs tasks during instance startup and runs if an instance is stopped and later started, or restarted. EC2Launch v2 can also perform tasks on demand. Some of these tasks are automatically enabled, while others must be enabled manually. The EC2Launch v2 service supports all EC2Config and EC2Launch features.

This service uses a configuration file to control its operation. You can update the configuration file using either a graphical tool or by directly editing it as a single .yml file (`agent-config.yml`). For more information about file locations, see EC2Launch v2 directory structure.

EC2Launch v2 publishes Windows event logs to help you troubleshoot errors and set triggers. For more information, see Windows event logs.

Supported OS versions

The EC2Launch v2 agent supports the following Windows Server operating system (OS) versions:

- Windows Server 2025
- Windows Server 2022
- Windows Server 2019 (Long-Term Servicing Channel and Semi-Annual Channel)
- Windows Server 2016

Tasks that run by default

The EC2Launch v2 agent runs the following tasks one time only by default during the initial instance launch. Tasks are organized according to the order in which they run within their launch stage.

`Boot` stage

- extendRootPartition

`PreReady` stage

- activateWindows
- setDnsSuffix

- setAdminAccount
- setWallpaper

`PostReady` stage

- startSsm

EC2Launch v2 concepts

The following concepts are useful to understand when considering EC2Launch v2.

agent-config

`agent-config` is a file that is located in the configuration folder for EC2Launch v2. It includes configuration for the boot, network, PreReady, and PostReady stages. This file is used to specify the instance configuration for tasks that should run when the AMI is either booted for the first time or for subsequent times.

By default, the EC2Launch v2 installation installs an `agent-config` file that includes recommended configurations that are used in standard Amazon Windows AMIs. You can update the configuration file to alter the default boot experience for your AMI that EC2Launch v2 specifies. For more information about file locations, see EC2Launch v2 directory structure.

Frequency

Task frequency determines when tasks should run, depending on the boot context. Most tasks have only one allowed frequency. You can specify a frequency for `executeScript` tasks.

You will see the following frequencies in the EC2Launch v2 task configuration.

- Once – The task runs once, when the AMI has booted for the first time (finished Sysprep).
- Always – The task runs every time that the launch agent runs. The launch agent runs when:
  - an instance starts or restarts
  - the EC2Launch service runs
  - `EC2Launch.exe run` is invoked

Stage

A stage is a logical grouping of tasks that the EC2Launch v2 agent runs. Some tasks can run only in a specific stage. Others can run in multiple stages. When using `agent-config.yml`, you must specify a list of stages, and a list of tasks to run within each stage.

The service runs stages in the following order:

Stage 1: Boot

Stage 2: Network

Stage 3: PreReady

Windows is ready

After the PreReady stage completes, the service sends the `Windows is ready` message to the Amazon EC2 console.

Stage 4: PostReady

User data runs during the *PostReady* stage. Some script versions run before the `agent-config.yml` file *PostReady* stage, and some run after, as follows:

Before `agent-config.yml`

- YAML user data version 1.1
- XML user data

After `agent-config.yml`

- YAML user data version 1.0 (legacy version for backwards compatibility)

For example stages and tasks, see Example: `agent-config.yml`.

When you use user data, you must specify a list of tasks for the launch agent to run. The stage is implied. For example tasks, see Example: user data.

EC2Launch v2 runs the list of tasks in the order that you specify in `agent-config.yml` and in user data. Stages run sequentially. The next stage starts after the previous stage completes. Tasks also run sequentially.

Task

You can invoke a task to perform an action on an instance. You can configure tasks in the `agent-config.yml` file or through user data. For a list of available tasks for EC2Launch v2, see EC2Launch v2 tasks. For task configuration schema and details, see EC2Launch v2 task configuration.

User data

User data is data that is configurable when you launch an instance. You can update user data to dynamically change how custom AMIs or quickstart AMIs are configured. EC2Launch

v2 supports 60 kB user data input length. User data includes only the UserData stage, and therefore runs after the `agent-config` file. You can enter user data when you launch an instance using the launch instance wizard, or you can modify user data from the EC2 console. For more information about working with user data, see How Amazon EC2 handles user data for Windows instances.

EC2Launch v2 task overview

EC2Launch v2 can perform the following tasks at each boot:

- Set up new and optionally customized wallpaper that renders information about the instance.
- Set the attributes for the administrator account that is created on the local machine.
- Add DNS suffixes to the list of search suffixes. Only suffixes that do not already exist are added to the list.
- Set drive letters for any additional volumes and extend them to use available space.
- Write files from the configuration to the disk.
- Run scripts specified in the EC2Launch v2 config file or from `user-data`. Scripts from `user-data` can be plain text or zipped and provided as a base64 format.
- Run a program with given arguments.
- Set the computer name.
- Send instance information to the Amazon EC2 console.
- Send the RDP certificate thumbprint to the Amazon EC2 console.
- Dynamically extend the operating system partition to include any unpartitioned space.
- Run user data. For more information about specifying user data, see EC2Launch v2 task configuration.
- Set non-persistent static routes to reach the metadata service and AWS KMS servers.
- Set non-boot partitions to `mbr` or `gpt`.
- Start the Systems Manager service following Sysprep.
- Optimize ENA settings.
- Enable OpenSSH for later Windows versions.
- Enable Jumbo Frames.
- Set Sysprep to run with EC2Launch v2.
- Publish Windows event logs.

EC2Launch v2 directory structure

EC2Launch v2 should be installed in the following directories:

- Service binaries: `%ProgramFiles%\Amazon\EC2Launch`
- Service data (settings, log files, and state files): `%ProgramData%\Amazon\EC2Launch`

> **Note**
>
> By default, Windows hides files and folders under `C:\ProgramData`. To view EC2Launch v2 directories and files, you must either enter the path in Windows Explorer or change the folder properties to show hidden files and folders.

The `%ProgramFiles%\Amazon\EC2Launch` directory contains binaries and supporting libraries. It includes the following subdirectories:

- `settings`
  - `EC2LaunchSettingsUI.exe` – user interface for modifying the `agent-config.yml` file
  - `YamlDotNet.dll` – DLL for supporting some operations in the user interface
- `tools`
  - `ebsnvme-id.exe` – tool for examining the metadata of the EBS volumes on the instance
  - `AWSAcpiSpcrReader.exe` – tool for determining the correct COM port to use
  - `EC2LaunchEventMessage.dll` – DLL for supporting the Windows event logging for EC2Launch
- `service`
  - `EC2LaunchService.exe` – Windows service executable that is launched when the launch agent runs as a service
- `EC2AgentTelemetry.dll` – DLL for supporting EC2 agent telemetry
- `EC2Launch.exe` – main EC2Launch executable
- `EC2LaunchAgentAttribution.txt` – attribution for code used within EC2 Launch

The `%ProgramData%\Amazon\EC2Launch` directory contains the following subdirectories. All of the data produced by the service, including logs, configuration, and state, is stored in this directory.

- `config` – Configuration

  The service configuration file is stored in this directory as `agent-config.yml`. This file can be updated to modify, add, or remove default tasks run by the service. Permission to create files in this directory is restricted to the administrator account to prevent privilege escalation.

- `log` – Instance logs

  Logs for the service (`agent.log`) and telemetry (`telemetry.log`) are stored in this directory. When `agent.log` reaches 1 MB in size, it is automatically rotated and a backup file is created with a timestamp format (for example, `agent-2026-03-02T18-56-39.188.log`). Only one backup log file is maintained at a time.

- `state` – Service state data

  The state that the service uses to determine which tasks should run is stored here. There is a `.run-once` file that indicates whether the service has already run after Sysprep (so tasks with a frequency of once will be skipped on the next run). This subdirectory includes a `state.json` and `previous-state.json` to track the status of each task.

- `sysprep` – Sysprep

  This directory contains files that are used to determine which operations to perform by Sysprep when it creates a customized Windows AMI that can be reused.

- `wallpaper` – Wallpaper

  This wallpaper images is stored in this directory.

Telemetry

Telemetry is additional information that helps AWS to better understand your requirements, diagnose issues, and deliver features to improve your experience with AWS services.

EC2Launch v2 version `2.1.592` and later collect telemetry, such as usage metrics and errors. This data is collected from the Amazon EC2 instance on which EC2Launch v2 runs. This includes all Windows AMIs owned by AWS.

The following types of telemetry are collected by EC2Launch v2:

- **Usage information** — agent commands, install method, and scheduled run frequency.

- **Errors and diagnostic information** — agent installation error codes, run error codes, and error call stacks.

Examples of collected data from version 2.0.592 through 2.1.1:

```
2025/07/18 22:38:52Z: EC2LaunchTelemetry: IsTelemetryEnabled=true
2025/07/18 22:38:52Z: EC2LaunchTelemetry: AgentOsArch=windows_amd64
2025/07/18 22:38:52Z: EC2LaunchTelemetry: IsAgentScheduledPerBoot=true
2025/07/18 22:38:52Z: EC2LaunchTelemetry: AgentCommandErrorCode=0
2025/07/18 22:38:52Z: EC2LaunchTelemetry: AdminPasswordTypeCode=0
2025/07/18 22:38:52Z: EC2LaunchTelemetry: IpConflictDetectionCode=0
2025/07/18 22:38:52Z: EC2LaunchTelemetry: AgentErrorLocation=addroutes.go:49
```

Starting with version 2.2.63, EC2 Agent telemetry data is formatted as a JSON object:

```
{"type":"EC2AgentTelemetry","agentId":"WindowsLaunchAgentV2" ... }
```

Telemetry is enabled by default. You can disable telemetry collection at any time.

Disable telemetry on an instance

To disable telemetry for a single instance, you can either set a system environment variable, or use the MSI to modify the installation.

To disable telemetry by setting a system environment variable, run the following command as an administrator.

```
setx /M EC2LAUNCH_TELEMETRY 0
```

To disable telemetry using the MSI, run the following command after you download the MSI.

```
msiexec /i ".\AmazonEC2Launch.msi" Remove="Telemetry" /q
```

More topics for EC2Launch v2

- Install the latest version of EC2Launch v2
- Configure EC2Launch v2 settings for Windows instances
- Task definitions for EC2Launch v2 startup tasks
- Troubleshoot issues with the EC2Launch v2 agent

- EC2Launch v2 version histories

Install the latest version of EC2Launch v2

You can use one of the following methods to install the EC2Launch v2 agent on your EC2 instance:

- Download the agent from Amazon S3 and install with Windows PowerShell. For download URLs, see EC2Launch v2 downloads on Amazon S3.
- Install from an EC2 Image Builder component when you create a custom image.
- Launch your instance from an AMI that has EC2Launch v2 pre-installed.

> **Warning**
>
> AmazonEC2Launch.msi uninstalls previous versions of the EC2 launch services, such as EC2Launch (v1) and EC2Config.

For install steps, select the tab that matches your preferred method.

PowerShell

To install the latest version of EC2Launch v2 agent with Windows PowerShell, follow these steps.

1. Create your local directory.

```
New-Item -Path "$env:USERPROFILE\Desktop\EC2Launchv2" -ItemType Directory
```

2. Set the URL for your download location. Run the following command with the Amazon S3 URL you'll use. For download URLs, see EC2Launch v2 downloads on Amazon S3

```
$Url = "Amazon S3 URL/AmazonEC2Launch.msi"
```

3. Use the following compound command to download the agent and run the install

```
$DownloadFile = "$env:USERPROFILE\Desktop\EC2Launchv2\" + $(Split-Path -Path
 $Url -Leaf)
Invoke-WebRequest -Uri $Url -OutFile $DownloadFile
msiexec /i "$DownloadFile"
```

> **Note**
>
> If you receive an error when downloading the file, and you are using Windows Server 2016 or earlier, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:
>
> ```
> [Net.ServicePointManager]::SecurityProtocol =
>  [Net.SecurityProtocolType]::Tls12
> ```

4. The **msiexec** command installs EC2Launch v2 in the following location on Windows Server instances: `%ProgramFiles%\Amazon\EC2Launch`. To verify that the install ran, you can check the local file system on your instance.

EC2 Image Builder component

You can install the `ec2launch-v2-windows` component when you build a custom image with EC2 Image Builder. For instructions on how to build a custom image with EC2 Image Builder, see Create an image pipeline using the EC2 Image Builder console wizard in the *EC2 Image Builder User Guide*.

AMI

EC2Launch v2 is preinstalled by default on AMIs for the Windows Server 2022 and above operating systems:

- Windows_Server-*version*-English-Full-Base
- Windows_Server-*version*-English-Core-Base
- Windows_Server-*version*-English-Core-EKS_Optimized
- Windows Server *version* AMIs with all other languages
- Windows Server *version* AMIs with SQL installed

EC2Launch v2 is also preinstalled on the following Windows Server AMIs. You can find these AMIs from the Amazon EC2 console, or by using the following search prefix: `EC2LaunchV2-` in the AWS CLI.

- EC2LaunchV2-Windows_Server-2019-English-Core-Base

- EC2LaunchV2-Windows_Server-2019-English-Full-Base
- EC2LaunchV2-Windows_Server-2016-English-Core-Base
- EC2LaunchV2-Windows_Server-2016-English-Full-Base

Automatically install and update EC2Launch v2 with AWS Systems Manager Distributor Quick Setup

With AWS Systems Manager Distributor Quick Setup, you can set up automatic updates for EC2Launch v2. The following process sets up a Systems Manager Association on your instance that automatically updates the EC2Launch v2 agent at a frequency that you specify. The Association that the Distributor Quick Setup creates can include instances within an AWS account and Region, or instances within an AWS Organization. For more information about setting up an organization, see Tutorial: Creating and configuring an organization in the *AWS Organizations User Guide*.

Before you begin, make sure that your instances meet all of the prerequisites.

Prerequisites

To set up automatic updates with Distributor Quick Setup, your instances must meet the following prerequisites.

- You have at least one running instance that supports EC2Launch v2. See supported operating systems for EC2Launch v2.
- You've performed the Systems Manager set-up tasks on your instances. For more information, see Setting up Systems Manager in the *AWS Systems Manager User Guide*.
- EC2Launch v2 must be the only launch agent installed on your instance. If you have more than one launch agent installed, your Distributor Quick Setup configuration will fail. Before you configure EC2Launch v2 with a Distributor Quick Setup, uninstall EC2Config or EC2Launch v1 launch agents, if they exist.

Configure Distributor Quick Setup for EC2Launch v2

To create a configuration for EC2Launch v2 with Distributor Quick Setup, use the following settings when you complete the steps for Distributor package deployment:

- **Software packages:** Amazon EC2Launch v2 agent.
- **Update frequency:** Select a frequency from the list.

- **Targets:** Choose from the available deployment options.

To check the status of your configuration, navigate to the Systems Manager Quick Setup **Configurations** tab in the AWS Management Console.

1. Open the AWS Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager/.
2. In the navigation pane, choose **Quick Setup**.
3. In the **Configurations** tab, select the row that's associated with the configuration that you created. The **Configurations** tab lists your configurations, and includes a summary of key details, such as **Region**, **Deployment status**, and **Association status**.

   > **Note**
   >
   > The association name for every EC2Launch v2 Distributor configuration begins with the following prefix: `AWS-QuickSetup-Distributor-EC2Launch-Agent-`.

4. To view details, select the configuration and choose **View details**.

For more information and troubleshooting steps, see Troubleshooting Quick Setup results in the *AWS Systems Manager User Guide*.

EC2Launch v2 downloads on Amazon S3

To install the latest version of EC2Launch v2, download the installer from the following location:

-

Configure install options

When you install or upgrade EC2Launch v2, you can configure installation options with the EC2Launch v2 install dialog or with the **msiexec** command in a command line shell.

The first time the EC2Launch v2 installer runs on an instance, it initializes launch agent settings on your instance as follows:

- It creates the local path and writes the launch agent file to it. This is sometimes referred to as a *clean install*.

- It creates the EC2LAUNCH_TELEMETRY environment variable if it doesn't already exist, and sets it based on your configuration.

For configuration details, select the tab that matches the configuration method that you'll use.

Amazon EC2Launch Setup dialog

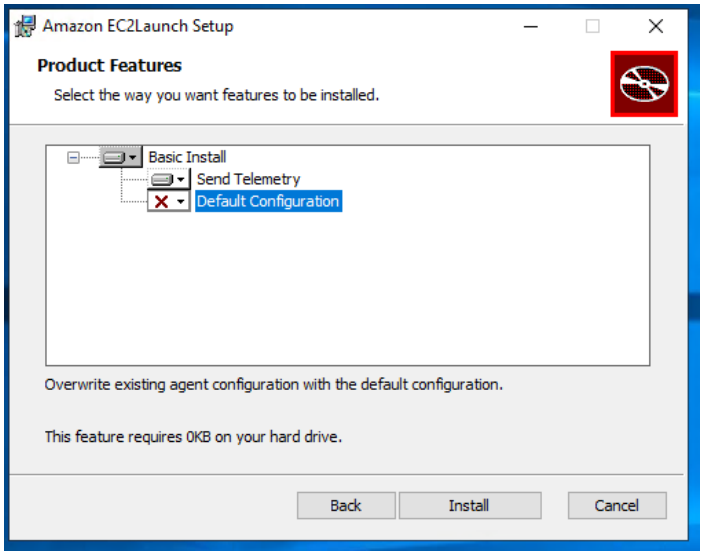
When you install or upgrade EC2Launch v2, you can configure the following installation options through the EC2Launch v2 install dialog.

Basic Install options

Send Telemetry

When you include this feature in the setup dialog, the installer sets the EC2LAUNCH_TELEMETRY environment variable to a value of 1. If you disable **Send Telemetry**, the installer sets the environment variable to a value of 0.

When the EC2Launch v2 agent runs, it reads the EC2LAUNCH_TELEMETRY environment variable to determine whether to upload telemetry data. If the value equals 1, it uploads the data. Otherwise, it doesn't upload.



Default configuration

The default configuration for EC2Launch v2 is to overwrite the local launch agent if it exists already. The first time you run an install on an instance, the default configuration performs a clean install. If you disable the default configuration on the initial install, the installation fails.

If you run the install again on the instance, you can disable the default configuration to perform an upgrade that doesn't replace the %ProgramData%/Amazon/EC2Launch/config/agent-config.yml file.

Example: Upgrade EC2Launch v2 with telemetry

The following example shows the EC2Launch v2 setup dialog configured to upgrade the current installation and enable telemetry. This configuration performs an install without replacing the agent configuration file, and sets the EC2LAUNCH_TELEMETRY environment variable to a value of 1.

Command line

When you install or upgrade EC2Launch v2, you can configure the following installation options with the **msiexec** command in a command line shell.

`ADDLOCAL` parameter values

Basic (required)

Install the launch agent. If this value is not present in the `ADDLOCAL` parameter, the installation ends.

Clean

When you include the `Clean` value in the `ADDLOCAL` parameter, the installer writes the agent configuration file to the following location: `%ProgramData%/Amazon/EC2Launch/config/agent-config.yml`. If the agent configuration file already exists, it overwrites the file.

When you leave the `Clean` value out of the `ADDLOCAL` parameter, the installer performs an upgrade that doesn't replace the agent configuration file.

Telemetry

When you include the `Telemetry` value in the `ADDLOCAL` parameter, the installer sets the `EC2LAUNCH_TELEMETRY` environment variable to a value of `1`.

When you leave the `Telemetry` value out of the `ADDLOCAL` parameter, the installer sets the environment variable to a value of `0`.

When the EC2Launch v2 agent runs, it reads the EC2LAUNCH_TELEMETRY environment variable to determine whether to upload telemetry data. If the value equals 1, it uploads the data. Otherwise, it doesn't upload.

Example: install EC2Launch v2 with telemetry

```
& msiexec /i "C:\Users\Administrator\Desktop\EC2Launchv2\AmazonEC2Launch.msi"
 ADDLOCAL="Basic,Clean,Telemetry" /q
```

Verify the EC2Launch v2 version

Use one of the following procedures to verify the version of EC2Launch v2 that is installed on your instances.

PowerShell

Verify the installed version of EC2Launch v2 with Windows PowerShell, as follows.

1. Launch an instance from your AMI and connect to it.
2. Run the following command in PowerShell to verify the installed version of EC2Launch v2:

```
& "C:\Program Files\Amazon\EC2Launch\EC2Launch.exe" version
```

Windows Control Panel

Verify the installed version of EC2Launch v2 in the Windows Control Panel, as follows.

1. Launch an instance from your AMI and connect to it.
2. Open the Windows Control Panel and choose **Programs and Features**.
3. Look for `Amazon EC2Launch` in the list of installed programs. Its version number appears in the **Version** column.

To view the latest updates for the AWS Windows AMIs, see Windows AMI version history in the *AWS Windows AMI Reference*.

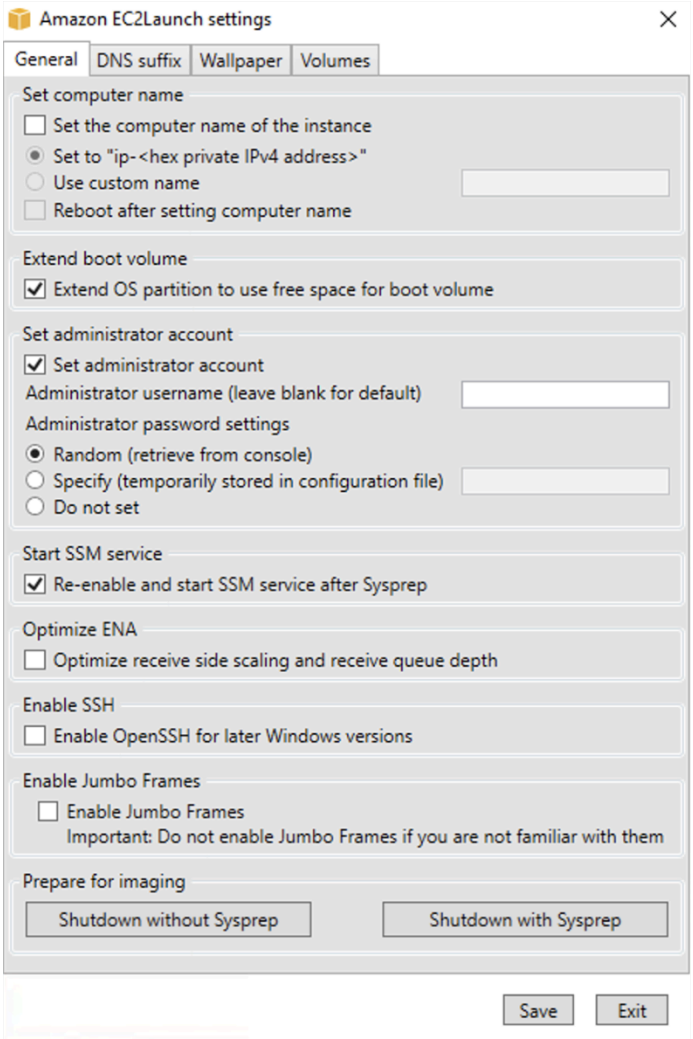
For the latest version of EC2Launch v2, see EC2Launch v2 version history.

You can receive notifications when new versions of the EC2Launch v2 service are released. For more information, see Subscribe to EC2 Windows launch agent notifications.

Configure EC2Launch v2 settings for Windows instances

This section contains information about how to configure settings for EC2Launch v2.

Topics include:



- Change settings using the EC2Launch v2 settings dialog box
- Configure EC2Launch v2 using the CLI
- EC2Launch v2 task configuration
- EC2Launch v2 exit codes and reboots
- EC2Launch v2 and Sysprep

Change settings using the EC2Launch v2 settings dialog box

The following procedure describes how to use the EC2Launch v2 settings dialog box to enable or disable settings.

> **Note**
>
> If you improperly configure custom tasks in the agent-config.yml file, and you attempt to open the Amazon EC2Launch settings dialog box, you will receive an error. For example schema, see Example: `agent-config.yml`.

1. Launch and connect to your Windows instance.
2. From the Start menu, choose **All Programs**, and then navigate to **EC2Launch settings**. Before you choose **Shutdown with Sysprep** or **Shutdown without Sysprep**, make sure that you save any changes that you want to apply when you run the shutdown.

3. On the **General** tab of the **EC2Launch settings** dialog box, you can enable or disable the following settings.

   a. **Set Computer Name**

      If this setting is enabled (it is disabled by default), the current host name is compared to the desired host name at each boot. If the host names do not match, the host name is reset, and the system then optionally reboots to pick up the new host name. If a custom host name is not specified, it is generated using the hexadecimal-formatted private IPv4 address, for example, `ip-AC1F4E6`. To prevent your existing host name from being modified, do not enable this setting.

   b. **Extend Boot Volume**

      This setting dynamically extends `Disk 0/Volume 0` to include any unpartitioned space. This can be useful when the instance is booted from a root volume that has a custom size.

c. **Set Administrator Account**

When enabled, you can set the username and password attributes for the administrator account that is created on your local machine. If this feature is not enabled, an administrator account is not created on the system following Sysprep. Provide a password in `adminPassword` only if `adminPasswordtype` is `Specify`.

The password types are defined as follows:

i. `Random`

EC2Launch generates a password and encrypts it using the user's key. The system disables this setting after the instance is launched so that this password persists if the instance is rebooted or stopped and started.

ii. `Specify`

EC2Launch uses the password that you specify in `adminPassword`. If the password does not meet the system requirements, EC2Launch generates a random password instead. The password is stored in `agent-config.yml` as clear text and is deleted after Sysprep sets the administrator password. EC2Launch encrypts the password using the user's key.

iii. `Do not set`

EC2Launch uses the password that you specify in the unattend.xml file. If you don't specify a password in unattend.xml, the administrator account is disabled.

d. **Start SSM Service**

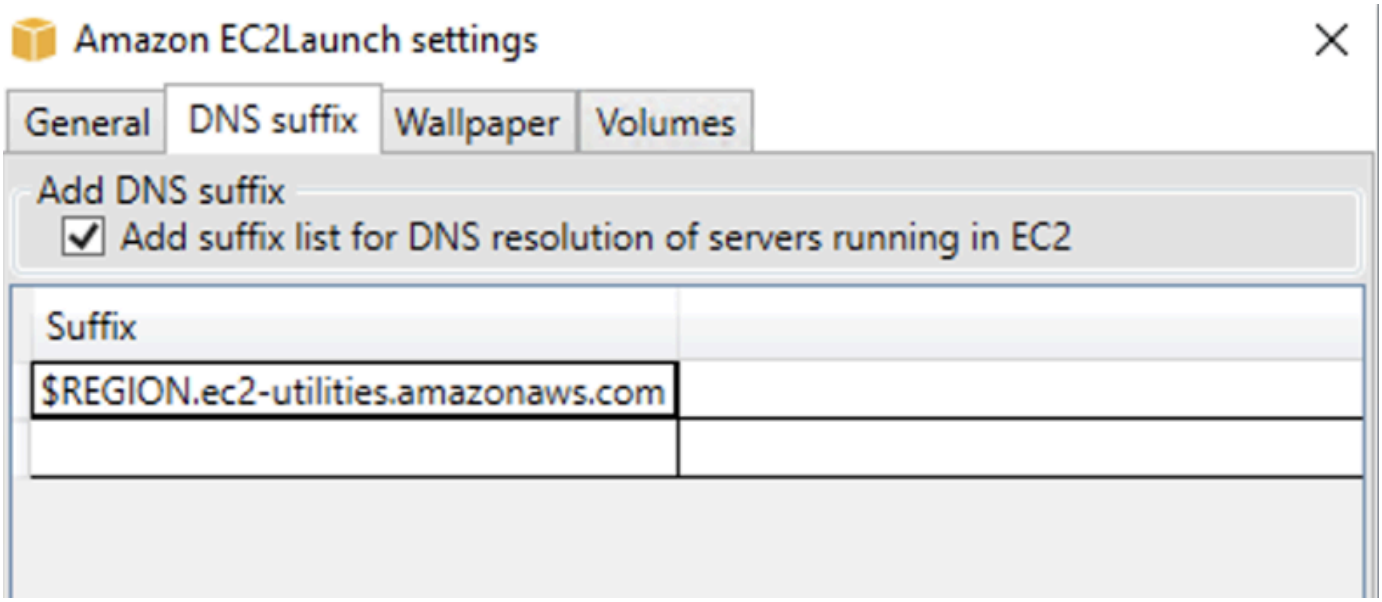
When selected, the Systems Manager service is enabled to start following Sysprep. EC2Launch v2 performs all of the tasks described earlier, and the SSM Agent processes requests for Systems Manager capabilities, such as Run Command and State Manager.

e. **Optimize ENA**

When selected, ENA settings are configured to ensure that ENA Receive Side Scaling and Receive Queue Depth settings are optimized for AWS. For more information, see Configure Receive side scaling CPU affinity.

f. **Enable SSH**

This setting enables OpenSSH for later Windows versions to allow for remote system administration.



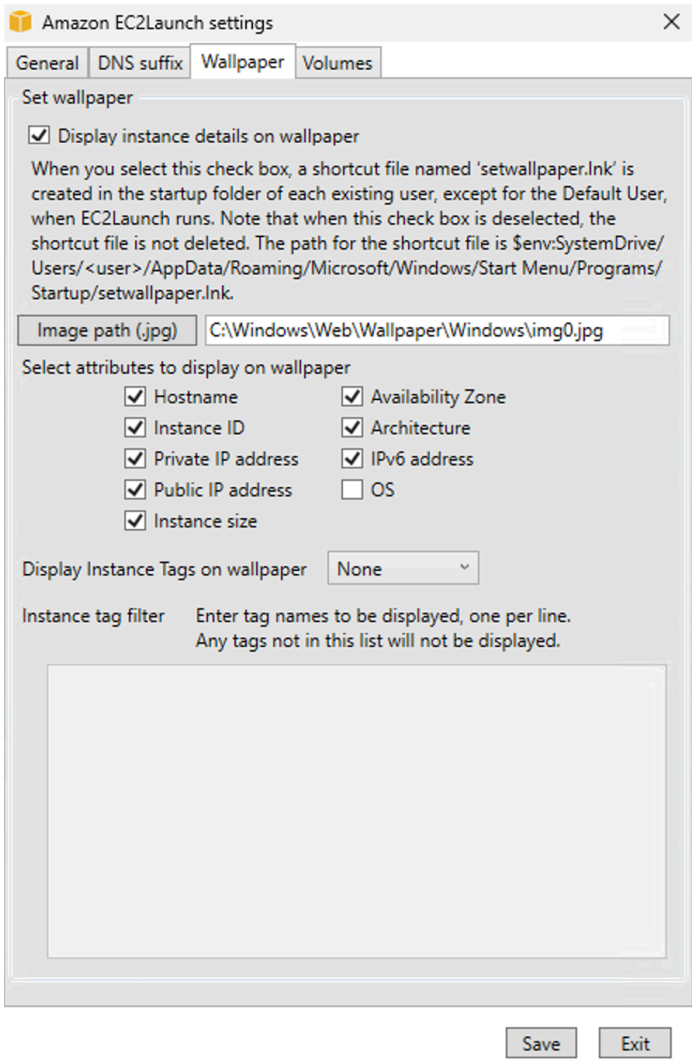
g. **Enable Jumbo Frames**

Select to enable Jumbo Frames. Jumbo Frames can have unintended effects on your network communications, so ensure you understand how Jumbo Frames will impact your system before enabling. For more information about Jumbo Frames, see Jumbo frames (9001 MTU).

h. **Prepare for Imaging**

Select whether you want your EC2 instance to shut down with or without Sysprep. When you want to run Sysprep with EC2Launch v2, choose **Shutdown with Sysprep**.

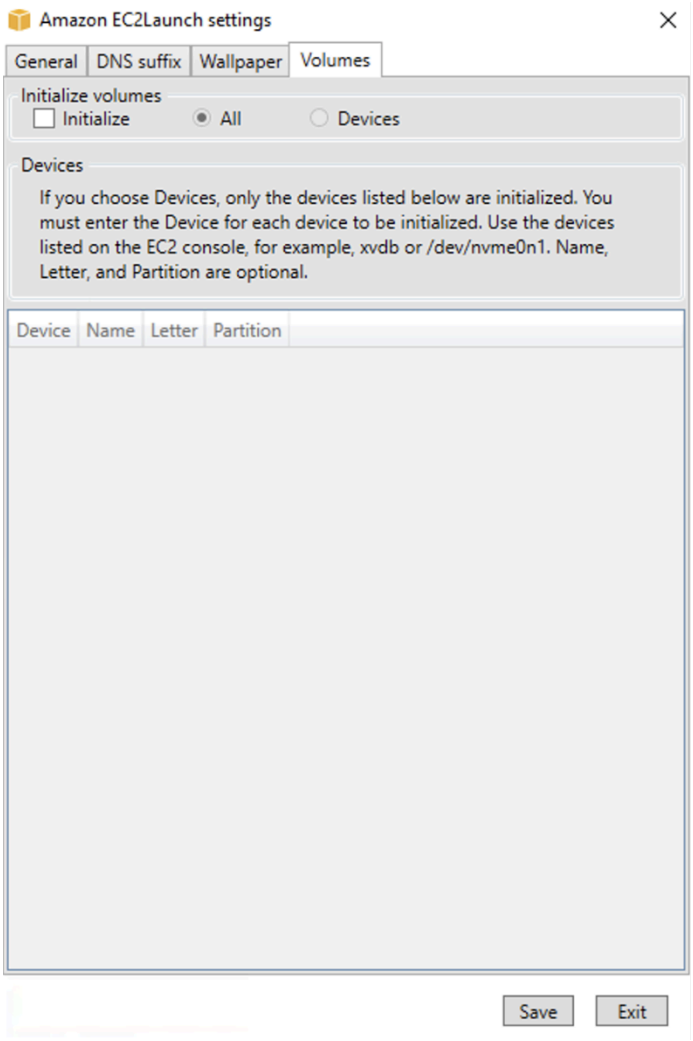
4. On the **DNS Suffix** tab, you can select whether you want to add a DNS suffix list for DNS resolution of servers running in EC2, without providing the fully qualified domain name. DNS suffixes can contain the variables `$REGION` and `$AZ`. Only suffixes that do not already exist will be added to the list.



5. On the **Wallpaper** tab, you can configure your instance wallpaper with a background image, and specify instance details for the wallpaper to display. Amazon EC2 generates the details each time you log in.

You can configure your wallpaper with the following controls.

- **Display instance details on wallpaper** – This checkbox activates or deactivates instance detail display on the wallpaper.
- **Image path (.jpg)** – Specify the path to the image to use as the wallpaper background.
- **Select attributes to display on wallpaper** – Select the check boxes for the instance details that you want to appear on the wallpaper. Clear the check boxes for previously selected instance details that you want to remove from the wallpaper.
- **Display Instance Tags on wallpaper** – Select one of the following settings to display instance tags on the wallpaper:
  - **None** – Don't display any instance tags on the wallpaper.
  - **Show all** – Display all instance tags on the wallpaper.
  - **Show filtered** – Display specified instance tags on the wallpaper. When you select this setting, you can add instance tags that you want to display on your wallpaper in the **Instance tag filter** box.



> **Note**
>
> You must enable tags in metadata to show tags on the wallpaper. For more information about instance tags and metadata, see View tags for your EC2 instances using instance metadata.

6. On the **Volumes** tab, select whether you want to initialize the volumes that are attached to the instance. Enabling sets drive letters for any additional volumes and extends them to use available space. If you select **All**, all of the storage volumes are initialized. If you select **Devices**, only devices that are specified in the list are initialized. You must enter the device for each device to be initialized. Use the devices listed on the EC2 console, for example, `xvdb` or `/dev/nvme0n1`. The dropdown list displays the storage volumes that are attached to the instance. To enter a device that is not attached to the instance, enter it in the text field.

   Name, **Letter**, and **Partition** are optional fields. If no value is specified for **Partition**, storage volumes larger than 2 TB are initialized with the `gpt` partition type, and those smaller than 2 TB are initialized with the `mbr` partition type. If devices are configured, and a non-NTFS device

either contains a partition table, or the first 4 KB of the disk contain data, then the disk is skipped and the action logged.

Configure EC2Launch v2 using the CLI

You can use the Command Line Interface (CLI) to configure your EC2Launch settings and manage the service. The following section contains descriptions and usage information for the CLI commands that you can use to manage EC2Launch v2.

> **Note**
>
> The EC2Launch v2 CLI executable, `EC2Launch.exe`, resides in `C:\Program Files\Amazon\EC2Launch\`. By default, this directory is not in the Windows PATH. The `ec2launch` *`command`* form shown in the examples in this section is shorthand that a shell does not recognize directly. To run a command, use the full path to the executable, or first

change to the installation directory. The following PowerShell example uses the full path with the call operator:

```
& "C:\Program Files\Amazon\EC2Launch\EC2Launch.exe" status
```

Commands

- collect-logs
- get-agent-config
- list-volumes
- reset
- run
- status
- sysprep
- validate
- version
- wallpaper

collect-logs

Collects log files for EC2Launch, zips the files, and places them in a specified directory.

Example

```
ec2launch collect-logs -o C:\Mylogs.zip
```

Usage

`ec2launch collect-logs [flags]`

Flags

`-h, --help`

help for `collect-logs`

`-o, --output string`

path to zipped output log files

get-agent-config

Prints `agent-config.yml` in the format specified (JSON or YAML). If no format is specified, `agent-config.yml` is printed in the format previously specified.

Example

```
ec2launch get-agent-config -f json
```

Usage

`ec2launch get-agent-config [flags]`

Flags

`-h`, `--help`

help for `get-agent-config`

`-f`, `--format string`

output format of `agent-config` file: `json`, `yaml`

list-volumes

Lists all of the storage volumes attached to the instance, including ephemeral and EBS volumes.

Example

```
ec2launch list-volumes
```

Usage

`ec2launch list-volumes`

Flags

`-h`, `--help`

help for `list-volumes`

reset

The main goal of this task is to reset the agent for the next time that it runs. To do that, the **reset** command deletes all of the agent state data for EC2Launch v2 from the local `EC2Launch` directory (see EC2Launch v2 directory structure). Reset optionally deletes the service and Sysprep logs.

Script behavior depends on what mode the agent runs the scripts in – inline, or detached.

Inline (default)

The EC2Launch v2 agent runs scripts one at a time (`detach: false`). This is the default setting.

> **Note**
>
> When your inline script issues a **reset** or **sysprep** command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.
> For example, if the task that issues the command would have been followed by a `startSsm` task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.

Detached

The EC2Launch v2 agent runs scripts concurrently with other tasks (`detach: true`).

> **Note**
>
> When your detached script issues a **reset** or **sysprep** command, those commands wait for the agent to finish before they run. Tasks after the executeScript will still run.

Example

```
ec2launch reset -c
```

Usage

```
ec2launch reset [flags]
```

Flags

`-c`, `--clean`

cleans instance logs before `reset`

`-h`, `--help`

help for `reset`

run

Runs EC2Launch v2.

Example

```
ec2launch run
```

Usage

`ec2launch run [flags]`

Flags

`-h`, `--help`

help for `run`

status

Gets the status of the EC2Launch v2 agent. Optionally blocks the process until the agent is finished. The process exit code determines the agent state:

- `0` –the agent ran and was successful.
- `1` – the agent ran and failed.
- `2` – the agent is still running.
- `3` – the agent is in an unknown state. The agent state is not running or stopped.
- `4` – an error occurred when attempting to retrieve the agent state.
- `5` – the agent is not running and the status of the last known run is unknown. This could mean one of the following:
  - both the `state.json` and `previous-state.json` are deleted.

- the `previous-state.json` is corrupted.

This is the agent state after running the `reset` command.

Example:

```
ec2launch status -b
```

> **Note**
>
> The `status` command writes a short message to the console (for example, `agent ran successfully`). However, the process exit code values listed previously determine the agent state, not that message. To view the exit code in PowerShell, read the `$LASTEXITCODE` automatic variable after you run the command, for example:
>
> ```
> & "C:\Program Files\Amazon\EC2Launch\EC2Launch.exe" status; "ExitCode=
> $LASTEXITCODE"
> ```
>
> An output of `ExitCode=0` indicates that the agent ran successfully.

Usage

`ec2launch status [flags]`

Flags

`-b,--block`

blocks the process until the agent finishes running

`-h,--help`

help for `status`

sysprep

The main goal of this task is to reset the agent for the next time that it runs. To do that, the **sysprep** command resets the agent state, updates the `unattend.xml` file, disables RDP, and runs Sysprep.

Script behavior depends on what mode the agent runs the scripts in – inline, or detached.

Inline (default)

The EC2Launch v2 agent runs scripts one at a time (`detach: false`). This is the default setting.

> **Note**
>
> When your inline script issues a **reset** or **sysprep** command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.
> For example, if the task that issues the command would have been followed by a `startSsm` task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.

Detached

The EC2Launch v2 agent runs scripts concurrently with other tasks (`detach: true`).

> **Note**
>
> When your detached script issues a **reset** or **sysprep** command, those commands wait for the agent to finish before they run. Tasks after the executeScript will still run.

Example:

```
ec2launch sysprep
```

Usage

`ec2launch sysprep [flags]`

Flags

`-c,--clean`

cleans instance logs before `sysprep`

`-h,--help`

help for Sysprep

`-s,--shutdown`

shuts down the instance after `sysprep`

validate

Validates the `agent-config` file `C:\ProgramData\Amazon\EC2Launch\config\agent-config.yml`.

Example

```
ec2launch validate
```

Usage

```
ec2launch validate [flags]
```

Flags

`-h , --help`

help for `validate`

version

Gets the executable version.

Example

```
ec2launch version
```

Usage

```
ec2launch version [flags]
```

Flags

`-h, --help`

help for `version`

wallpaper

Sets new wallpaper to the wallpaper path that is provided (.jpg file), and displays the selected instance details.

Syntax

```
ec2launch wallpaper ^
--path="C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg" ^
--all-tags ^
--
attributes=hostName,instanceId,privateIpAddress,publicIpAddress,ipv6Address,instanceSize,availa
```

Inputs

Parameters

--allowed-tags [*tag-name-1*, *tag-name-n*]

(Optional) Base64 encoded JSON array of instance tag names to display on the wallpaper. You can use this tag or the `--all-tags`, but not both.

--attributes *attribute-string-1*, *attribute-string-n*

(Optional) A comma-separated list of `wallpaper` attribute strings to apply settings to the wallpaper.

[--path | -p] *path-string*

(Required) Specifies the `wallpaper` background image file path.

Flags

--all-tags

(Optional) Displays all of the instance tags on the wallpaper. You can use this tag or the `--allowed-tags`, but not both.

[--help | -h]

Displays help for the **wallpaper** command.

EC2Launch v2 task configuration

This section includes the configuration schema, tasks, details, and examples for `agent-config.yml` and user data.

Tasks and examples

- Schema: agent-config.yml
- Configure EC2Launch v2 user data scripts that run during launch or reboot

Schema: `agent-config.yml`

The structure of the `agent-config.yml` file is shown below. Note that a task cannot be repeated in the same stage. For task properties, see the task descriptions that follow.

Document structure: agent-config.yml

JSON

```
{
 "version": "1.1",
 "config": [
  {
   "stage": "string",
   "tasks": [
    {
     "task": "string",
     "inputs": {
      ...
     }
    },
    ...
   ]
  },
  ...
 ]
}
```

YAML

```
version: 1.1
```

```
config:
- stage: string
  tasks:
  - task: string
 inputs:
   ...
  ...
...
```

Example: `agent-config.yml`

The following example shows settings for the `agent-config.yml` configuration file.

```
version: 1.1
config:
- stage: boot
  tasks:
  - task: extendRootPartition
- stage: preReady
  tasks:
  - task: activateWindows
    inputs:
      activation:
        type: amazon
  - task: setDnsSuffix
    inputs:
      suffixes:
      - $REGION.ec2-utilities.amazonaws.com
  - task: setAdminAccount
    inputs:
      password:
        type: random
  - task: setWallpaper
    inputs:
      path: C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg
      attributes:
      - hostName
      - instanceId
      - privateIpAddress
      - publicIpAddress
      - instanceSize
      - availabilityZone
      - architecture
- stage: postReady
```

```
  tasks:
  - task: startSsm
```

Configure EC2Launch v2 user data scripts that run during launch or reboot

The following JSON and YAML examples show the document structure for user data. Amazon EC2 parses each task named in the `tasks` array that you specify in the document. Each task has its own set of properties and requirements. For details, see the Task definitions for EC2Launch v2 startup tasks.

> **Note**
>
> A task must only appear once in the user data tasks array.

Document structure: user data

JSON

```
{
 "version": "1.1",
 "tasks": [
  {
   "task": "string",
   "inputs": {
    ...
   },
  },
  ...
 ]
}
```

YAML

```
version: 1.1
tasks:
- task: string
  inputs:
    ...
...
```

Example: user data

For more information about user data, see How Amazon EC2 handles user data for Windows instances.

The following YAML document example shows a PowerShell script that EC2Launch v2 runs as user data to create a file.

```
version: 1.1
tasks:
- task: executeScript
  inputs:
  - frequency: always
    type: powershell
    runAs: localSystem
    content: |-
      New-Item -Path 'C:\PowerShellTest.txt' -ItemType File
```

You can use an XML format for the user data that's compatible with previous versions of the launch agent. EC2Launch v2 runs the script as an `executeScript` task in the `UserData` stage. To conform with EC2Launch v1 and EC2Config behavior, the user data script runs as an attached/inline process by default.

You can add optional tags to customize how your script runs. For example, to run the user data script when the instance reboots in addition to one time when the instance launches, you can use the following tag:

`<persist>true</persist>`

Example:

```
<powershell>
  $file = $env:SystemRoot + "\Temp" + (Get-Date).ToString("MM-dd-yy-hh-mm")
  New-Item $file -ItemType file
</powershell>
<persist>true</persist>
```

You can specify one or more PowerShell arguments with the `<powershellArguments>` tag. If no arguments are passed, EC2Launch v2 adds the following argument by default: `-ExecutionPolicy Unrestricted`.

Example:

```
<powershell>
  $file = $env:SystemRoot + "\Temp" + (Get-Date).ToString("MM-dd-yy-hh-mm")
  New-Item $file -ItemType file
</powershell>
<powershellArguments>-ExecutionPolicy Unrestricted -NoProfile -NonInteractive</
powershellArguments>
```

To run an XML user data script as a detached process, add the following tag to your user data.

```
<detach>true</detach>
```

Example:

```
<powershell>
  $file = $env:SystemRoot + "\Temp" + (Get-Date).ToString("MM-dd-yy-hh-mm")
  New-Item $file -ItemType file
</powershell>
<detach>true</detach>
```

> **Note**
>
> The detach tag is not supported on previous launch agents.

Change log: user data

The following table lists changes for user data, and cross-references them to the EC2Launch v2 agent version that applies.

User data version	Details	Introduced in
1.1	• User data tasks run before the `PostReady` stage in the agent config file. • Runs user data before starting the Systems Manager Agent (same behavior as EC2Launch v1 and EC2Config).*	EC2Launch v2 version 2.0.1245

User data version	Details	Introduced in
1.0	• Will be deprecated. • User data tasks run after the `PostReady` stage in the agent config file. This is not backwards compatible with EC2Launch v1. • Impacted by a race condition between Systems Manager Agent start and user data tasks.	EC2Launch v2 version 2.0.0

* When used with the default `agent-config.yml` file.

EC2Launch v2 exit codes and reboots

You can use EC2Launch v2 to define how exit codes are handled by your scripts. By default, the exit code of the last command that is run in a script is reported as the exit code for the entire script. For example, if a script includes three commands and the first command fails but the following ones succeed, the run status is reported as `success` because the final command succeeded.

If you want a script to reboot an instance, then you must specify `exit 3010` in your script, even when the reboot is the last step in your script. `exit 3010` instructs EC2Launch v2 to reboot the instance and call the script again until it returns an exit code that is not `3010`, or until the maximum reboot count has been reached. EC2Launch v2 permits a maximum of 5 reboots per task. If you attempt to reboot an instance from a script by using a different mechanism, such as `Restart-Computer`, then the script run status will be inconsistent. For example, it may get stuck in a restart loop or not perform the restart.

If you are using an XML user data format that is compatible with older agents, the user data may run more times than you intend it to. For more information, see Service runs user data more than once in the Troubleshooting section.

EC2Launch v2 and Sysprep

The EC2Launch v2 service runs Sysprep, a Microsoft tool that enables you to create a customized Windows AMI that can be reused. When EC2Launch v2 calls Sysprep, it uses the files in

`%ProgramData%\Amazon\EC2Launch` to determine which operations to perform. You can edit these files indirectly using the **EC2Launch settings** dialog box, or directly using a YAML editor or a text editor. However, there are some advanced settings that aren't available in the **EC2Launch settings** dialog box, so you must edit those entries directly.

If you create an AMI from an instance after updating its settings, the new settings are applied to any instance that's launched from the new AMI. For information about creating an AMI, see Create an Amazon EBS-backed AMI.

Task definitions for EC2Launch v2 startup tasks

Each task that EC2Launch v2 runs during launch or startup has its own set of properties and requirements. Task details include settings for how often a task runs – once, or always, what stage of the agent boot process it runs in, syntax, and YAML document examples. For more information, review the task details shown in this reference.

EC2Launch v2 Tasks

- activateWindows
- enableJumboFrames
- enableOpenSsh
- executeProgram
- executeScript
- extendRootPartition
- initializeVolume
- optimizeEna
- setAdminAccount
- setDnsSuffix
- setHostName
- setWallpaper
- startSsm
- sysprep
- writeFile

activateWindows

Activates Windows against a set of AWS KMS servers. Activation is skipped if the instance is detected as Bring-Your-Own-License (BYOL).

Frequency — once

AllowedStages — `[PreReady]`

Inputs —

`activation`: (map)

`type`: (string) activation type to use, set to `amazon`

Example

```
task: activateWindows
  inputs:
    activation:
    type: amazon
```

enableJumboFrames

Enables Jumbo Frames, which increase the maximum transmission unit (MTU) of the network adapter. For more information, see Jumbo frames (9001 MTU).

Frequency — always

AllowedStages — `[PostReady, UserData]`

Inputs — none

Example

```
task: enableJumboFrames
```

enableOpenSsh

Enables Windows OpenSSH and adds the public key for the instance to the authorized keys folder.

Frequency — once

AllowedStages — `[PreReady, UserData]`

Inputs — none

Example

The following example shows how to enable OpenSSH on an instance, and to add the public key for the instance to the authorized keys folder. This configuration works only on instances running Windows Server 2019 and later versions.

```
task: enableOpenSsh
```

executeProgram

Runs a program with optional arguments and a specified frequency.

Stages: You can run the `executeProgram` task during the `PreReady`, `PostReady`, and `UserData` stages.

Frequency: configurable, see *Inputs*.

Inputs

This section contains one or more programs for the **executeProgram** task to run (inputs). Each input can include the following configurable settings:

frequency (string)

(Required) Specify exactly one of the following values:

- `once`
- `always`

path (string)

(Required) The file path for the executable to run.

arguments (list of strings)

(Optional) A comma separated list of arguments to provide to the program as input.

runAs (string)

(Required) Must be set to `localSystem`

Output

All of the tasks write logfile entries to the `agent.log` file. Additional output from the `executeProgram` task is stored separately in a dynamically named folder, as follows:

`%LocalAppData%\Temp\`*`EC2Launch#########`*`\`*`outputfilename.tmp`*

The exact path to the output files is included in the `agent.log` file, for example:

```
Program file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\ExecuteProgramInputs.tmp
Output file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\Output.tmp
Error file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\Err.tmp
```

Output files for the `executeProgram` task

`ExecuteProgramInputs.tmp`

Contains the path for the executable, and all of the input parameters that the `executeProgram` task passes to it when it runs.

`Output.tmp`

Contains runtime output from the program that the `executeProgram` task runs.

`Err.tmp`

Contains runtime error messages from the program that the `executeProgram` task runs.

Examples

The following examples show how to run an executable file from a local directory on an instance with the `executeProgram` task.

Example 1: Setup executable with one argument

This example shows an `executeProgram` task that runs a setup executable in quiet mode.

```
task: executeProgram
  inputs:
```

```
    - frequency: always
      path: C:\Users\Administrator\Desktop\setup.exe
      arguments: ['-quiet']
```

Example 2: VLC executable with two arguments

This example shows an `executeProgram` task that runs a VLC executable file with two arguments passed as input parameters.

```
task: executeProgram
  inputs:
    - frequency: always
      path: C:\vlc-3.0.11-win64.exe
      arguments: ['/L=1033','/S']
      runAs: localSystem
```

executeScript

Runs a script with optional arguments and a specified frequency. Script behavior depends on what mode the agent runs the scripts in – inline, or detached.

Inline (default)

The EC2Launch v2 agent runs scripts one at a time (`detach: false`). This is the default setting.

> **Note**
>
> When your inline script issues a **reset** or **sysprep** command, it runs immediately and resets the agent. The current task finishes, then the agent shuts down without running any further tasks.
> For example, if the task that issues the command would have been followed by a `startSsm` task (included by default after user data runs), the task doesn't run and the Systems Manager service never starts.

Detached

The EC2Launch v2 agent runs scripts concurrently with other tasks (`detach: true`).

> **Note**
>
> When your detached script issues a **reset** or **sysprep** command, those commands wait for the agent to finish before they run. Tasks after the executeScript will still run.

Stages: You can run the `executeScript` task during the `PreReady`, `PostReady`, and `UserData` stages.

Frequency: configurable, see *Inputs*.

Inputs

This section contains one or more scripts for the **executeScript** task to run (inputs). Each input can include the following configurable settings:

frequency (string)

(Required) Specify exactly one of the following values:

- `once`
- `always`

type (string)

(Required) Specify exactly one of the following values:

- `batch`
- `powershell`

arguments (list of strings)

(Optional) A list of string arguments to pass to the shell (not to the PowerShell script). This parameter isn't supported for `type: batch`. If no arguments are passed, EC2Launch v2 adds the following argument by default: `-ExecutionPolicy Unrestricted`.

content (string)

(Required) Script content.

runAs (string)

(Required) Specify exactly one of the following values:

- admin
- localSystem

detach (Boolean)

(Optional) The EC2Launch v2 agent defaults to run scripts one at a time (detach: false). To run the script concurrently with other tasks, set the value to true (detach: true).

> **Note**
>
> Script exit codes (including 3010) have no effect when detach is set to true.

Output

All of the tasks write logfile entries to the agent.log file. Additional output from script that the executeScript task runs is stored separately in a dynamically named folder, as follows:

%LocalAppData%\Temp*EC2Launch#########**outputfilename.ext*

The exact path to the output files is included in the agent.log file, for example:

```
Program file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\UserScript.ps1
Output file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\Output.tmp
Error file is created at: C:\Windows\system32\config\systemprofile\AppData\Local
\Temp\EC2Launch123456789\Err.tmp
```

Output files for the executeScript task

UserScript.*ext*

Contains the script that the executeScript task ran. The file extension depends on the type of script you specified in the type parameter for the executeScript task, as follows:

- If the type is batch, then the file extension is .bat.
- If the type is powershell, then the file extension is .ps1.

Output.tmp

Contains runtime output from the script that the executeScript task runs.

`Err.tmp`

Contains runtime error messages from the script that the `executeScript` task runs.

Examples

The following examples show how to run an inline script with the `executeScript` task.

Example 1: Hello world output text file

This example shows an `executeScript` task that runs a PowerShell script to create a "Hello world" text file on the `C:` drive.

```
task: executeScript
  inputs:
    - frequency: always
      type: powershell
      runAs: admin
      content: |-
        New-Item -Path 'C:\PowerShellTest.txt' -ItemType File
        Set-Content 'C:\PowerShellTest.txt' "Hello world"
```

Example 2: Run two scripts

This example shows that the `executeScript` task can run more than one script, and the script type doesn't necessarily need to match.

The first script (`type: powershell`) writes a summary of the processes that are currently running on the instance to a text file located on the `C:` drive.

The second script (`batch`) writes the system information to the `Output.tmp` file.

```
task: executeScript
  inputs:
    - frequency: always
      type: powershell
      runAs: localSystem
      content: |
        Get-Process | Out-File -FilePath C:\Process.txt
    - frequency: always
      type: batch
      runAs: localSystem
```

```
      content: |
        systeminfo
```

Example 3: Idempotent system configuration with reboots

This example shows an `executeScript` task that runs an idempotent script to perform the following system configuration with a reboot between each step:

- Rename the computer.
- Join the computer to the domain.
- Enable Telnet.

The script ensures that each operation runs one time only. This prevents a reboot loop and makes the script idempotent.

```
task: executeScript
  inputs:
    - frequency: always
      type: powershell
      runAs: localSystem
      content: |-
        $name = $env:ComputerName
        if ($name -ne $desiredName) {
          Rename-Computer -NewName $desiredName
          exit 3010
        }
        $domain = Get-ADDomain
        if ($domain -ne $desiredDomain)
        {
          Add-Computer -DomainName $desiredDomain
          exit 3010
        }
        $telnet = Get-WindowsFeature -Name Telnet-Client
        if (-not $telnet.Installed)
        {
          Install-WindowsFeature -Name "Telnet-Client"
          exit 3010
        }
```

extendRootPartition

Extends the root volume to use all of the available space on the disk.

Frequency — once

AllowedStages — `[Boot]`

Inputs — none

Example

```
task: extendRootPartition
```

initializeVolume

Initializes empty volumes that are attached to the instance so that they're activated and partitioned. The launch agent skips initialization if it detects that the volume is not empty. A volume is considered empty if the first 4 KiB of the volume are empty, or if the volume doesn't have a Windows-recognizable drive layout.

The `letter` input parameter is always applied when this task runs, regardless of whether the drive is already initialized.

The `initializeVolume` task performs the following actions.

- Set disk attributes `offline` and `readonly` to false.
- Create a partition. If no partition type is specified in the `partition` input parameter, the following defaults apply:
  - If the disk size is smaller than 2 TB, set the partition type to `mbr`.
  - If the disk size is 2 TB or larger, set the partition type to `gpt`.
- Format the volume as NTFS.
- Set the volume label as follows:
  - Use the value of the `name` input parameter, if specified.
  - If the volume is ephemeral, and no name was specified, set the volume label to `Temporary Storage Z`.
- If the volume is ephemeral (SSD or HDD – not Amazon EBS), create an `Important.txt` file at the root of the volume with the following content:

```
This is an 'Instance Store' disk and is provided at no additional charge.

*This disk offers increased performance since it is local to the host
```

```
*The number of Instance Store disks available to an instance vary by instance type
*DATA ON THIS DRIVE WILL BE LOST IN CASES OF IMPAIRMENT OR STOPPING THE INSTANCE.
 PLEASE ENSURE THAT ANY IMPORTANT DATA IS BACKED UP FREQUENTLY

For more information, please refer to: Instance store temporary block storage for EC2
 instances.
```

- Set the drive letter to the value specified in the `letter` input parameter.

Stages: You can run the `initializeVolume` task during the `PostReady` and `UserData` stages.

Frequency: always.

Inputs

You can configure runtime parameters as follows:

devices (list of maps)

(Conditional) Configuration for each device that the launch agent initializes. This is required if the `initialize` input parameter is set to `devices`.

- **device (string, required)** – Identifies the device during instance creation. For example, `xvdb`, `xvdf`, or `\dev\nvme0n1`.
- **letter (string, optional)** – One character. The drive letter to assign.
- **name (string, optional)** – The volume name to assign.
- **partition (string, optional)** – Specify one of the following values for the type of partition to create, or let the launch agent default based on volume size:
  - mbr
  - gpt

initialize (string)

(Required) Specify exactly one of the following values:

- `all`
- `devices`

Examples

The following examples show sample input configurations for the `initializeVolume` task.

Example 1: Initialize two volumes on an instance

This example shows an `initializeVolume` task that initializes two secondary volumes on an instance. The device named `DataVolume2` in the example is ephemeral.

```
task: initializeVolume
inputs:
  initialize: devices
  devices:
  - device: xvdb
    name: DataVolume1
    letter: D
    partition: mbr
  - device: /dev/nvme0n1
    name: DataVolume2
    letter: E
    partition: gpt
```

Example 2: Initialize EBS volumes attached to an instance

This example shows an `initializeVolume` task that initializes all empty EBS volumes that are attached to the instance.

```
task: initializeVolume
inputs:
  initialize: all
```

optimizeEna

Optimizes ENA settings based on the current instance type; might reboot the instance.

Frequency — always

AllowedStages — `[PostReady, UserData]`

Inputs — none

Example

```
task: optimizeEna
```

setAdminAccount

Sets attributes for the default administrator account that is created on the local machine.

Frequency — once

AllowedStages — `[PreReady]`

Inputs —

`name`: (string) name of the administrator account

`password`: (map)

`type`: (string) strategy to set the password, either as `static`, `random`, or `doNothing`

`data`: (string) stores data if the `type` field is static

Example

```
task: setAdminAccount
inputs:
  name: Administrator
  password:
  type: random
```

setDnsSuffix

Adds DNS suffixes to the list of search suffixes. Only suffixes that do not already exist are added to the list. For more information about how launch agents set DNS suffixes, see Configure DNS Suffix for EC2 Windows launch agents.

Frequency — always

AllowedStages — `[PreReady]`

Inputs —

`suffixes`: (list of strings) list of one or more valid DNS suffixes; valid substitution variables are `$REGION` and `$AZ`

Example

```
task: setDnsSuffix
inputs:
  suffixes:
  - $REGION.ec2-utilities.amazonaws.com
```

setHostName

Sets the hostname of the computer to a custom string or, if `hostName` is not specified, the private IPv4 address.

Frequency — always

AllowedStages — `[PostReady, UserData]`

Inputs —

`hostName`: (string) optional host name, which must be formatted as follows.

- Must be 15 characters or less
- Must contain only alphanumeric (a-z, A-Z, 0-9) and hyphen (-) characters.
- Must not consist entirely of numerical characters.

`reboot`: (boolean) denotes whether a reboot is permitted when the hostname is changed

Example

```
task: setHostName
inputs:
  reboot: true
```

setWallpaper

Creates the `setwallpaper.lnk` shortcut file in the startup folder of each existing user except for `Default User`. This shortcut file runs when the user logs in for the first time after instance boot. It sets up the instance with a custom wallpaper that displays the instance attributes.

The shortcut file path is:

```
$env:SystemDrive/Users/<user>/AppData/Roaming/Microsoft/Windows/Start Menu/Programs/
Startup/setwallpaper.lnk
```

> **Note**
>
> When you remove the `setWallpaper` task, it does not delete this shortcut file. For more information, see `setWallpaper` task is not enabled but the wallpaper resets at reboot.

Stages: You can configure wallpaper during the `PreReady` and `UserData` stages.

Frequency: `always`

Wallpaper configuration

You can use the following settings to configure your wallpaper.

Inputs

Input parameters that you provide, and attributes that you can set to configure your wallpaper:

path (string)

(Required) The filename path of the local .jpg format image file to use for your wallpaper image.

attributes (list of strings)

(Optional) You can add one or more of the following attributes to your wallpaper:

- `architecture`
- `availabilityZone`
- `hostName`
- `instanceId`
- `instanceSize`
- `privateIpAddress`
- `publicIpAddress`
- `ipv6Address`

instanceTags

(Optional) You can use exactly one of the following options for this setting.

- **AllTags** (string) – Add all instance tags to your wallpaper.

```
instanceTags: AllTags
```

- **instanceTags** (list of strings) – Specify a list of instance tag names to add to your wallpaper. For example:

```
instanceTags:
  - Tag 1
  - Tag 2
```

Example

The following example shows wallpaper configuration inputs that set the file path for the wallpaper background image, along with instance tags named `Tag 1` and `Tag 2`, and attributes that include the host name, instance ID, and private and public IP addresses for the instance.

```
task: setWallpaper
inputs:
  path: C:\ProgramData\Amazon\EC2Launch\wallpaper\Ec2Wallpaper.jpg
  attributes:
  - hostName
  - instanceId
  - privateIpAddress
  - publicIpAddress
  instanceTags:
  - Tag 1
  - Tag 2
```

> **Note**
>
> You must enable tags in metadata to show tags on the wallpaper. For more information about instance tags and metadata, see View tags for your EC2 instances using instance metadata.

startSsm

Starts the Systems Manager (SSM) service following Sysprep.

Frequency — always

AllowedStages — `[PostReady, UserData]`

Inputs — none

Example

```
task: startSsm
```

sysprep

Resets the service state, updates `unattend.xml`, disables RDP, and runs Sysprep. This task runs only after all other tasks are completed.

Frequency — once

AllowedStages — `[UserData]`

Inputs —

`clean`: (boolean) cleans instance logs before running Sysprep

`shutdown`: (boolean) shuts down the instance after running Sysprep

Example

```
task: sysprep
inputs:
clean: true
shutdown: true
```

writeFile

Writes a file to a destination.

Frequency — see *Inputs*

AllowedStages — `[PostReady, UserData]`

Inputs —

`frequency`: (string) one of `once` or `always`

`destination`: (string) path to which to write the content

`content`: (string) text to write to the destination

Example

```
task: writeFile
inputs:
  - frequency: once
  destination: C:\Users\Administrator\Desktop\booted.txt
  content: Windows Has Booted
```

Troubleshoot issues with the EC2Launch v2 agent

This section shows common troubleshooting scenarios for EC2Launch v2, information about viewing Windows event logs, and console log output and messages.

Troubleshooting topics

- Common troubleshooting scenarios
- Windows event logs
- EC2Launch v2 console log output

Common troubleshooting scenarios

This section shows common troubleshooting scenarios and steps for resolution.

Scenarios

- Service fails to set the wallpaper
- Service fails to run user data
- Service runs a task only one time
- Service fails to run a task
- Service runs user data more than once
- Scheduled tasks from EC2Launch v1 fail to run after migration to EC2Launch v2
- Service initializes an EBS volume that is not empty
- setWallpaper task is not enabled but the wallpaper resets at reboot
- Service stuck in running status
- Invalid agent-config.yml prevents opening EC2Launch v2 settings dialog box
- task:executeScript should be unique and only invoked once

Service fails to set the wallpaper

Resolution

1. Check that `%AppData%\Roaming\Microsoft\Windows\Start Menu\Programs\Startup\setwallpaper.lnk` exists.
2. Check `%ProgramData%\Amazon\EC2Launch\log\agent.log` to see if any errors occurred.

Service fails to run user data

Possible cause: Service may have failed before running user data.

Resolution

1. Check `%ProgramData%\Amazon\EC2Launch\state\previous-state.json`.
2. See if `boot`, `network`, `preReady`, and `postReadyLocalData` have all been marked as success.
3. If one of the stages failed, check `%ProgramData%\Amazon\EC2Launch\log\agent.log` for specific errors.

Service runs a task only one time

Resolution

1. Check the frequency of the task.
2. If the service already ran after Sysprep, and the task frequency is set to `once`, the task will not run again.
3. Set the frequency of the task to `always` if you want it to run the task every time EC2Launch v2 runs.

Service fails to run a task

Resolution

1. Check the latest entries in `%ProgramData%\Amazon\EC2Launch\log\agent.log`.
2. If no errors occurred, try running the service manually from `"%ProgramFiles%\Amazon\EC2Launch\EC2Launch.exe" run` to see if the tasks succeed.

Service runs user data more than once

Resolution

User data is handled differently between EC2Launch v1 and EC2Launch v2. EC2Launch v1 runs user data as a scheduled task on the instance when `persist` is set to `true`. If `persist` is set to `false`, the task is not scheduled even when it exits with a reboot or is interrupted while running.

EC2Launch v2 runs user data as an agent task and tracks its run state. If user data issues a computer restart or if user data was interrupted while running, the run state persists as `pending` and the user data will run again at the next instance boot. If you want to prevent the user data script from running more than once, make the script idempotent.

The following example idempotent script sets the computer name and joins a domain.

```
<powershell>
  $name = $env:computername
  if ($name -ne $desiredName) {
 Rename-Computer -NewName $desiredName
  }
  $domain = Get-ADDomain
  if ($domain -ne $desiredDomain)
  {
 Add-Computer -DomainName $desiredDomain
  }
  $telnet = Get-WindowsFeature -Name Telnet-Client
  if (-not $telnet.Installed)
  {
 Install-WindowsFeature -Name "Telnet-Client"
  }
</powershell>
<persist>false</persist>
```

Scheduled tasks from EC2Launch v1 fail to run after migration to EC2Launch v2

Resolution

The migration tool does not detect any scheduled tasks linked to EC2Launch v1 scripts; therefore, it does not automatically set up those tasks in EC2Launch v2. To configure these tasks, edit the `agent-config.yml` file, or use the EC2Launch v2 settings dialog box. For example, if an instance has a scheduled task that runs `InitializeDisks.ps1`, then after you run the migration tool, you

must specify the volumes you want to initialize in the EC2Launch v2 settings dialog box. See Step 6 of the procedure to Change settings using the EC2Launch v2 settings dialog box.

Service initializes an EBS volume that is not empty

Resolution

Before it initializes a volume, EC2Launch v2 attempts to detect whether it is empty. If a volume is not empty, it skips the initialization. Any volumes that are detected as not empty are not initialized. A volume is considered empty if the first 4 KiB of a volume are empty, or if a volume does not have a Windows-recognizable drive layout. A volume that was initialized and formatted on a Linux system does not have a Windows-recognizable drive layout, for example MBR or GPT. Therefore, it will be considered as empty and initialized. If you want to preserve this data, do not rely on EC2Launch v2 empty drive detection. Instead, specify volumes that you would like to initialize in the EC2Launch v2 settings dialog box (see step 6) or in the `agent-config.yml`.

`setWallpaper` task is not enabled but the wallpaper resets at reboot

The `setWallpaper` task creates the `setwallpaper.lnk` shortcut file in the startup folder of each existing user. This shortcut file runs when the user logs in for the first time after instance boot. It sets up the instance with a custom wallpaper that displays the instance attributes. Removing the `setWallpaper` task does not delete this shortcut file. You must manually delete this file or delete it using a script.

The shortcut path is:

`$env:SystemDrive/Users/<user>/AppData/Roaming/Microsoft/Windows/Start Menu/Programs/Startup/setwallpaper.lnk`

Resolution

Manually delete this file, or delete it using a script.

Example PowerShell script to delete shortcut file

```
foreach ($userDir in (Get-ChildItem "C:\Users" -Force -Directory).FullName)
{
 $startupPath = Join-Path $userDir -ChildPath "AppData\Roaming\Microsoft\Windows\Start
 Menu\Programs\Startup"
 if (Test-Path $startupPath)
 {
```

```
  $wallpaperSetupPath = Join-Path $startupPath -ChildPath "setwallpaper.lnk"
  if (Test-Path $wallpaperSetupPath)
  {
   Remove-Item $wallpaperSetupPath -Force -Confirm:$false
  }
 }
}
```

Service stuck in running status

Description

EC2Launch v2 is blocked, with log messages (`agent.log`) similar to the following:

```
2022-02-24 08:08:58 Info:
 ********************************************************************************
2022-02-24 08:08:58 Info: EC2Launch Service starting
2022-02-24 08:08:58 Info: Windows event custom log exists: Amazon EC2Launch
2022-02-24 08:08:58 Info: ACPI SPCR table not supported. Bailing Out
2022-02-24 08:08:58 Info: Serial port is in use. Waiting for Serial Port...
2022-02-24 08:09:00 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:02 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:04 Info: ACPI SPCR table not supported. Use default console port.
2022-02-24 08:09:06 Info: ACPI SPCR table not supported. Use default console port.
```

Possible cause

SAC is enabled and using the serial port. For more information, see Troubleshoot your Windows instance using SAC.

Resolution

Try the following steps to resolve this issue:

- Disable the service that is using the serial port.
- If you want the service to continue to use the serial port, write custom scripts to perform launch agent tasks and invoke them as scheduled tasks.

Invalid `agent-config.yml` prevents opening EC2Launch v2 settings dialog box

Description

EC2Launch v2 settings attempts to parse the `agent-config.yml` file before it opens the dialog box. If the YAML configuration file does not follow the supported schema, the dialog box will show the following error:

```
Unable to parse configuration file agent-config.yml. Review configuration file. Exiting application.
```

Resolution

1. Verify that the configuration file follows the supported schema.
2. If you want to start from scratch, copy the default configuration file into `agent-config.yml`. You can use the example `agent-config.yml` provided in the Task Configuration section.
3. You can also start over by deleting `agent-config.yml`. EC2Launch v2 settings generates an empty configuration file.

`task:executeScript should be unique and only invoked once`

Description

A task cannot be repeated in the same stage.

Resolution

Some tasks must be input as an array, such as **executeScript** and **executeProgram**. For an example of how to write the script as an array, see **executeScript**.

Windows event logs

EC2Launch v2 publishes Windows event logs for important events, such as service starting, Windows is ready, and task success and failure. Event identifiers uniquely identify a particular event. Each event contains stage, task, and level information, and a description. You can set triggers for specific events using the event identifier.

Event IDs provide information about an event and uniquely identify some events. The least significant digit of an event ID indicates the severity of an event.

Event	Least significant digit
Success	. . .0

Event	Least significant digit
Informational	. . .1
Warning	. . .2
Error	. . .3

Service-related events that are generated when the service starts or stops include a single digit event identifier.

Event	Single digit identifier
Success	0
Informational	1
Warning	2
Error	3

The event messages for `EC2LaunchService.exe` events begin with `Service:`. The event messages for `EC2Launch.exe` events do not begin with `Service:`.

Four digit event IDs include information about the stage, task, and severity of an event.

Topics

- Event ID format
- Event ID examples
- Windows event log schema

Event ID format

The following table shows the format of an EC2Launch v2 event identifier.

3	2 1	0

3	2 1	0
S	T	L

The letters and numbers in the table represent the following event type and definitions.

Event type	Definition
S (Stage)	0 - Service-level message 1 - Boot 2 - Network 3 - PreReady 5 - Windows is Ready 6 - PostReady 7 - User Data
T (Task)	The tasks represented by the corresponding two values are different for each stage. To view the complete list of events, see Windows Event log schema.
L (Level of the event)	0 - Success 1 - Informational 2 - Warning 3 - Error

Event ID examples

The following are example event IDs.

- 5000 - Windows is ready to use
- 3010 - Activate windows task in PreReady stage was successful
- 6013 - Set wallpaper task in PostReady Local Data stage encountered an error

Windows event log schema

MessageId/Event Id	Event message
. . .0	Success
. . .1	Informational
. . .2	Warning
. . .3	Error
x	EC2Launch service-level logs
0	EC2Launch service exited successfully
1	EC2Launch service informational logs
2	EC2Launch service warning logs
3	EC2Launch service error logs
10	Replace state.json with previous-state.json
100	Serial Port
200	Sysprep
300	PrimaryNic
400	Metadata

MessageId/Event Id	Event message
x000	Stage (1 digit), Task (2 digits), Status (1 digit)
1000	Boot
1010	Boot - extend_root_partition
2000	Network
2010	Network - add_routes
3000	PreReady
3010	PreReady - activate_windows
3020	PreReady - install_egpu_manager
3030	PreReady - set_monitor_on
3040	PreReady - set_hibernation
3050	PreReady - set_admin_account
3060	PreReady - set_dns_suffix
3070	PreReady - set_wallpaper
3080	PreReady - set_update_schedule
3090	PreReady - output_log
3100	PreReady - enable_open_ssh
5000	Windows is Ready to use
6000	PostReadyLocalData
7000	PostReadyUserData

MessageId/Event Id	Event message
6010/7010	PostReadyLocal/UserData - set_wallpaper
6020/7020	PostReadyLocal/UserData - set_update_schedule
6030/7030	PostReadyLocal/UserData - set_hostname
6040/7040	PostReadyLocal/UserData - execute_program
6050/7050	PostReadyLocal/UserData - execute_script
6060/7060	PostReadyLocal/UserData - manage_package
6070/7070	PostReadyLocal/UserData - initialize_volume
6080/7080	PostReadyLocal/UserData - write_file
6090/7090	PostReadyLocal/UserData - start_ssm
7100	PostReadyUserData - enable_open_ssh
6110/7110	PostReadyLocal/UserData - enable_jumbo_frames

EC2Launch v2 console log output

This section contains sample console log output for EC2Launch v2 and lists all of the EC2Launch v2 console log error messages to help you to troubleshoot issues. For more information about instance console output and how to access it, see the section called “Instance console output”.

Outputs

- EC2Launch v2 console log output
- EC2Launch v2 console log messages

EC2Launch v2 console log output

The following is sample console log output for EC2Launch v2. Some values in this example are substituted with representative text surrounded by curly braces.

```
2025/07/22 21:26:53Z: Windows sysprep configuration complete.
2025/07/22 21:26:53Z: Message: Waiting for access to metadata...

EC2Launch v2 console log messages

The following is a list of all of the EC2Launch v2 console log messages.

```
Error EC2Launch service is stopping. {error message}
```

Stopped service error details:

- `Error setting up EC2Launch agent folders`
- `See instance logs for detail`
- `Error stopping service`
- `Error initializing service`

```
Windows sysprep configuration complete
```

```
Invalid administrator username: {invalid username}
```

```
Invalid administrator password
Username: {username}
Password: <Password>{encrypted password}</Password>
```

The following message is an information block that contains AMI details:

```
AMI Origin Version: {amiVersion}
AMI Origin Name: {amiName}
```

```
Microsoft Windows NT {currentVersion}.{currentBuildNumber}
OsVersion: {currentVersion}
OsProductName: {productName}
OsBuildLabEx: {buildLabEx}
OsCurrentBuild: {currentBuild}
OsReleaseId: {releaseId}
Language: {language}
TimeZone: {timeZone}
Offset: UTC {offset}
Launch agent: EC2Launch {BuildVersion}
AMI-ID: {amiId}
Instance-ID: {instanceId}
Instance Type: {instanceType}

EC2Launch v2 version histories

Version histories

- EC2Launch v2 version history

EC2Launch v2 version history

To ensure that you have the latest launch agent installed, see Install the latest version of EC2Launch v2. You can receive notifications when new versions of the EC2Launch v2 agent are released. For more information, see Subscribe to EC2 Windows launch agent notifications.

The following table describes the released versions of EC2Launch v2.

Version	Details	Release date
2.5.2	• Fixed an issue where RDP certificate validation fails for custom certificates and Group Policy-deployed certificates.	August 5, 2026
2.5.1	• Improved error detection when enabling hibernation.	June 3, 2026
2.5.0	• Updated serial port logic to continue agent tasks when the serial port is unavailable. • Added EC2 Windows Utility Device driver version to instance console output. • Removed unused bench.log file. • Optimized driver lookup when writing to instance console output.	May 4, 2026
2.4.0	• Simplified agent logging by removing redundant `console.log` , `err.log` files. •	March 5, 2026

Version	Details	Release date
	Enhanced agent logging capabilities by adding log rotation, limiting log size to 1 MB and improving time precision to milliseconds. • Removed Hyper-V status query and related instance console output.	
2.3.237	• Fixed an agent crash issue caused by the incompatibility between certain Visual C++ runtime versions and agent telemetry functions.	February 25, 2026
2.3.108	• Added IPv6 address display to wallpaper. For Memory and Network attributes, consult AWS Documentation.	December 29, 2025
2.3.56	• Fixed an issue where preconfigured persistent network routes were not handled properly by EC2Launch v2.	November 4, 2025
2.3.5	• Improved primary network interface detection using IMDS when adding routes.	September 15, 2025
2.2.63	• Updated launch agent to improve Telemetry.	July 29, 2025
2.1.1	• Added full support for IPv6.	May 14, 2025
2.0.2107	• Enhanced route addition to handle scenarios when IPv4 or IPv6 addresses are not available on the interface.	March 27, 2025

Version	Details	Release date
2.0.2081	• Fixed an issue where RDP certificate information was not properly retrieved or validated. Added functionality to automatically start the Remote Desktop Services if needed. • Adjusted EC2Launch v2 service permissions to fix an issue that occurs when querying the service status.	February 4, 2025
2.0.2046	• Updated the wallpaper path in the `agent-config.yml` file to use the default operating system wallpaper path. • Added telemetry to monitor the locations where agent errors occurred. • Updated agent log messaging.	October 3, 2024
2.0.1981	• Updated `EC2Launch.exe` CLI command error messages for non-Administrator users.	August 6, 2024
2.0.1948	• Added telemetry to monitor usage of admin password options. • Modified EC2Launch permissions.	July 1, 2024
2.0.1924	• Updated the EC2Launch Settings UI. • Updated the wallpaper CLI command. • Updated the EC2Launch installer.	June 10, 2024

Version	Details	Release date
2.0.1914	• Add routes with unspecified gateway addresses (`0.0.0.0` for IPv4 or `::` for IPv6). • Always add both IPv4 and IPv6 routes. • Fixed an issue where the `Administrator` username was added to the `agent-config.yml` file when it wasn't specified. • Modified EC2Launch v2 permissions.	June 5, 2024
2.0.1881	• Added an encrypted password option to `setAdminAccount` task. • Added CLI command to encrypt static password in agent-config.yml. • Fixed an issue where XML user data doesn't add PowerShell arguments when it runs with Administrator permissions. For more details, see How Amazon EC2 handles user data for Windows instances. • Adjusted PowerShell arguments for the `executeScript` task and user data scripts when they run with `LocalSystem` permissions. When arguments are empty, the agent uses the following default value: `-ExecutionPolicy Unrestricted`. • Prevented printing duplicate driver versions to the console log.	May 8, 2024

Version	Details	Release date
2.0.1815	• Adjusted error handling to fail on critical setup issues before sysprep. • Fixed an issue where wallpaper and hostname tasks could use an incorrect IP address on instances with multiple IP addresses assigned to the primary network interface. • Wallpaper and hostname tasks changed to get private IP from IMDS first, then fail back to WMI if IMDS is disabled. • Fixed an issue with the `initializeVolume` task where `sc1` volumes failed to initialize due to a transient error.	March 6, 2024
2.0.1739	• Fixed an issue that prevented exit codes from being captured by `executeScript` tasks that were run as the Windows Administrator user.	January 17, 2024
2.0.1702	• Restricted `Telemetry.log` permissions to `read-execute` only for standard users. • Configured the EC2Launch Windows service to restart on start-up failure. • Made `add-routes` failures actionable by logging `route.exe stderr` output. • Fixed an issue that occurs when route metrics are outside of the range [1, 9999]. • Added wallpaper support to several new instance types. • Fixed an issue caused by user data scripts that run as the Windows Administrator user and send output to `stderr`.	January 4, 2024

Version	Details	Release date
2.0.1643	• Updated the `ebsnvme-id.exe` tool to version 1.1.0.7. • Fixed an issue with receive side scaling (RSS) and receive queue depth settings on metal instance types that begin with 'metal-*', such as metal-48x1. • Removed telemetry event that reports on XML userdata commands that block the agent. • Updated `setDnsSuffix` task to limit domain name devolution based on registry entry: `HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel`. • Added a public task and CLI that adds network routes. • *Note* – This is the last version to officially support Windows Server 2012. • *Note* – This is the last version to officially support 32-bit operating systems.	October 4, 2023
2.0.1580	• Changed the way that the launch agent handles errors when you modify log file permissions. • Added a timeout for connecting to the serial port. The time out allows the launch agent to continue running if the serial port is in use.	September 5, 2023

Version	Details	Release date
2.0.1521	• Deprecated the –block flag of the EC2Launch.exe **reset** and **sysprep** commands. • Updated EC2Launch.exe to detect and handle the **reset** and **sysprep** commands that are used in inline executeScript tasks. Those commands cause the agent to stop running after the executeScript task runs them. • Updated XML userdata scripts to run inline by default. • Enable XML userdata scripts to run detached with the new detach tag. For more details, see User data scripts. • Made the following changes to the agent log. • Updated agent log messages. • Removed executeScript content and output from the agent log. • Removed executeProgram arguments and output from the agent log. • Made the following changes to the console log. • Added EnableSCSIPersistentReservations value to the console log.	July 3, 2023

Version	Details	Release date
2.0.1303	• Added additional error handling and log lines when adding network routes. • Allowed `executeScript` and `executeProgram` tasks in the PreReady stage. • Updated `executeProgram` task to generate output files similar to the output from the executeScript task. For more information, see executeProgram. • Added telemetry to monitor usage of blocking agent commands in XML user data.	May 3, 2023
2.0.1245	• Improved visibility into crashes by logging crash call stacks in clear text. • Added the EventLog service as a startup dependency to fix a crash when the Amazon EC2Launch service starts up faster than the EventLog service. • Made XML user data run before PostReady stage from the agent config file (like EC2Launch v1 and EC2Config). • Added YAML user data version 1.1 to make user data run before PostReady stage from the agent config file (YAML user data version 1.0 runs after PostReady stage from the agent config file).	March 8, 2023

Version	Details	Release date
2.0.1173	• Adds an optional feature to display instance tags on wallp aper. For more information, see setWallpaper. • Adds error handling when the security group for Elastic Graphics is not properly set up. • Fixes a timeout when the Instance Metadata Service is not enabled.	February 6, 2023
2.0.1121	• Fixes an issue where a 404 error is printed to the wallpaper when no public IPv4 address is assigned. • Fixes an issue where the volume's file system is formatted as `RAW` instead of `NTFS` when its device's drive letter is set to `D`. • Fixes an issue where NVMe SSD volumes are incorrectly identified as EBS volumes. • Fixes an error when activating Windows when IMDS is disab led.	January 4, 2023

Version	Details	Release date
2.0.1082	• Fixes an issue where the `setWallpaper : privateIp Address` field is blank when IMDS is disabled. • Fixes an issue with setting the hostname to the private IPv4 address when IMDS is disabled. • Fixes an issue with initializing volumes on Windows Server 2012. • Fixes an issue with setting jumbo frames. • Fixes an error when no SSH key is specified at instance launch. • Fixes an error on Windows Server 2012 when Windows does not have a 'ReleaseId' registry key.	December 7, 2022
2.0.1011	• Fixes logic for finding network adapter when PnPDeviceID is empty.	November 11, 2022
2.0.1009	• Uses PCI segment information to select the console port.	November 8, 2022
2.0.982	• Adds retry logic to get RDP information. • Fixes errors during volume initialization on `d2.8xlarge` instances. • Fixes issue where an incorrect network adapter can be selected after a reboot. • Removes false alarm error message when ACPI SPCR is unavailable.	October 31, 2022

Version	Details	Release date
2.0.863	• Updates IMDS wait logic to make only IMDSv2 requests. • Adds logic to assign drive letter to volumes that are already initialized but not mounted. • Prints a more specific error message when key pair type is not supported. • Fixes 3010 reboot code bug. • Adds check for invalid base64-encoded user data.	July 6, 2022
2.0.698	• Fixes typo in log output when executing scripts.	January 30, 2022
2.0.674	• Telemetry uploads the enabled/disabled privacy control. • Fixes `index out of bounds` bug. • Removes wallpaper shortcuts during `sysprep`.	November 15, 2021
2.0.651	• Adds logic to uninstall legacy agents during EC2Launch v2 installation. • Fixes `list-volume` CLI issue when root volume is not listed as volume 0.	October 7, 2021
2.0.592	• Fixes bug to correctly report stage status. • Removes false alarm error messages when log files are clos ed. • Adds telemetry.	August 31, 2021

Version	Details	Release date
2.0.548	• Adds leading zeros for hex IP hostname. • Fixes file permissions for `enableOpenSsh` task. • Fixes sysprep command crash.	August 4, 2021
2.0.470	• Fixes bug in network stage to wait for DHCP to assign an IP to the instance. • Fixes bug with `setDnsSuffix` when `SearchList` registry key does not exist. • Fixes bug in DNS devolution logic in `setDnsSuffix` . • Adds network routes after intermediate reboots. • Allows `initializeVolume` to re-letter existing volumes. • Removes extra information from version subcommand.	July 20, 2021
2.0.285	• Adds option to run user scripts in a detached process. • Legacy userdata (XML userdata) now runs in a detached process, which is similar behavior to the prior launch agent. • Adds CLI flag to the `sysprep` and `reset` commands, which allows them to block until the service stops. • Restricts the config folder permissions.	March 8, 2021

Version	Details	Release date
2.0.207	• Adds optional `hostName` field to `setHostName` task. • Fixes reboot bug. Reboot tasks `executeScript` and `executeProgram` will be marked as running. • Adds more return codes to the status command. • Adds bootstrap service to fix startup issue when running on `t2.nano` instance type. • Fixes clean installation mode to remove files not tracked by installer.	February 2, 2021
2.0.160	• Fixes `validate` command to detect invalid stage name. • Adds `w32tm resync` command in `addroutes` task. • Fixes issue with changing DNS suffix search order. • Adds check conditions to better report invalid user data.	December 4, 2020
2.0.153	Adds Sysprep functionality in UserData.	November 3, 2020

Version	Details	Release date
2.0.146	• Fixes issue with RootExtend on non-English AMIs. • Grants users group write permission to log files. • Creates MS Reserved partition for GPT volumes. • Adds list-volumes command and volume dropdown in Amazon EC2Launch settings. • Adds get-agent-config command for printing agent-config.yml file in yaml or json format. • Erases static password if no public key detected.	October 6, 2020
2.0.124	• Adds option to display OS version on wallpaper. • Initializes encrypted EBS volumes. • Adds routes for VPCs with no local DNS name.	September 10, 2020
2.0.104	• Creates DNS suffix search list if it does not exist. • Skips Hibernation if not requested.	August 12, 2020
2.0.0	Initial release.	June 30, 2020

Use the EC2Launch v1 agent to perform tasks during EC2 Windows instance launch

Amazon managed AMIs for Windows Server 2016 and 2019 include a set of Windows Powershell scripts called EC2Launch. EC2Launch performs tasks during the initial instance boot. For information about the EC2Launch versions that are included in AWS Windows AMIs, see the AWS Windows AMI Reference.

Note

The latest launch agent for Windows Server 2016 and later operating system versions is EC2Launch v2, which replaces both EC2Config and EC2Launch, and comes pre-installed on AWS Windows Server 2016 and 2019 AMIs with names that begin with `EC2LaunchV2-Windows_Server-*`. You can also manually install and configure the agent on Windows Server 2016 and 2019. For more information, see Install EC2Launch v2.
To use EC2Launch with IMDSv2, the version must be 1.3.2002730 or later.

You can use the following Windows PowerShell command to verify the installed version of EC2Launch.

```
Test-ModuleManifest -Path "C:\ProgramData\Amazon\EC2-Windows\Launch\Module
\Ec2Launch.psd1" | Select Version
```

EC2Launch tasks

EC2Launch performs the following tasks by default during the initial instance boot:

- Sets up new wallpaper that renders information about the instance.
- Sets the computer name to the private IPv4 address of the instance.
- Sends instance information to the Amazon EC2 console.
- Sends the RDP certificate thumbprint to the EC2 console.
- Sets a random password for the administrator account.
- Adds DNS suffixes.
- Dynamically extends the operating system partition to include any unpartitioned space.
- Executes user data (if specified). For more information about specifying user data, see Run commands when you launch an EC2 instance with user data input.
- Sets persistent static routes to reach the metadata service and AWS KMS servers.

Important

If a custom AMI is created from this instance, these routes are captured as part of the OS configuration and any new instances launched from the AMI will retain the same routes,

regardless of subnet placement. To update the routes, see Update metadata/KMS routes for Server 2016 and later when launching a custom AMI.

The following tasks help to maintain backward compatibility with the EC2Config service. You can also configure EC2Launch to perform these tasks during startup:

- Initialize secondary EBS volumes.
- Send Windows Event logs to the EC2 console logs.
- Send the *Windows is ready to use* message to the EC2 console.

EC2Launch directory structure

EC2Launch is installed by default on Windows Server 2016 and later AMIs in the root directory `C:\ProgramData\Amazon\EC2-Windows\Launch`.

Note

By default, Windows hides files and folders under `C:\ProgramData`. To view EC2Launch directories and files, you must either type the path in Windows Explorer or change the folder properties to show hidden files and folders.

The `Launch` directory contains the following subdirectories.

- `Scripts` — Contains the PowerShell scripts that make up EC2Launch.
- `Module` — Contains the module for building scripts related to Amazon EC2.
- `Config` — Contains script configuration files that you can customize.
- `Sysprep` — Contains Sysprep resources.
- `Settings` — Contains an application for the Sysprep graphical user interface.
- `Library` — Contains shared libraries for EC2 launch agents.
- `Log` — Contains subdirectories for scripts and the log files that are generated by the scripts.

Telemetry

Telemetry is additional information that helps AWS to better understand your requirements, diagnose issues, and deliver features to improve your experience with AWS services.

EC2Launch version `1.3.2003498` and later collect telemetry, such as usage metrics and errors. This data is collected from the Amazon EC2 instance on which EC2Launch runs. This includes all Windows AMIs owned by AWS.

The following types of telemetry are collected by EC2Launch:

- **Usage information** — agent commands, install method, and scheduled run frequency.
- **Errors and diagnostic information** — agent installation and run error codes.

Examples of collected data:

```
2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsAgentScheduledPerBoot=true
2021/07/15 21:44:12Z: EC2LaunchTelemetry: IsUserDataScheduledPerBoot=true
2021/07/15 21:44:12Z: EC2LaunchTelemetry: AgentCommandCode=1
2021/07/15 21:44:12Z: EC2LaunchTelemetry: AgentCommandErrorCode=5
2021/07/15 21:44:12Z: EC2LaunchTelemetry: AgentInstallCode=2
2021/07/15 21:44:12Z: EC2LaunchTelemetry: AgentInstallErrorCode=0
```

Telemetry is enabled by default. You can disable telemetry collection at any time. If telemetry is enabled, EC2Launch sends telemetry data without additional customer notifications.

Your choice to enable or disable telemetry is collected.

You can opt in or out of telemetry collection. Your selection to opt in or out of telemetry is collected to ensure that we adhere to your telemetry option.

Telemetry visibility

When telemetry is enabled, it appears in the Amazon EC2 console output as follows:

```
2021/07/15 21:44:12Z: Telemetry: <Data>
```

Disable telemetry on an instance

To disable telemetry by setting a system environment variable, run the following command as an administrator:

```
setx /M EC2LAUNCH_TELEMETRY 0
```

To disable telemetry during installation, run `install.ps1` as follows:

```
. .\install.ps1 -EnableTelemetry:$false
```

More topics for EC2Launch

- Install the latest version of EC2Launch
- Configure the EC2Launch v1 agent on your Windows instance
- EC2Launch version history

Install the latest version of EC2Launch

Use the following procedure to download and install the latest version of EC2Launch on your instances.

To download and install the latest version of EC2Launch

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.
2.
3.
4. Run `install.ps1`
5. If you made a backup of the EC2Launch configuration file, copy it to the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.

To download and install the latest version of EC2Launch using PowerShell

If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.

To install the latest version of EC2Launch using PowerShell, run the following commands from a PowerShell window as an administrator:

```
mkdir $env:USERPROFILE\Desktop\EC2Launch
$Url = "https://s3.amazonaws.com/ec2-downloads-windows/EC2Launch/latest/EC2-Windows-
Launch.zip"
$DownloadZipFile = "$env:USERPROFILE\Desktop\EC2Launch\" + $(Split-Path -Path $Url -
Leaf)
Invoke-WebRequest -Uri $Url -OutFile $DownloadZipFile
$Url = "https://s3.amazonaws.com/ec2-downloads-windows/EC2Launch/latest/install.ps1"
$DownloadZipFile = "$env:USERPROFILE\Desktop\EC2Launch\" + $(Split-Path -Path $Url -
Leaf)
Invoke-WebRequest -Uri $Url -OutFile $DownloadZipFile
& $env:USERPROFILE\Desktop\EC2Launch\install.ps1
```

Note

If you receive an error when downloading the file, and you are using Windows Server 2016, TLS 1.2 might need to be enabled for your PowerShell terminal. You can enable TLS 1.2 for the current PowerShell session with the following command and then try again:

```
[Net.ServicePointManager]::SecurityProtocol = [Net.SecurityProtocolType]::Tls12
```

Verify the installation by checking the launch agent. Run the following commands from a PowerShell window as an administrator:

```
Import-Module C:\ProgramData\Amazon\EC2-Windows\Launch\Module\Ec2Launch.psm1
Import-LocalizedData -BaseDirectory C:\ProgramData\Amazon\EC2-Windows\Launch\Module\ -
FileName 'Ec2Launch.psd1' -BindingVariable moduleManifest
$moduleManifest.Get_Item('ModuleVersion')
```

Configure the EC2Launch v1 agent on your Windows instance

After your instance has been initialized the first time, you can configure EC2Launch to run again and perform different start-up tasks.

Tasks

- Configure initialization tasks

- Schedule EC2Launch to run on every boot
- Initialize drives and map drive letters
- Send Windows event logs to the EC2 console
- Send Windows is ready message after a successful boot

Configure initialization tasks

Specify settings in the `LaunchConfig.json` file to enable or disable the following initialization tasks:

- Set the computer name to the instance private IPv4 address.
- Set the monitor to always stay on.
- Set up new wallpaper.
- Add DNS suffix list.

> **Note**
>
> This adds a DNS suffix lookup for the following domain and configures other standard suffixes. For more information about how launch agents set DNS suffixes, see Configure DNS Suffix for EC2 Windows launch agents.
>
> ```
> region.ec2-utilities.amazonaws.com
> ```

- Extend the boot volume size.
- Set the administrator password.

To configure initialization settings

1. On the instance to configure, open the following file in a text editor: `C:\ProgramData\Amazon\EC2-Windows\Launch\Config\LaunchConfig.json`.
2. Update the following settings as needed and save your changes. Provide a password in `adminPassword` only if `adminPasswordtype` is `Specify`.

```
{
 "setComputerName": false,
```

```
 "setMonitorAlwaysOn": true,
 "setWallpaper": true,
 "addDnsSuffixList": true,
 "extendBootVolumeSize": true,
 "handleUserData": true,
 "adminPasswordType": "Random | Specify | DoNothing",
 "adminPassword": "password that adheres to your security policy (optional)"
}
```

The password types are defined as follows:

`Random`

EC2Launch generates a password and encrypts it using the user's key. The system disables this setting after the instance is launched so that this password persists if the instance is rebooted or stopped and started.

`Specify`

EC2Launch uses the password you specify in `adminPassword`. If the password does not meet the system requirements, EC2Launch generates a random password instead. The password is stored in `LaunchConfig.json` as clear text and is deleted after Sysprep sets the administrator password. EC2Launch encrypts the password using the user's key.

`DoNothing`

EC2Launch uses the password you specify in the `unattend.xml` file. If you don't specify a password in `unattend.xml`, the administrator account is disabled.

3. In Windows PowerShell, run the following command to schedule the script to run as a Windows Scheduled Task. The script runs one time during the next boot and then disables these tasks from running again.

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -Schedule
```

Schedule EC2Launch to run on every boot

You can schedule EC2Launch to run on every boot instead of only the initial boot.

To enable EC2Launch to run on every boot:

1. Open Windows PowerShell and run the following command:

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -
SchedulePerBoot
```

2. Or, run the executable with the following command:

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Settings\Ec2LaunchSettings.exe
```

Then select `Run EC2Launch on every boot`. You can specify that your EC2 instance `Shutdown without Sysprep` or `Shutdown with Sysprep`.

Note

When you enable EC2Launch to run on every boot, the following happens the next time EC2Launch runs:

- If `AdminPasswordType` is still set to `Random`, EC2Launch will generate a new password at the next boot. After that boot, `AdminPasswordType` is automatically set to `DoNothing` to prevent EC2Launch from generating new passwords on subsequent boots. To prevent EC2Launch from generating a new password on the first boot, manually set `AdminPasswordType` to `DoNothing` before you reboot.
- `HandleUserData` will be set back to `false` unless the user data has `persist` set to `true`. For more information, see the section called “User data scripts”.

Initialize drives and map drive letters

Specify settings in the `DriveLetterMappingConfig.json` file to map drive letters to volumes on your EC2 instance. The script initializes drives that are not already initialized and partitioned. For more information about getting volume details in Windows, see Get-Volume in the Microsoft documentation.

To map drive letters to volumes

1. Open the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config\DriveLetterMappingConfig.json` file in a text editor.
2. Specify the following volume settings and save your changes:

```
{
 "driveLetterMapping": [
  {
   "volumeName": "sample volume",
   "driveLetter": "H"
  }
 ]
}
```

3. Open Windows PowerShell and use the following command to run the EC2Launch script that initializes the disks:

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1
```

To initialize the disks each time the instance boots, add the `-Schedule` flag as follows:

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeDisks.ps1 -Schedule
```

Send Windows event logs to the EC2 console

Specify settings in the `EventLogConfig.json` file to send Windows Event logs to EC2 console logs.

To configure settings to send Windows Event logs

1. On the instance, open the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config\EventLogConfig.json` file in a text editor.
2. Configure the following log settings and save your changes:

```
{
 "events": [
  {
   "logName": "System",
   "source": "An event source (optional)",
   "level": "Error | Warning | Information",
   "numEntries": 3
  }
 ]
}
```

3. In Windows PowerShell, run the following command so that the system schedules the script to run as a Windows Scheduled Task each time the instance boots.

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\SendEventLogs.ps1 -Schedule
```

   The logs can take three minutes or more to appear in the EC2 console logs.

Send Windows is ready message after a successful boot

The EC2Config service sent the "Windows is ready" message to the EC2 console after every boot. EC2Launch sends this message only after the initial boot. For backwards compatibility with the EC2Config service, you can schedule EC2Launch to send this message after every boot. On the instance, open Windows PowerShell and run the following command. The system schedules the script to run as a Windows Scheduled Task.

```
C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\SendWindowsIsReady.ps1 -Schedule
```

EC2Launch version history

To download and install the latest version of EC2Launch, see Install the latest version of EC2Launch.

The following table describes the released versions of EC2Launch.

Version	Details	Release date
1.4.299	• Optimized logic for retrieving EC2WinUtil driver version. • Reduced time to Windows is Ready by removing Hyper-V status query.	3 March 2026
1.4.183	• Updated installer logic to prevent unsupported installation on Windows Server 2022. • Updated to print EC2WinUtil driver version to instance console log.	4 February 2026

Version	Details	Release date
1.4.6	• Updated agent log messaging.	13 October 2025
1.3.2005119	• Fixed an issue where `Invoke-Userdata` would fail when called without any parameters.	11 February 2025
1.3.2005065	• Fixed an issue where RDP certificate information was not properly retrieved or validated. Added functionality to automatically start the Remote Desktop Services if needed.	22 October 2024
1.3.2005008	• Updated `Set-Wallpaper` to fall back to a solid color background if the default wallpaper image is not found.	6 August 2024
1.3.2004959	• Updated installer logic to prevent unsupported installation on Windows Server 2025 or later.	2 July 2024
1.3.2004891	• Fixed an issue where `HandleUserData` was not set to `false` as expected. • Added an `Encrypted` password option to `LaunchConfig.json`. • Changed `Settings UI` behavior to encrypt the user specified password by default. • Added `SetAdminPasswordConfig.ps1` to convert the `Specify` password option to the `Encrypted` password option in the agent configuration file.	31 May 2024
1.3.2004617	• Fixed an error when setting the wallpaper.	15 January 2024

Version	Details	Release date
1.3.2004592	• Updated access permissions set by install.ps1 for `%ProgramData%\Amazon\EC2-Windows\Launch` . • Restricted EC2Launch folder/file access to read-execute only for standard user accounts. • Changed the agent to stop waiting for the Instance Metadata Service (IMDS) to initialize if IMDS is not enabled for the instance. • Added a five minute timeout when waiting for the IMDS to initialize. • Changed the agent to write telemetry to the instance console log before the `Windows is Ready` message instead of after. • Added wallpaper support to several new instance types. For more information about access permissions and user account permissions of EC2Launch directories, see the section called “EC2Launch directory structure”.	2 January 2024
1.3.2004491	• Added telemetry to monitor usage of the **Specify admin password** option.	9 November 2023
1.3.2004462	• Added flush after every write to the serial console.	18 October 2023

Version	Details	Release date
1.3.2004438	• Limit domain name devolution based on registry entry: `HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel`. • Limited `UserdataExecution.log` permissions to `Administrators` only. • Added error messages in the Windows Event Log when log initialization fails.	4 October 2023
1.3.2004256	• Added `EnableSCSIPersistentReservations` value to console log. • Added retry capability for **Get-ConsolePort**.	7 July 2023
1.3.2004052	• Fixed an error that occurred when no SSH key is specified at instance launch. • Updated to retry starting the AmazonSSMAgent Windows service on failure. • Updated to fail SysprepInstance.ps1 if BeforeSysprep.cmd fails with a non-zero exit code.	8 March 2023
1.3.2003975	• Fixed issue impacting Packer AMI builds where `SysprepInstance.ps1` returns a `$LastErrorCode` of 1.	24 December 2022

Version	Details	Release date
1.3.2003961	• Fixed issue where explicitly specified administrator passwords are overwritten with a random password on fast-launched instances. • Fixed issue where SSM Agent fails to start on smaller instance types. • Fixed an issue where the instance console log contains `RDPCERTIFICATE-THUMBPRINT: 0000000 0000000000000000` instead of a valid RDP certificate thumbprint value.	6 December 2022
1.3.2003923	• Fixes logic for finding network adapter when PnPDeviceID is empty.	9 November 2022
1.3.2003919	• Updated Get-ConsolePort to use PCI segment information. • Fixed issue where an incorrect network adapter can be selected after reboot. • Fixed start-SSM-Agent timeout logic. • Fixed backwards compatibility for Send-AdminCredentials function alias.	8 November 2022
1.3.2003857	• Prioritizes adapters with a default gateway when the primary network adapter is selected. • Extended in-memory password encryption.	3 October 2022

Version	Details	Release date
1.3.2003824	• Fixed error during `setComputerName` . • Added logic to skip Windows activation when a BYOL billing code is detected. • Added in-memory password encryption. • Fixed error during volume initialization on `m6id.4xlarge` .	30 August 2022
1.3.2003691	• Updated IMDS wait logic to make only IMDSv2 requests. • Fixed bug impacting eGPU installation.	21 June 2022
1.3.2003639	• Added network-adapter wait logic to prevent use before initialization. • Fixed minor issues.	10 May 2022
1.3.2003498	• Added telemetry. • Added shortcut to Settings UI. • Formatted PowerShell scripts. • Fixed issue with shutdown occurring before BeforeSysprep.cmd completes.	31 January 2022
1.3.2003411	Changed password generation logic to exclude passwords with low complexity.	04 August 2021
1.3.2003364	Updated Install-EgpuManager with IMDSv2 support.	07 June 2021

Version	Details	Release date
1.3.2003312	• Added log lines before and after `setMonitorAlwaysOn` setting. • Added AWS Nitro Enclaves package version to console log.	04 May 2021
1.3.2003284	Improved permission model by updating location for storing user data to `LocalAppData`.	23 March 2021
1.3.2003236	• Updated method for setting user password in `Set-AdminAccount` and `Randomize-LocalAdminPassword`. • Fixed `InitializeDisks` to check whether disk is set to read only before setting it to writable.	11 February 2021
1.3.2003210	Localization fix for `install.ps1`.	7 January 2021
1.3.2003205	Security fix for `install.ps1` to update permissions on `%ProgramData%AmazonEC2-WindowsLaunch ModuleScripts` directory.	28 December 2020
1.3.2003189	Added `w32tm resync` after adding routes.	4 December 2020
1.3.2003155	Updated instance type information.	25 August 2020
1.3.2003150	Added `OsCurrentBuild` and `OsReleaseId` to console output.	22 April 2020
1.3.2003040	Fixed IMDS version 1 fallback logic.	7 April 2020
1.3.2002730	Added support for IMDS V2.	3 March 2020

Version	Details	Release date
1.3.2002240	Fixed minor issues.	31 October 2019
1.3.2001660	Fixed automatic login issue for users without password after first time executing Sysprep.	2 July 2019
1.3.2001360	Fixed minor issues.	27 March 2019
1.3.2001220	All PowerShell scripts signed.	28 February 2019
1.3.2001200	Fixed issue with InitializeDisks.ps1 where running the script on a node in a Windows Server Failover Cluster would format drives on remote nodes whose drive letter matched the local drive letter.	27 February 2019
1.3.2001160	Fixed missing wallpaper in Windows 2019.	22 February 2019
1.3.2001040	• Added plugin for setting the monitor to never turn off to fix ACPI issues. • SQL Server edition and version written to console.	21 January 2019
1.3.2000930	Fix for adding routes to metadata on ipv6-enabled ENIs.	2 January 2019
1.3.2000760	• Added default configuration for RSS and Receive Queue se ttings for ENA devices. • Disabled hibernation during Sysprep.	5 December 2018

Version	Details	Release date
1.3.2000630	• Added route 169.254.169.253/32 for DNS server. • Added filter of setting Admin user. • Improvements made to instance hibernation. • Added option to schedule EC2Launch to run on every boot.	9 November 2018
1.3.2000430.0	• Added route 169.254.169.123/32 to AMZN time service. • Added route 169.254.169.249/32 to GRID license service. • Added timeout of 25 seconds when attempting to start Systems Manager.	19 September 2018
1.3.200039.0	• Fixed improper drive lettering for EBS NVME volumes. • Added additional logging for NVME driver versions.	15 August 2018
1.3.2000080	Fixed minor issues.	
1.3.610	Fixed issue with redirecting output and errors to files from user data.	
1.3.590	• Added missing instances types in the wallpaper. • Fixed an issue with drive letter mapping and disk installation.	

Version	Details	Release date
1.3.580	• Fixed `Get-Metadata` to use the default system proxy settings for web requests. • Added a special case for NVMe in disk initialization. • Fixed minor issues.	
1.3.550	Added a `-NoShutdown` option to enable Sysprep with no shutdown.	
1.3.540	Fixed minor issues.	
1.3.530	Fixed minor issues.	
1.3.521	Fixed minor issues.	
1.3.0	• Fixed a hexadecimal length issue for computer name cha nge. • Fixed a possible reboot loop for computer name change. • Fixed an issue in wallpaper setup.	
1.2.0	• Update to display information about installed operating system (OS) in EC2 system log. • Update to display EC2Launch and SSM Agent version in EC2 system log. • Fixed minor issues.	

Version	Details	Release date
1.1.2	• Update to display ENA driver information in EC2 system log. • Update to exclude Hyper-V from primary NIC filter logic. • Added AWS KMS server and port into registry key for KMS activation. • Improved wallpaper setup for multiple users. • Update to clear routes from persistent store. • Update to remove the z from Availability Zone in DNS suffix list. • Update to address an issue with the <runAsLocalSystem> tag in user data.	
1.1.1	Initial release.	

Use the EC2Config service to perform tasks during EC2 legacy Windows operating system instance launch

Note

EC2Config has reached the end of support. The operating system versions that it runs on are no longer supported by Microsoft. We strongly recommend that you upgrade to the latest launch agent.
The latest launch agent for Windows Server 2022 and later operating system versions is EC2Launch v2, which replaces both EC2Config and EC2Launch, and comes pre-installed on AWS Windows Server 2022 and 2025 AMIs. You can also manually install and configure the agent on Windows Server 2016 and 2019. For more information, see Install EC2Launch v2.

Windows AMIs for Windows Server versions prior to Windows Server 2016 include an optional service, the EC2Config service (`EC2Config.exe`). EC2Config starts when the instance boots and performs tasks during startup and each time you stop or start the instance. EC2Config can also perform tasks on demand. Some of these tasks are automatically enabled, while others must be enabled manually. Although optional, this service provides access to advanced features that aren't otherwise available. This service runs in the LocalSystem account.

The EC2Config service runs Sysprep, a Microsoft tool that enables you to create a customized Windows AMI that can be reused. When EC2Config calls Sysprep, it uses the files in `%ProgramFiles%\Amazon\EC2ConfigService\Settings` to determine which operations to perform. You can edit these files indirectly using the **EC2 Service Properties** system dialog, or directly using an XML editor or a text editor. However, there are some advanced settings that aren't available in the **Ec2 Service Properties** system dialog, so you must edit those entries directly.

If you create an AMI from an instance after updating its settings, the new settings are applied to any instance that's launched from the new AMI. For information about creating an AMI, see Create an Amazon EBS-backed AMI.

EC2Config uses settings files to control its operation. You can update these settings files using either a graphical tool or by directly editing XML files. The service binaries and additional files are contained in the `%ProgramFiles%\Amazon\EC2ConfigService` directory.

Contents

- EC2Config and AWS Systems Manager
- EC2Config tasks
- EC2Config settings files
- Install the latest version of EC2Config
- Configure .NET proxy settings for the EC2Config service
- Set EC2Config service properties from the system dialog on your EC2 Windows instance
- Troubleshoot issues with the EC2Config launch agent
- EC2Config version history

EC2Config and AWS Systems Manager

The EC2Config service processes Systems Manager requests on instances created from AMIs for versions of Windows Server prior to Windows Server 2016 that were published before November 2016.

Instances created from AMIs for versions of Windows Server prior to Windows Server 2016 that were published after November 2016 include the EC2Config service *and* SSM Agent. EC2Config performs all of the tasks described earlier, and SSM Agent processes requests for Systems Manager capabilities like Run Command and State Manager.

You can use Run Command to upgrade your existing instances to use to the latest version of the EC2Config service and SSM Agent. For more information, see Update SSM Agent using Run Command in the *AWS Systems Manager User Guide*.

EC2Config tasks

EC2Config runs initial startup tasks when the instance is first started and then disables them. To run these tasks again, you must explicitly enable them prior to shutting down the instance, or by running Sysprep manually. These tasks are as follows:

- Set a random, encrypted password for the administrator account.
- Generate and install the host certificate used for Remote Desktop Connection.
- Dynamically extend the operating system partition to include any unpartitioned space.
- Execute the specified user data (and Cloud-Init, if it's installed). For more information about specifying user data, see Run commands when you launch an EC2 instance with user data input.

EC2Config performs the following tasks every time the instance starts:

- Change the host name to match the private IP address in Hex notation (this task is disabled by default and must be enabled to run at instance start).
- Configure the key management server (AWS KMS), check for Windows activation status, and activate Windows as necessary.
- Mount all Amazon EBS volumes and instance store volumes, and map volume names to drive letters.
- Write event log entries to the console to help with troubleshooting (this task is disabled by default and must be enabled to run at instance start).
- Write to the console that Windows is ready.
- Add a custom route to the primary network adapter to enable the following IP addresses when a single NIC or multiple NICs are attached: `169.254.169.250`, `169.254.169.251`, and `169.254.169.254`. These addresses are used by Windows Activation and when you access instance metadata.

> **Note**
>
> If the Windows OS is configured to use IPv4, these IPv4 link-local addresses can be used. If the Windows OS has the IPv4 network protocol stack disabled and uses IPv6 instead, add `[fd00:ec2::250]` in place of `169.254.169.250` and `169.254.169.251`. Then add `[fd00:ec2::254]` in place of `169.254.169.254`.

EC2Config performs the following task every time a user logs in:

- Display wallpaper information to the desktop background.

While the instance is running, you can request that EC2Config perform the following task on demand:

- Run Sysprep and shut down the instance so that you can create an AMI from it. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.

EC2Config settings files

The settings files control the operation of the EC2Config service. These files are located in the `C:\Program Files\Amazon\Ec2ConfigService\Settings` directory:

- `ActivationSettings.xml`—Controls product activation using a key management server (AWS KMS).
- `AWS.EC2.Windows.CloudWatch.json`—Controls which performance counters to send to CloudWatch and which logs to send to CloudWatch Logs.
- `BundleConfig.xml`—Controls how EC2Config prepares an instance store-backed instance for AMI creation.
- `Config.xml`—Controls the primary settings.
- `DriveLetterConfig.xml`—Controls drive letter mappings.
- `EventLogConfig.xml`—Controls the event log information that's displayed on the console while the instance is booting.
- `WallpaperSettings.xml`—Controls the information that's displayed on the desktop background.

ActivationSettings.xml

This file contains settings that control product activation. When Windows boots, the EC2Config service checks whether Windows is already activated. If Windows is not already activated, it attempts to activate Windows by searching for the specified AWS KMS server.

- `SetAutodiscover`—Indicates whether to detect a AWS KMS automatically.
- `TargetKMSServer`—Stores the private IP address of a AWS KMS. The AWS KMS must be in the same Region as your instance.
- `DiscoverFromZone`—Discovers the AWS KMS server from the specified DNS zone.
- `ReadFromUserData`—Gets the AWS KMS server from UserData.
- `LegacySearchZones`—Discovers the AWS KMS server from the specified DNS zone.
- `DoActivate`—Attempts activation using the specified settings in the section. This value can be `true` or `false`.
- `LogResultToConsole`—Displays the result to the console.

BundleConfig.xml

This file contains settings that control how EC2Config prepares an instance for AMI creation.

- `AutoSysprep`—Indicates whether to use Sysprep automatically. Change the value to `Yes` to use Sysprep.
- `SetRDPCertificate`—Sets a self-signed certificate to the Remote Desktop server. This enables you to securely RDP into the instances. Change the value to `Yes` if the new instances should have the certificate.

  This setting is not used for instances with operating system versions prior to Windows Server 2016, because they can generate their own certificates.
- `SetPasswordAfterSysprep`—Sets a random password on a newly launched instance, encrypts it with the user launch key, and outputs the encrypted password to the console. Change the value of this setting to `No` if the new instances should not be set to a random encrypted password.

Config.xml

Plug-ins

- `Ec2SetPassword`—Generates a random encrypted password each time you launch an instance. This feature is disabled by default after the first launch so that reboots of this instance don't change a password set by the user. Change this setting to `Enabled` to continue to generate passwords each time you launch an instance.

  This setting is important if you are planning to create an AMI from your instance.
- `Ec2SetComputerName`—Sets the host name of the instance to a unique name based on the IP address of the instance and reboots the instance. To set your own host name, or prevent your existing host name from being modified, you must disable this setting.
- `Ec2InitializeDrives`—Initializes and formats all volumes during startup. This feature is enabled by default.
- `Ec2EventLog`—Displays event log entries in the console. By default, the three most recent error entries from the system event log are displayed. To specify the event log entries to display, edit the `EventLogConfig.xml` file located in the `EC2ConfigService\Settings` directory. For information about the settings in this file, see Eventlog Key.
- `Ec2ConfigureRDP`—Sets up a self-signed certificate on the instance, so users can securely access the instance using Remote Desktop. This setting is not used for instances with operating system versions prior to Windows Server 2016, because they can generate their own certificates.
- `Ec2OutputRDPCert`—Displays the Remote Desktop certificate information to the console so that the user can verify it against the thumbprint.
- `Ec2SetDriveLetter`—Sets the drive letters of the mounted volumes based on user-defined settings. By default, when an Amazon EBS volume is attached to an instance, it can be mounted using the drive letter on the instance. To specify your drive letter mappings, edit the `DriveLetterConfig.xml` file located in the `EC2ConfigService\Settings` directory.
- `Ec2WindowsActivate`—The plug-in handles Windows activation. It checks to see if Windows is activated. If not, it updates the AWS KMS client settings, and then activates Windows.

  To modify the AWS KMS settings, edit the `ActivationSettings.xml` file located in the `EC2ConfigService\Settings` directory.
- `Ec2DynamicBootVolumeSize`—Extends Disk 0/Volume 0 to include any unpartitioned space.
- `Ec2HandleUserData`—Creates and runs scripts created by the user on the first launch of an instance after Sysprep is run. Commands wrapped in script tags are saved to a batch file, and commands wrapped in PowerShell tags are saved to a .ps1 file (corresponds to the User Data checkbox on the Ec2 Service Properties system dialog).

- `Ec2ElasticGpuSetup`—Installs the Elastic GPU software package if the instance is associated with an elastic GPU.
- `Ec2FeatureLogging`—Sends Windows feature installation and corresponding service status to the console. Supported only for the Microsoft Hyper-V feature and corresponding vmms service.

Global Settings

- `ManageShutdown`—Ensures that instances launched from Amazon S3-backed AMIs do not terminate while running Sysprep.
- `SetDnsSuffixList`—Sets the DNS suffix of the network adapter for Amazon EC2. This allows DNS resolution of servers running in Amazon EC2 without providing the fully qualified domain name.

> **Note**
>
> This adds a DNS suffix lookup for the following domain and configures other standard suffixes. For more information about how launch agents set DNS suffixes, see Configure DNS Suffix for EC2 Windows launch agents.
>
> ```
> region.ec2-utilities.amazonaws.com
> ```

- `WaitForMetaDataAvailable`—Ensures that the EC2Config service will wait for metadata to be accessible and the network available before continuing with the boot. This check ensures that EC2Config can obtain information from metadata for activation and other plug-ins.
- `ShouldAddRoutes`—Adds a custom route to the primary network adapter to enable the following IP addresses when multiple NICs are attached: 169.254.169.250, 169.254.169.251, and 169.254.169.254. These addresses are used by Windows Activation and when you access instance metadata.
- `RemoveCredentialsfromSyspreponStartup`—Removes the administrator password from `Sysprep.xml` the next time the service starts. To ensure that this password persists, edit this setting.

DriveLetterConfig.xml

This file contains settings that control drive letter mappings. By default, a volume can be mapped to any available drive letter. You can mount a volume to a particular drive letter as follows.

```
<?xml version="1.0" standalone="yes"?>
<DriveLetterMapping>
  <Mapping>
    <VolumeName></VolumeName>
    <DriveLetter></DriveLetter>
  </Mapping>
  . . .
  <Mapping>
    <VolumeName></VolumeName>
    <DriveLetter></DriveLetter>
  </Mapping>
</DriveLetterMapping>
```

- `VolumeName`—The volume label. For example, *`My Volume`*. To specify a mapping for an instance storage volume, use the label `Temporary Storage X`, where `X` is a number from 0 to 25.
- `DriveLetter`—The drive letter. For example, *`M:`*. The mapping fails if the drive letter is already in use.

EventLogConfig.xml

This file contains settings that control the event log information that's displayed on the console while the instance is booting. By default, we display the three most recent error entries from the System event log.

- `Category`—The event log key to monitor.
- `ErrorType`—The event type (for example, `Error`, `Warning`, `Information`.)
- `NumEntries`—The number of events stored for this category.
- `LastMessageTime`—To prevent the same message from being pushed repeatedly, the service updates this value every time it pushes a message.
- `AppName`—The event source or application that logged the event.

WallpaperSettings.xml

This file contains settings that control the information that's displayed on the desktop background. The following information is displayed by default.

- `Hostname`—Displays the computer name.

- `Instance ID`—Displays the ID of the instance.
- `Public IP Address`—Displays the public IP address of the instance.
- `Private IP Address`—Displays the private IP address of the instance.
- `Availability Zone`—Displays the Availability Zone in which the instance is running.
- `Instance Size`—Displays the type of instance.
- `Architecture`—Displays the setting of the `PROCESSOR_ARCHITECTURE` environment variable.

You can remove any of the information that's displayed by default by deleting its entry. You can add additional instance metadata to display as follows.

```
<WallpaperInformation>
  <name>display_name</name>
  <source>metadata</source>
  <identifier>meta-data/path</identifier>
</WallpaperInformation>
```

You can add additional System environment variables to display as follows.

```
<WallpaperInformation>
  <name>display_name</name>
  <source>EnvironmentVariable</source>
  <identifier>variable-name</identifier>
</WallpaperInformation>
```

InitializeDrivesSettings.xml

This file contains settings that control how EC2Config initializes drives.

By default, EC2Config initialize drives that were not brought online with the operating system. You can customize the plugin as follows.

```
<InitializeDrivesSettings>
    <SettingsGroup>setting</SettingsGroup>
</InitializeDrivesSettings>
```

Use a settings group to specify how you want to initialize drives:

FormatWithTRIM

Enables the TRIM command when formatting drives. After a drive has been formatted and initialized, the system restores TRIM configuration.

Starting with EC2Config version 3.18, the TRIM command is disabled during the disk format operation by default. This improves formatting times. Use this setting to enable TRIM during the disk format operation for EC2Config version 3.18 and later.

FormatWithoutTRIM

Disables the TRIM command when formatting drives and improves formatting times in Windows. After a drive has been formatted and initialized, the system restores TRIM configuration.

DisableInitializeDrives

Disables formatting for new drives. Use this setting to initialize drives manually.

Install the latest version of EC2Config

> **Note**
>
> The latest launch agent for Windows Server 2022 and later operating system versions is EC2Launch v2, which replaces both EC2Config and EC2Launch. EC2Launch v2 comes pre-installed on AWS Windows Server 2022 and 2025 AMIs. You can also manually install and configure the agent on Windows Server 2016 and 2019. For more information, see Install EC2Launch v2.

For information about how to receive notifications for EC2Config updates, see Subscribe to EC2 Windows launch agent notifications. For information about the changes in each version, see the EC2Config version history.

Before you begin

- Verify that you have .NET framework 3.5 SP1 or greater.
- By default, Setup replaces your settings files with default settings files during installation and restarts the EC2Config service when the installation is completed. If you changed EC2Config service settings, copy the `config.xml` file from the `%Program Files%\Amazon`

`\Ec2ConfigService\Settings` directory. After you update the EC2Config service, you can restore this file to retain your configuration changes.

Verify the EC2Config version

Use the following procedure to verify the version of EC2Config that is installed on your instances.

To verify the installed version of EC2Config

1. Launch an instance from your AMI and connect to it.
2. In Control Panel, select **Programs and Features**.
3. In the list of installed programs, look for `Ec2ConfigService`. Its version number appears in the **Version** column.

Configure .NET proxy settings for the EC2Config service

You can configure the EC2Config service to communicate through a proxy using one of the following methods: the AWS SDK for .NET, the `system.net` element, or Microsoft Group Policy and Internet Explorer. Using the AWS SDK for .NET is the preferred method because you can specify sign-in credentials.

Methods

- Configure proxy settings using the AWS SDK for .NET (Preferred)
- Configure proxy settings using the system.net element
- Configure proxy settings using Microsoft Group Policy and Microsoft Internet Explorer

Configure proxy settings using the AWS SDK for .NET (Preferred)

You can configure proxy settings for the EC2Config service by specifying the `proxy` element in the `Ec2Config.exe.config` file. For more information, see Configuration Files Reference for AWS SDK for .NET.

To specify the proxy element in Ec2Config.exe.config

1. Edit the `Ec2Config.exe.config` file on an instance where you want the EC2Config service to communicate through a proxy. By default, the file is located in the following directory: `%ProgramFiles%\Amazon\Ec2ConfigService`.

2. Add the following `aws` element to the `configSections`. Do not add this to any existing `sectionGroups`.

   For EC2Config versions 3.17 or earlier

   ```
   <configSections>
      <section name="aws" type="Amazon.AWSSection, AWSSDK"/>
   </configSections>
   ```

   For EC2Config versions 3.18 or later

   ```
   <configSections>
        <section name="aws" type="Amazon.AWSSection, AWSSDK.Core"/>
   </configSections>
   ```

3. Add the following `aws` element to the `Ec2Config.exe.config` file.

   ```
   <aws>
      <proxy
        host="string value"
        port="string value"
        username="string value"
        password="string value" />
   </aws>
   ```

4. Save your changes.

Configure proxy settings using the system.net element

You can specify proxy settings in a `system.net` element in the `Ec2Config.exe.config` file. For more information, see defaultProxy element (network settings).

To specify the system.net element in Ec2Config.exe.config

1. Edit the `Ec2Config.exe.config` file on an instance where you want the EC2Config service to communicate through a proxy. By default, the file is located in the following directory: `%ProgramFiles%\Amazon\Ec2ConfigService`.
2. Add a `defaultProxy` entry to `system.net`. For more information, see defaultProxy element (network settings).

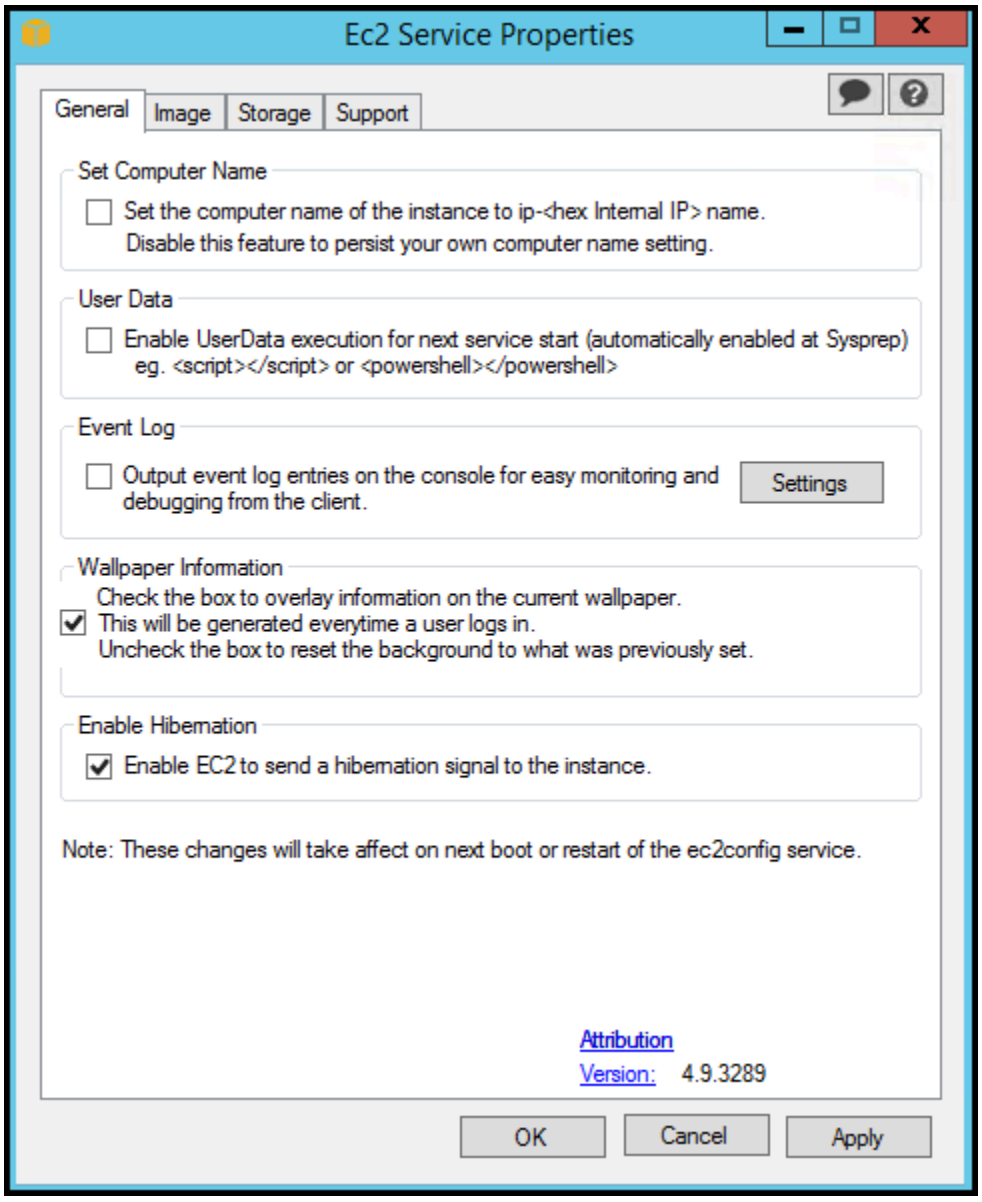
For example, the following configuration routes all traffic to use the proxy that is currently configured for Internet Explorer, with the exception of the metadata and licensing traffic, which will bypass the proxy.

```
<defaultProxy>
    <proxy usesystemdefault="true" />
    <bypasslist>
        <add address="169.254.169.250" />
        <add address="169.254.169.251" />
        <add address="169.254.169.254" />
        <add address="[fd00:ec2::250]" />
        <add address="[fd00:ec2::254]" />
    </bypasslist>
</defaultProxy>
```

3. Save your changes.

Configure proxy settings using Microsoft Group Policy and Microsoft Internet Explorer

The EC2Config service runs under the Local System user account. You can specify instance-wide proxy settings for this account in Internet Explorer after you change Group Policy settings on the instance.



To configure proxy settings using Group Policy and Internet Explorer

1. On an instance where you want the EC2Config service to communicate through a proxy, open a Command prompt as an Administrator, type **`gpedit.msc`**, and press Enter.
2. In the Local Group Policy Editor, under **Local Computer Policy**, choose **Computer Configuration**, **Administrative Templates**, **Windows Components**, **Internet Explorer**.
3. In the right-pane, choose **Make proxy settings per-machine (rather than per-user)** and then choose **Edit policy setting**.
4. Choose **Enabled**, and then choose **Apply**.
5. Open Internet Explorer, and then choose the **Tools** button.
6. Choose **Internet Option**, and then choose the **Connections** tab.
7. Choose **LAN settings**.
8. Under **Proxy server**, choose the **Use a proxy server for your LAN** option.
9. Specify address and port information and then choose **OK**.

Set EC2Config service properties from the system dialog on your EC2 Windows instance

The following procedure describes how to use the **EC2 Service Properties** system dialog to enable or disable settings.

1. Launch and connect to your Windows instance.
2. From the **Start** menu, choose **All Programs**, and then choose **EC2ConfigService Settings**.

3. On the **General** tab of the **EC2 Service Properties** system dialog, you can enable or disable the following settings.

Set Computer Name

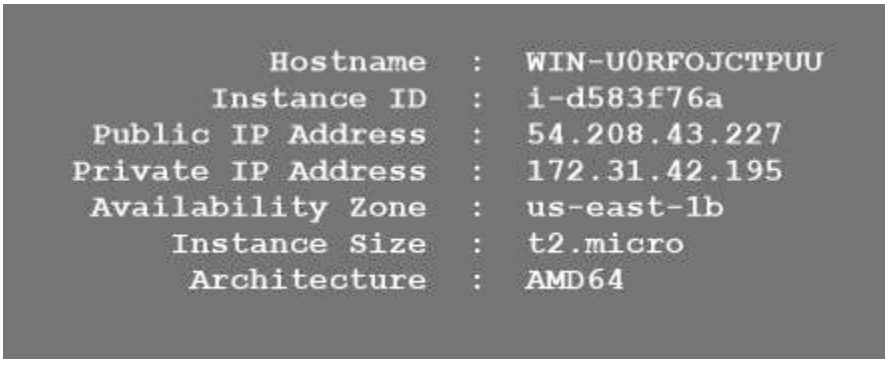
If this setting is enabled (it is disabled by default), the host name is compared to the current internal IP address at each boot; if the host name and internal IP address do not match, the host name is reset to contain the internal IP address and then the system reboots to pick up the new host name. To set your own host name, or to prevent your existing host name from being modified, do not enable this setting.

User Data

User data execution enables you to specify scripts in the instance metadata. By default, these scripts are run during the initial launch. You can also configure them to run the next time you reboot or start the instance, or every time you reboot or start the instance.

If you have a large script, we recommend that you use user data to download the script, and then run it.

For more information, see User data execution.



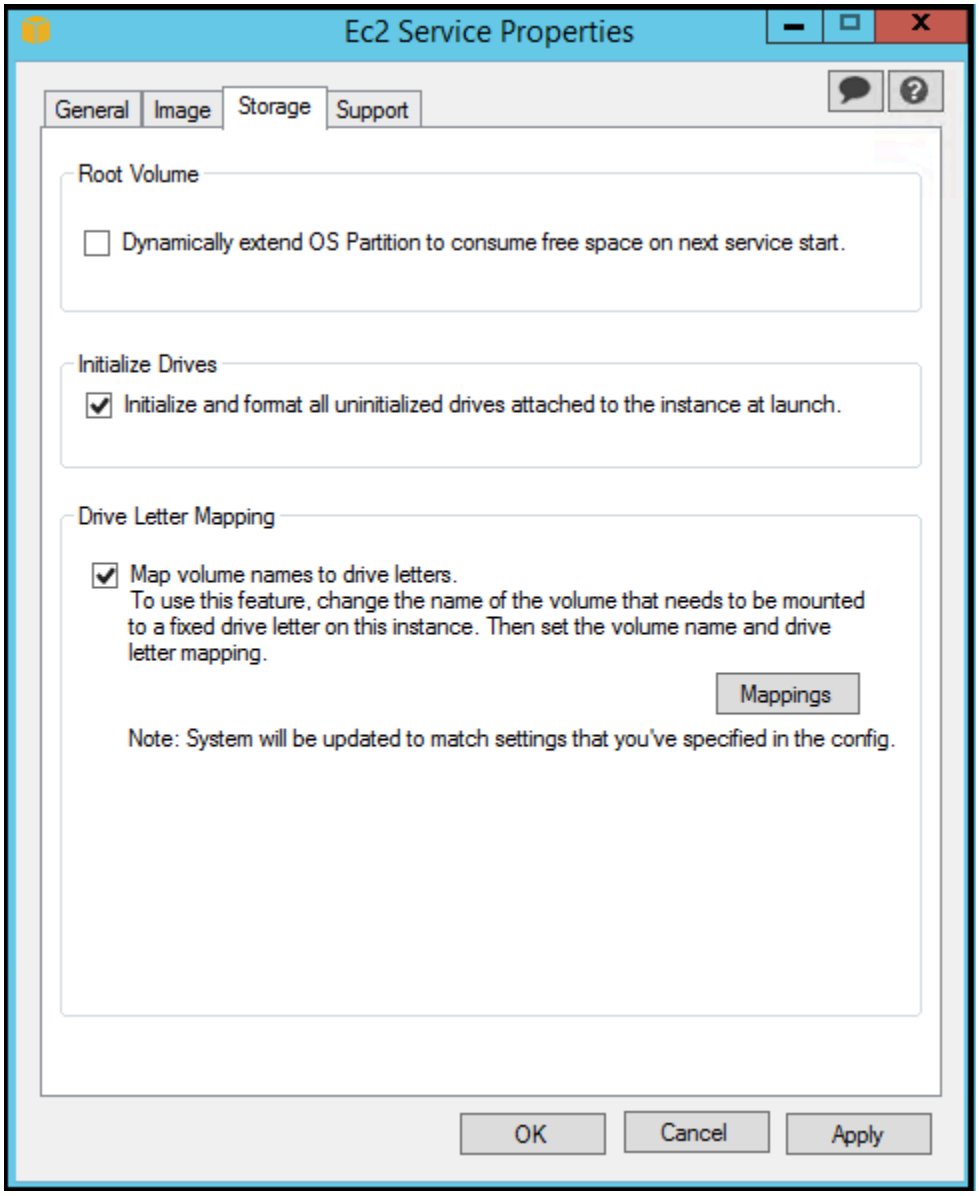
Event Log

Use this setting to display event log entries on the console during boot for easy monitoring and debugging.

Choose **Settings** to specify filters for the log entries sent to the console. The default filter sends the three most recent error entries from the system event log to the console.

Wallpaper Information

Use this setting to display system information on the desktop background. The following is an example of the information displayed on the desktop background.



The information displayed on the desktop background is controlled by the settings file `EC2ConfigService\Settings\WallpaperSettings.xml`.

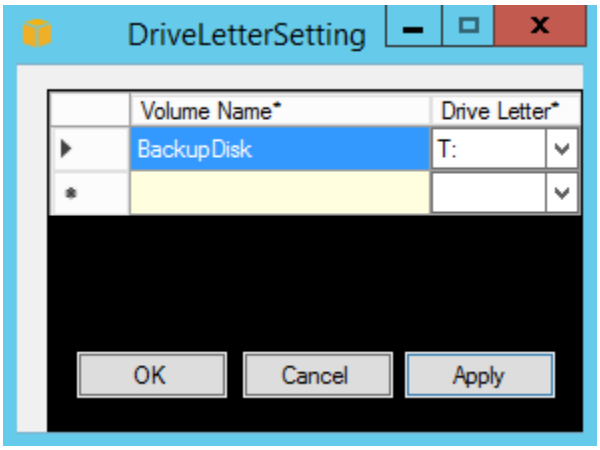
Enable Hibernation

Use this setting to allow EC2 to signal the operating system to perform hibernation.

4. Choose the **Storage** tab. You can enable or disable the following settings.

Root Volume

This setting dynamically extends Disk 0/Volume 0 to include any unpartitioned space. This can be useful when the instance is booted from a root volume that has a custom size.



Initialize Drives

This setting formats and mounts all volumes attached to the instance during start.

Drive Letter Mapping

The system maps the volumes attached to an instance to drive letters. For Amazon EBS volumes, the default is to assign drive letters going from D: to Z:. For instance store volumes, the default depends on the driver. AWS PV drivers and Citrix PV drivers assign instance store volumes drive letters going from Z: to A:. Red Hat drivers assign instance store volumes drive letters going from D: to Z:.

To choose the drive letters for your volumes, choose **Mappings**. In the **DriveLetterSetting** dialog box, specify the **Volume Name** and **Drive Letter** values for each volume, choose **Apply**, and then choose **OK**. We recommend that you select drive letters that avoid conflicts with drive letters that are likely to be in use, such as drive letters in the middle of the alphabet.

After you specify a drive letter mapping and attach a volume with same label as one of the volume names that you specified, EC2Config automatically assigns your specified drive letter to that volume. However, the drive letter mapping fails if the drive letter is already in use. Note that EC2Config doesn't change the drive letters of volumes that were already mounted when you specified the drive letter mapping.

5. To save your settings and continue working on them later, choose **OK** to close the **EC2 Service Properties** system dialog. If you have finished customizing your instance and want to create an AMI from that instance, see Create an Amazon EC2 AMI using Windows Sysprep.

Troubleshoot issues with the EC2Config launch agent

The following information can help you troubleshoot issues with the EC2Config service.

Update EC2Config on an unreachable instance

Use the following procedure to update the EC2Config service on a Windows Server instance that is inaccessible using Remote Desktop.

To update EC2Config on an Amazon EBS-backed Windows instance that you can't connect to

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Locate the affected instance. Select the instance and choose **Instance state**, and then choose **Stop instance**.

   > **Warning**
   >
   > When you stop an instance, the data on instance store volumes is lost. To preserve this data, back it up to persistent storage.

4. Choose **Launch instances** and create a temporary `t2.micro` instance in the same Availability Zone as the affected instance. Use a different AMI than the one that you used to launch the affected instance.

   > **Important**
   >
   > If you do not create the instance in the same Availability Zone as the affected instance you will not be able to attach the root volume of the affected instance to the new instance.

5. In the EC2 console, choose **Volumes**.
6. Locate the root volume of the affected instance. Detach the volume and then attach the volume to the temporary instance that you created earlier. Attach it with the default device name (xvdf).
7. Use Remote Desktop to connect to the temporary instance, and then use the Disk Management utility to make the volume available for use.
8.

9. On the temporary instance, open the Run dialog box, type **`regedit`**, and press Enter.
10. Choose `HKEY_LOCAL_MACHINE`. From the **File** menu, choose **Load Hive**. Choose the drive and then navigate to and open the following file: `Windows\System32\config\SOFTWARE`. When prompted, specify a key name.
11. Select the key you just loaded and navigate to `Microsoft\Windows\CurrentVersion`. Choose the `RunOnce` key. If this key doesn't exist, choose `CurrentVersion` from the context (right-click) menu, choose **New** and then choose **Key**. Name the key `RunOnce`.
12. From the context (right-click) menu choose the `RunOnce` key, choose **New** and then choose **String Value**. Enter `Ec2Install` as the name and `C:\Temp\Ec2Install.exe /quiet` as the data.
13. Choose the `HKEY_LOCAL_MACHINE\`*`specified key name`*`\Microsoft\Windows NT \CurrentVersion\Winlogon` key. From the context (right-click) menu choose **New**, and then choose **String Value**. Enter **`AutoAdminLogon`** as the name and **`1`** as the value data.
14. Choose the `HKEY_LOCAL_MACHINE\`*`specified key name`*`\Microsoft\Windows NT \CurrentVersion\Winlogon>` key. From the context (right-click) menu choose **New**, and then choose **String Value**. Enter **`DefaultUserName`** as the name and **`Administrator`** as the value data.
15. Choose the `HKEY_LOCAL_MACHINE\`*`specified key name`*`\Microsoft\Windows NT \CurrentVersion\Winlogon` key. From the context (right-click) menu choose **New**, and then choose **String Value**. Type **`DefaultPassword`** as the name and enter a password in the value data.
16. In the Registry Editor navigation pane, choose the temporary key that you created when you first opened Registry Editor.
17. From the **File** menu, choose **Unload Hive**.
18. In Disk Management Utility, choose the drive you attached earlier, open the context (right-click) menu, and choose **Offline**.
19. In the Amazon EC2 console, detach the affected volume from the temporary instance and reattach it to your instance with the device name `/dev/sda1`. You must specify this device name to designate the volume as a root volume.
20. Stop and start Amazon EC2 instances the instance.
21. After the instance starts, check the system log and verify that you see the message Windows is ready to use.

22. Open Registry Editor and choose `HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Windows NT\CurrentVersion\Winlogon`. Delete the String Value keys you created earlier: **AutoAdminLogon**, **DefaultUserName**, and **DefaultPassword**.
23. Delete or stop the temporary instance you created in this procedure.

EC2Config version history

The following table describes the released versions of EC2Config. For information about the updates for SSM Agent, see Systems Manager SSM Agent Release Notes.

> **Important**
>
> EC2Config has reached the end of support. Only the latest version of the EC2Config agent is available for download. Prior versions are marked as private.

Version	Details	Release date
4.9.5777	• Fixed issue where RSS configuration was set incorrectly for some instance types. • New version of SSM Agent `3.3.484.0` .	17 June 2024
4.9.5554	• Limit domain name devolution based on registry entry: `HKEY_LOCAL_MACHINE\System\CurrentControlSet\Services\Dnscache\Parameters\DomainNameDevolutionLevel` . • New version of SSM Agent `3.2.1630.0` .	4 October 2023
4.9.5467	• Added retry capability for discovering console port. • New version of SSM Agent `3.1.2282.0` .	1 August 2023
4.9.5288	• Updated AWS Core SDK to version `3.7.103.23` .	8 March 2023

Version	Details	Release date
	• Fixed issue where the `AWS-UpdateEC2Config` SSM document fails to update `EC2Config` on instances enabled with only IMDSv2. • New version of SSM Agent `3.1.2144.0` .	
4.9.5231	• New version of SSM Agent 3.1.1927.0.	14 February 2023
4.9.5103	• Fixed issue where ephemeral volumes are incorrectly identified on r5d and i4i instance families. • New version of SSM Agent 3.1.1856.0.	5 December 2022
4.9.5064	• Updated to use PCI segment information to select the console port. • Signed PowerShell scripts and added copyright headers. • Fixed primary network adapter selection logic. • New version of SSM Agent 3.1.1732.0.	16 November 2022
4.9.4588	• Updated IMDS wait logic to make only IMDSv2 requests. • Added libec2launch.dll launch-agent shared library. • New version of SSM Agent 3.1.1188.0.	31 May 2022
4.9.4556	• Added wait logic to ensure full initialization of NIC before use. • New version of Log4Net 2.0.14.0 picks up security patch. • New version of SSM Agent 3.1.1045.0 picks up security patch.	1 March 2022

Version	Details	Release date
4.9.4536	• Fixed issue where userdata crashes when the Temp folder is missing. • New version of SSM Agent 3.1.804.0.	31 January 2022
4.9.4508	• Fixed issue to correctly compute diskpart script path. • New version of SSM Agent 3.1.338.0.	6 October 2021
4.9.4500	• Updated `Install-EgpuManagerConfig` with IMDS v2 support. • Updated web links to use https. • New version of SSM Agent 3.1.282.0	7 September 2021
4.9.4419	• Fixed IMDS version 1 fallback logic • Updated all usage of Windows temp directory to EC2Config temp directory • New version of SSM Agent 3.0.1124.0	2 June 2021
4.9.4381	• Added support for SSM document schema version 2.2 in EC2ConfigUpdater • Added AWS Nitro Enclaves package version to console log • New version of SSM Agent 3.0.529.0	4 May 2021
4.9.4326	• Removed all links in the settings UI • This is the last EC2Config version that supports Windows Server 2008.	3 March 2021

Version	Details	Release date
4.9.4279	• Fixed security issue related to `Ec2ConfigMonitor` scheduled task • Fixed drive letter mapping issue and incorrect ephemeral disk count • Added `OsCurrentBuild` and `OsReleaseId` to console output • New version of SSM Agent 2.3.871.0	11 December 2020
4.9.4222	• Fixed IMDS version 1 fallback logic • New version of SSM Agent 2.3.842.0	7 April 2020
4.9.4122	• Added support for IMDS v2 • New version of SSM Agent 2.3.814.0	4 March 2020
4.9.3865	• Fixed issue detecting COM port for Windows Server 2008 R2 on metal instances • New version of SSM Agent 2.3.722.0	31 October 2019
4.9.3519	• New version of SSM Agent 2.3.634.0	18 June 2019
4.9.3429	• New version of SSM Agent 2.3.542.0	25 April 2019
4.9.3289	• New version of SSM Agent 2.3.444.0	11 February 2019
4.9.3270	• Added plugin for setting the monitor to never turn off to fix ACPI issues • SQL Server edition and version written to console • New version of SSM Agent 2.3.415.0	22 January 2019
4.9.3230	• Drive Letter Mapping description updated to better align to functionality • New version of SSM Agent 2.3.372.0	10 January 2019

Version	Details	Release date
4.9.3160	• Increased wait time for primary NIC • Added default configuration for RSS and Receive Queue settings for ENA devices • Disabled hibernation during Sysprep • New version of SSM Agent 2.3.344.0 • Upgraded AWS SDK to 3.3.29.13	15 December 2018
4.9.3067	• Improvements made to instance hibernation • New version of SSM Agent 2.3.235.0	8 November 2018
4.9.3034	• Added route 169.254.169.253/32 for DNS server • New version of SSM Agent 2.3.193.0	24 October 2018
4.9.2986	• Added signing for all EC2Config related binaries • New version of SSM Agent 2.3.136.0	11 October 2018
4.9.2953	New version of SSM Agent (2.3.117.0)	2 October 2018
4.9.2926	New version of SSM Agent (2.3.68.0)	18 September 2018
4.9.2905	• New version of SSM Agent (2.3.50.0) • Added route 169.254.169.123/32 to AMZN time service • Added route 169.254.169.249/32 to GRID license service • Fixed an issue causing EBS NVMe volumes to be marked as ephemeral	17 September 2018
4.9.2854	New version of SSM Agent (2.3.13.0)	17 August 2018
4.9.2831	New version of SSM Agent (2.2.916.0)	7 August 2018

Version	Details	Release date
4.9.2818	New version of SSM Agent (2.2.902.0)	31 July 2018
4.9.2756	New version of SSM Agent (2.2.800.0)	27 June 2018
4.9.2688	New version of SSM Agent (2.2.607.0)	25 May 2018
4.9.2660	New version of SSM Agent (2.2.546.0)	11 May 2018
4.9.2644	New version of SSM Agent (2.2.493.0)	26 April 2018
4.9.2586	New version of SSM Agent (2.2.392.0)	28 March 2018
4.9.2565	• New version of SSM Agent (2.2.355.0) • Fixed an issue on M5 and C5 instances (unable to find PV drivers) • Add console logging for instance type, newest PV drivers, and NVMe drivers	13 March 2018
4.9.2549	New version of SSM Agent (2.2.325.0)	8 March 2018
4.9.2461	New version of SSM Agent (2.2.257.0)	15 February 2018
4.9.2439	New version of SSM Agent (2.2.191.0)	6 February 2018
4.9.2400	New version of SSM Agent (2.2.160.0)	16 January 2018

Version	Details	Release date
4.9.2327	• New version of SSM Agent (2.2.120.0) • Added COM port discovery on Amazon EC2 bare metal instances • Added Hyper-V status logging on Amazon EC2 bare metal instances	2 January 2018
4.9.2294	New version of SSM Agent (2.2.103.0)	4 December 2017
4.9.2262	New version of SSM Agent (2.2.93.0)	15 November 2017
4.9.2246	New version of SSM Agent (2.2.82.0)	11 November 2017
4.9.2218	New version of SSM Agent (2.2.64.0)	29 October 2017
4.9.2212	New version of SSM Agent (2.2.58.0)	23 October 2017
4.9.2203	New version of SSM Agent (2.2.45.0)	19 October 2017
4.9.2188	New version of SSM Agent (2.2.30.0)	10 October 2017
4.9.2180	• New version of SSM Agent (2.2.24.0) • Added the Elastic GPU plugin for GPU instances	5 October 2017
4.9.2143	New version of SSM Agent (2.2.16.0)	1 October 2017
4.9.2140	New version of SSM Agent (2.1.10.0)	
4.9.2130	New version of SSM Agent (2.1.4.0)	

Version	Details	Release date
4.9.2106	New version of SSM Agent (2.0.952.0)	
4.9.2061	New version of SSM Agent (2.0.922.0)	
4.9.2047	New version of SSM Agent (2.0.913.0)	
4.9.2031	New version of SSM Agent (2.0.902.0)	
4.9.2016	• New version of SSM Agent (2.0.879.0) • Fixed the CloudWatch Logs directory path for Windows Server 2003	
4.9.1981	• New version of SSM Agent (2.0.847.0) • Fixed the issue with `important.txt` being generated in EBS volumes.	
4.9.1964	New version of SSM Agent (2.0.842.0)	
4.9.1951	• New version of SSM Agent (2.0.834.0) • Fixed the issue with drive letter not being mapped from Z: for ephemeral drives.	
4.9.1925	• New version of SSM Agent (2.0.822.0) • [Bug] This version is not a valid update target from SSM Agent v4.9.1775.	
4.9.1900	New version of SSM Agent (2.0.805.0)	

Version	Details	Release date
4.9.1876	• New version of SSM Agent (2.0.796.0) • Fixed an issue with output/error redirection for admin us erdata execution.	
4.9.1863	• New version of SSM Agent (2.0.790.0) • Fixed problems with attaching multiple EBS volumes to an Amazon EC2 instance. • Improved CloudWatch to take a configuration path, keeping the backwards compatibility.	
4.9.1791	New version of SSM Agent (2.0.767.0)	
4.9.1775	New version of SSM Agent (2.0.761.0)	
4.9.1752	New version of SSM Agent (2.0.755.0)	
4.9.1711	New version of SSM Agent (2.0.730.0)	
4.8.1676	New version of SSM Agent (2.0.716.0)	
4.7.1631	New version of SSM Agent (2.0.682.0)	
4.6.1579	• New version of SSM Agent (2.0.672.0) • Fixed agent update issue with v4.3, v4.4, and v4.5	
4.5.1534	New version of SSM Agent (2.0.645.1)	
4.4.1503	New version of SSM Agent (2.0.633.0)	
4.3.1472	New version of SSM Agent (2.0.617.1)	
4.2.1442	New version of SSM Agent (2.0.599.0)	

Version	Details	Release date
4.1.1378	New version of SSM Agent (2.0.558.0)	
4.0.1343	• Run Command, State Manager, the CloudWatch agent, and domain join support have been moved into another agent called SSM Agent. SSM Agent will be installed as part of the EC2Config upgrade. For more information, see EC2Config and AWS Systems Manager. • If you have a proxy set up in EC2Config, you will need to update your proxy settings for SSM Agent before upgrading. If you do not update the proxy settings, you will not be able to use Run Command to manage your instances. To avoid this, see the following information before updating to the newer version: Installing and Configuring SSM Agent on Windows Instances in the *AWS Systems Manager User Guide*. • If you previously enabled CloudWatch integration on your instances by using a local configuration file (`AWS.EC2.Windows.CloudWatch.json`), you will need to configure the file to work with SSM Agent.	
3.19.1153	• Re-enabled activation plugin for instances with old AWS KMS configuration. Skip activation for BYOL users. • Change default TRIM behavior to be disabled during disk format operation and added FormatWithTRIM for overriding InitializeDisks plugin with userdata.	
3.18.1118	• Fix to reliably add routes to the primary network adapter. • Updates to improve support for AWS services.	

Version	Details	Release date
3.17.1032	• Fixes duplicate system logs appearing when filters set to same category. • Fixes to prevent from hanging during disk initialization.	
3.16.930	Added support to log "Window is Ready to use" event to Windows Event Log on start.	
3.15.880	Fix to allow uploading Systems Manager Run Command output to S3 bucket names with '.' character.	
3.14.786	Added support to override InitializeDisks plugin settings. For example: To speed up SSD disk initialize, you can temporarily disable TRIM by specifying this in userdata: <InitializeDrivesSettings><SettingsGroup>FormatWithout TRIM</SettingsGroup></InitializeDrivesSettings	
3.13.727	Systems Manager Run Command - Fixes to process commands reliably after windows reboot.	
3.12.649	• Fix to gracefully handle reboot when running commands/ scripts. • Fix to reliably cancel running commands. • Add support for (optionally) uploading MSI logs to S3 when installing applications through Systems Manager Run Command.	

Version	Details	Release date
3.11.521	• Fixes to enable RDP thumbprint generation for Windows Server 2003. • Fixes to include timezone and UTC offset in the EC2Config log lines. • Systems Manager support to run Run Command commands in parallel. • Roll back previous change to bring partitioned disks online.	
3.10.442	• Fix Systems Manager configuration failures when installing MSI applications. • Fix to reliably bring storage disks online. • Updates to improve support for AWS services.	
3.9.359	• Fix in post Sysprep script to leave the configuration of windo ws update in a default state. • Fix the password generation plugin to improve the reliability in getting GPO password policy settings. • Restrict EC2Config/SSM log folder permissions to the local Administrators group. • Updates to improve support for AWS services.	

Version	Details	Release date
3.8.294	• Fixed an issue with CloudWatch that prevented logs from getting uploaded when not on primary drive. • Improved the disk initialization process by adding retry lo gic. • Added improved error handling when the SetPassword plugin occasionally failed during AMI creation. • Updates to improve support for AWS services.	
3.7.308	• Improvements to the ec2config-cli utility for config testing and troubleshooting within instance. • Avoid adding static routes for AWS KMS and meta-data service on an OpenVPN adapter. • Fixed an issue where user-data execution was not honoring the "persist" tag. • Improved error handling when logging to the EC2 console is not available. • Updates to improve support for AWS services.	
3.6.269	• Windows activation reliability fix to first use link local ad dress 169.254.0.250/251 for activating windows through AWS KMS • Improved proxy handling for Systems Manager, Windows Activation and Domain Join scenarios • Fixed an issue where duplicate lines of user accounts were added to the Sysprep answer file	

Version	Details	Release date
3.5.228	• Addressed a scenario where the CloudWatch plugin may consume excessive CPU and memory reading Windows Event Logs • Added a link to the CloudWatch configuration documentation in the EC2Config Settings UI	
3.4.212	• Fixes to EC2Config when used in combination with VM-Import. • Fixed service naming issue in the WiX installer.	
3.3.174	• Improved exception handling for Systems Manager and domain join failures. • Change to support Systems Manager SSM schema versioning. • Fixed formatting ephemeral disks on Win2K3. • Change to support configuring disk size greater than 2TB. • Reduced virtual memory usage by setting GC mode to default. • Support for downloading artifacts from UNC path in `aws:psModule` and `aws:application` plugin. • Improved logging for Windows activation plugin.	

Version	Details	Release date
3.2.97	• Performance improvements by delay loading Systems Manager SSM assemblies. • Improved exception handling for malformed sysprep 2008.xml. • Command line support for Systems Manager "Apply" configuration. • Change to support domain join when there is a pending computer rename. • Support for optional parameters in the `aws:applications` plugin. • Support for command array in `aws:psModule` plugin.	
3.0.54	• Enable support for Systems Manager. • Automatically domain join EC2 Windows instances to an AWS directory through Systems Manager. • Configure and upload CloudWatch logs/metrics through Systems Manager. • Install PowerShell modules through Systems Manager. • Install MSI applications through Systems Manager.	

Version	Details	Release date
2.4.233	• Added scheduled task to recover EC2Config from service startup failures. • Improvements to the Console log error messages. • Updates to improve support for AWS services.	
2.3.313	• Fixed an issue with large memory consumption in some cases when the CloudWatch Logs feature is enabled. • Fixed an upgrade bug so that ec2config versions lower than 2.1.19 can now upgrade to latest. • Updated COM port opening exception to be more friendly and useful in logs. • Ec2configServiceSettings UI disabled resizing and fixed the attribution and version display placement in UI.	
2.2.12	• Handled NullPointerException while querying a registry key for determining Windows Sysprep state which returned null occasionally. • Freed up unmanaged resources in finally block.	
2.2.11	Fixed a issue in CloudWatch plugin for handling empty log lines.	
2.2.10	• Removed configuring CloudWatch Logs settings through UI. • Enable users to define CloudWatch Logs settings in `%ProgramFiles%\Amazon\Ec2ConfigService\Settings\AWS.EC2.Windows.CloudWatch.json` file to allow future enhancements.	

Version	Details	Release date
2.2.9	Fixed unhandled exception and added logging.	
2.2.8	• Fixes Windows OS version check in EC2Config Installer to support Windows Server 2003 SP1 and later. • Fixes null value handling when reading registry keys related to updating Sysprep config files.	
2.2.7	• Added support for EC2Config to run during Sysprep execution for Windows 2008 and greater. • Improved exception handling and logging for better d iagnostics	
2.2.6	• Reduced the load on the instance and on CloudWatch Logs when uploading log events. • Addressed an upgrade issue where the CloudWatch Logs plug-in did not always stay enabled	
2.2.5	• Added support to upload logs to CloudWatch Log Service. • Fixed a race condition issue in Ec2OutputRDPCert plug-in • Changed EC2Config Service recovery option to Restart from TakeNoAction • Added more exception information when EC2Config Crashes	
2.2.4	• Fixed a typo in PostSysprep.cmd • Fixed the bug which EC2Config does not pin itself onto start menu for OS2012+	

Version	Details	Release date
2.2.3	• Added option to install EC2Config without service starting immediately upon install. To use, run 'Ec2Install.exe s tart=false' from the command prompt • Added parameter in wallpaper plugin to control adding/re moving wallpaper. To use, run 'Ec2WallpaperInfo.exe set' or 'Ec2WallpaperInfo.exe revert' from the command prompt • Added checking for RealTimeIsUniversal key, output i ncorrect settings of the RealTimeIsUniveral registry key to the Console • Removed EC2Config dependency on Windows temp folder • Removed UserData execution dependency on .Net 3.5	
2.2.2	• Added check to service stop behavior to check that res ources are being released • Fixed issue with long execution times when joined to domai n	
2.2.1	• Updated Installer to allow upgrades from older versions • Fixed Ec2WallpaperInfo bug in .Net4.5 only environment • Fixed intermittent driver detection bug • Added silent install option. Execute Ec2Install.exe with the '- q' option. eg: 'Ec2Install.exe -q'	
2.2.0	• Added support for .Net4 and .Net4.5 only environments • Updated Installer	

Version	Details	Release date
2.1.19	• Added ephemeral disk labeling support when using Intel network driver (eg. C3 instance Type). For more information, see Enhanced networking on Amazon EC2 instances. • Added AMI Origin Version and AMI Origin Name support to the console output • Made changes to the Console Output for consistent formatting/parsing • Updated Help File	
2.1.18	• Added EC2Config WMI Object for Completion notification (-Namespace root\Amazon -Class EC2_ConfigService) • Improved Performance of Startup WMI query with large Event Logs; could cause prolonged high CPU during initial execution	
2.1.17	• Fixed UserData execution issue with Standard Output and Standard Error buffer filling • Fixed incorrect RDP thumbprint sometimes appearing in Console Output for >= w2k8 OS • Console Output now contains 'RDPCERTIFICATE-SubjectName:' for Windows 2008+, which contains the machine name value • Added D:\ to Drive Letter Mapping dropdown • Moved Help button to top right and changed look/feel • Added Feedback survey link to top right	

Version	Details	Release date
2.1.16	• General Tab includes link to EC2Config download page for new Versions • Desktop Wallpaper overlay now stored in Users Local Appdata folder instead of My Documents to support MyDoc redirection • MSSQLServer name sync'd with system in Post-Sysprep script (2008+) • Reordered Application Folder (moved files to Plugin directory and removed duplicate files) • Changed System Log Output (Console): • *Moved to a date, name, value format for easier parsing (Please start migrating dependencies to new format) • *Added 'Ec2SetPassword' plugin status • *Added Sysprep Start and End times • Fixed issue of Ephemeral Disks not being labeled as 'Temporary Storage' for non-english Operating Systems • Fixed EC2Config Uninstall failure after running Sysprep	

Version	Details	Release date
2.1.15	• Optimized requests to the Metadata service • Metadata now bypass Proxy Settings • Ephemeral Disks labeled as 'Temporary Storage' and Impo rtant.txt placed on volume when found (Citrix PV drivers only). For more information, see Upgrade PV drivers on EC2 Windows instances. • Ephemeral Disks assigned drive letters from Z to A (Citrix PV drivers only) - assignment can be overwritten using Drive Le tter Mapping plugin with Volume labels 'Temporary Storage X' where x is a number 0-25) • UserData now runs immediately following 'Windows is Ready'	
2.1.14	Desktop wallpaper fixes	
2.1.13	• Desktop wallpaper will display hostname by default • Removed dependency on Windows Time service • Route added in cases where multiple IPs are assigned to a single interface	
2.1.11	• Changes made to Ec2Activation Plugin • -Verifies Activation status every 30 days • -If Grace Period has 90 days remaining (out of 180), re attempts activation	

Version	Details	Release date
2.1.10	• Desktop wallpaper overlay no longer persists with Sysprep or Shutdown without Sysprep • Userdata option to run on every service start with <persist>true</persist> • Changed location and name of /DisableWinUpdate.cmd to /Scripts/PostSysprep.cmd • Administrator password set to not expire by default in /Scripts/PostSysprep.cmd • Uninstall will remove EC2Config PostSysprep script from c:\windows\setup\script\CommandComplete.cmd • Add Route supports custom interface metrics	
2.1.9	UserData Execution no longer limited to 3851 Characters	

Version	Details	Release date
2.1.7	• OS Version and language identifier written to console • EC2Config version written to console • PV driver version written to console • Detection of Bug Check and output to the console on next boot when found • Option added to config.xml to persist Sysprep credentials • Add Route Retry logic in cases of ENI being unavailable at start • User Data execution PID written to console • Minimum generated password length retrieved from GPO • Set service start to retry 3 attempts • Added S3_DownloadFile.ps1 and S3_Upload file.ps1 examples to /Scripts folder	

Version	Details	Release date
2.1.6	• Version information added to General tab • Renamed the Bundle tab to Image • Simplified the process of specifying passwords and moved the password-related UI from the General tab to the Image tab • Renamed the Disk Settings tab to Storage • Added a Support tab with common tools for troubleshooting • Windows Server 2003 `sysprep.ini` set to extend OS partition by default • Added the private IP address to the wallpaper • Private IP address displayed on wallpaper • Added retry logic for Console output • Fixed Com port exception for metadata accessibility -- caused EC2Config to terminate before console output is displayed • Checks for activation status on every boot -- activates as necessary • Fixed issue of relative paths -- caused when manually executing wallpaper shortcut from startup folder; pointing to Administrator/logs • Fixed default background color for Windows Server 2003 user (other than Administrator)	

Version	Details	Release date
2.1.2	• Console timestamps in UTC (Zulu) • Removed appearance of hyperlink on Sysprep tab • Addition of feature to dynamically expand Root Volume on first boot for Windows 2008+ • When Set-Password is enabled, now automatically enables EC2Config to set the password • EC2Config checks activation status prior to running Sysprep (presents warning if not activated) • Windows Server 2003 `Sysprep.xml` now defaults to UTC timezone instead of Pacific • Randomized Activation Servers • Renamed Drive Mapping tab to Disk Settings • Moved Initialize Drives UI items from General to the Disk Set tings tab • Help button now points to HTML help file • Updated HTML help file with changes • Updated 'Note' text for Drive Letter Mappings • Added InstallUpdates.ps1 to /Scripts folder for automating Patches and cleanup prior to Sysprep	

Version	Details	Release date
2.1.0	• Desktop wallpaper displays instance information by default upon first logon (not disconnect/reconnect) • PowerShell can be run from the userdata by surrounding the code with <powershell></powershell>	

Use EC2 Fast Launch for your Windows instances

When you configure a Windows Server AMI for EC2 Fast Launch, Amazon EC2 creates a set of pre-provisioned snapshots to use for faster launching, as follows.

1. Amazon EC2 launches a set of temporary t3 instances, based on your settings.
2. As each temporary instance completes the standard launch steps, Amazon EC2 creates a pre-provisioned snapshot of the instance. It stores the snapshot in your Amazon S3 bucket.
3. When the snapshot is ready, Amazon EC2 terminates the associated t3 instance to keep resource costs as low as possible.
4. The next time Amazon EC2 launches an instance from the EC2 Fast Launch enabled AMI, it uses one of the snapshots to significantly reduce the time it takes to launch.

Amazon EC2 automatically replenishes the snapshots you have on hand as it uses them to launch instances from the EC2 Fast Launch enabled AMI.

Any account that has access to an AMI with EC2 Fast Launch enabled can benefit from reduced launch times. When the AMI owner grants access for you to launch instances, the pre-provisioned snapshots come from the AMI owner's account.

If an AMI that supports EC2 Fast Launch is shared with you, you can enable or disable faster launching on the shared AMI yourself. If you enable a shared AMI for EC2 Fast Launch, Amazon EC2 creates the pre-provisioned snapshots directly in your account. If you deplete the snapshots in your account, you can still use snapshots from the AMI owner's account.

> **Note**
>
> EC2 Fast Launch deletes pre-provisioned snapshots as soon as they're consumed by a launch to minimize storage costs and prevent reuse. However, if the deleted snapshots match a retention rule, Recycle Bin automatically retains them. We recommend that you review the scope of your Recycle Bin retention rules so that this doesn't happen. For more information, see Recycle Bin in the *Amazon EBS User Guide*.
> This feature is not the same as EBS fast snapshot restore. You must explicitly enable EBS fast snapshot restore on a per-snapshot basis, and it has its own associated costs.

The following video demonstrates how to configure your Windows AMI for faster launching with a quick overview of the related key terms and their definitions: Launching EC2 Windows instances up to 65% faster on AWS.

Resource costs

There is no service charge to configure Windows AMIs for EC2 Fast Launch. However, standard pricing applies for any underlying AWS resources that Amazon EC2 uses. To learn more about associated resource costs and how to manage them, see Manage costs for EC2 Fast Launch underlying resources.

Contents

- Monitor EC2 Fast Launch
- Service-linked role for EC2 Fast Launch
- Troubleshoot Windows EC2 Fast Launch

Key terms

The EC2 Fast Launch feature uses the following key terms:

Pre-provisioned snapshot

A snapshot of an instance that was launched from a Windows AMI with EC2 Fast Launch enabled, and that has completed the following Windows launch steps, rebooting as required.

- Sysprep specialize
- Windows Out of Box Experience (OOBE)

When these steps are complete, EC2 Fast Launch stops the instance, and creates a snapshot that is later used for faster launching from the AMI, based on your configuration.

Launch frequency

Controls the number of pre-provisioned snapshots that Amazon EC2 can launch within the specified timeframe. When you enable EC2 Fast Launch for your AMI, Amazon EC2 creates the initial set of pre-provisioned snapshots in the background. For example, if the launch frequency is set to five launches per hour, which is the default, then EC2 Fast Launch creates an initial set of five pre-provisioned snapshots.

When Amazon EC2 launches an instance from an AMI with EC2 Fast Launch enabled, it uses one of the pre-provisioned snapshots to reduce the launch time. As snapshots are used, they are automatically replenished, up to the number specified by the launch frequency.

If you expect a spike in the number of instances that are launched from your AMI – during a special event, for example – you can increase the launch frequency in advance to cover the additional instances that you'll need. When your launch rate returns to normal, you can adjust the frequency back down.

When you experience a higher number of launches than anticipated, you might use up all the pre-provisioned snapshots that you have available. This doesn't cause any launches to fail. However, it can result in some instances going through the standard launch process, until snapshots can be replenished.

Target resource count

The number of pre-provisioned snapshots to keep on hand for an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled.

Max parallel launches

Controls how many instances Amazon EC2 can launch at the same time to create the pre-provisioned snapshots for EC2 Fast Launch. If your target resource count is higher than the

maximum parallel launches that you've configured, then Amazon EC2 launches the number of instances specified by **Max parallel launches** to start creating the snapshots. As those instances complete the process, Amazon EC2 takes the snapshot and stops the instance. Then it continues to launch more instances until the total number of snapshots available has reached the target resource count. The value for **Max parallel launches** must be 6 or greater.

EC2 Fast Launch prerequisites for Windows

Before you set up EC2 Fast Launch, verify that you've met the following prerequisites that are required to create snapshots for the AMIs in your AWS account:

- If you provide a custom launch template when you configure EC2 Fast Launch, the service uses the VPC and other configuration settings that you've defined in the launch template. For more information, see Use a launch template when you set up EC2 Fast Launch.
- If you don't use a custom launch template to configure your settings, you must attach the EC2FastLaunchFullAccess policy to your current IAM role before you enable EC2 Fast Launch. Then the service automatically creates an CloudFormation stack with the following resources in your AWS account.
  - A virtual private cloud (VPC)
  - Private subnets across multiple Availability Zones
  - A launch template configured with Instance Metadata Service Version 2 (IMDSv2)
  - A security group with no inbound or outbound rules
- Private EC2 Fast Launch AMIs must support user data script execution.
- To configure EC2 Fast Launch for an AMI, you must create the AMI using **Sysprep** with the shutdown option. The EC2 Fast Launch feature doesn't currently support AMIs that were created from a running instance.

  To create an AMI using **Sysprep**, see Create an Amazon EC2 AMI using Windows Sysprep.
- To enable EC2 Fast Launch for an encrypted AMI that uses a customer managed key for encryption, you must grant the service-linked role for EC2 Fast Launch permission to use the CMK. For more information, see the section called “Access to customer managed keys”.
- The default quota for **Max parallel launches** across all AMIs in an AWS account is 40 per Region. You can request a Service Quotas increase for your account, as follows.

  1. Open the Service Quotas console at https://eusc-de-east-1.console.amazonaws-eusc.eu/servicequotas/.

2. In the navigation pane, choose AWS services.
3. In the search bar, enter **EC2 Fast Launch**, and select the result.
4. Select the link for **Parallel instance launches** to open the service quota detail page.
5. Choose **Request increase at account level**.

For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

Configure EC2 Fast Launch settings for your Amazon EC2 Windows Server AMI

You can configure EC2 Fast Launch for Windows AMIs that you own, or AMIs that are shared with you from the AWS Management Console, API, SDKs, CloudFormation, or AWS Command Line Interface (AWS CLI). Before you configure EC2 Fast Launch, verify that your AMI meets all of the prerequisites that are required to create the pre-provisioned snapshots. For more information, see EC2 Fast Launch prerequisites for Windows.

When you enable faster launching for Windows instances, Amazon EC2 checks to make sure that you have the required permissions to launch instances from the specified AMI and Launch Template (if provided), including permissions for encrypted AMIs. To prevent errors during the instance launch process, the service validates your permissions before EC2 Fast Launch is enabled. If you don't have the required permissions, the service returns an error, and does not enable EC2 Fast Launch.

EC2 Fast Launch integrates with EC2 Image Builder to help you create custom images with EC2 Fast Launch enabled. For more information, see Create distribution settings for a Windows AMI with EC2 Fast Launch enabled (AWS CLI) in the *EC2 Image Builder User Guide*.

Enable EC2 Fast Launch

Before changing these settings, make sure that your AMI, and the Region that you run in meet all EC2 Fast Launch prerequisites for Windows.

Console

To enable EC2 Fast Launch

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, under **Images**, choose **AMIs**.
3. Choose the AMI to update by selecting the check box next to the **Name**.

4. From the **Actions** menu above the list of AMIs, choose **Configure fast launch**. This opens the **Configure fast launch** page, where you configure the settings for EC2 Fast Launch.
5. To start using pre-provisioned snapshots to launch instances from your Windows AMI faster, select the **Enable fast launch for Windows** checkbox.
6. From the **Set anticipated launch frequency** drop-down list, choose a value to specify the number of snapshots that are created and maintained to cover your expected instance launch volume.
7. When you're done making changes, choose **Save changes**.

> **Note**
>
> If you need to use a launch template to specify a VPC, or to configure metadata settings for IMDSv2, see Use a launch template when you set up EC2 Fast Launch.

AWS CLI

To enable EC2 Fast Launch

Use the following enable-fast-launch command to enable EC2 Fast Launch for the specified AMI, launching six parallel instances for pre-provisioning.

```
aws ec2 enable-fast-launch \
    --image-id ami-0abcdef1234567890  \
    --max-parallel-launches 6 \
    --resource-type snapshot
```

The following is example output.

```
{
 "ImageId": "ami-0abcdef1234567890",
 "ResourceType": "snapshot",
 "SnapshotConfiguration": {
     "TargetResourceCount": 10
 },
 "LaunchTemplate": {},
 "MaxParallelLaunches": 6,
 "OwnerId": "0123456789123",
```

```
 "State": "enabling",
 "StateTransitionReason": "Client.UserInitiated",
 "StateTransitionTime": "2022-01-27T22:16:03.199000+00:00"
}
```

PowerShell

To enable EC2 Fast Launch

Use the Enable-EC2FastLaunch cmdlet to enable EC2 Fast Launch for the specified AMI, launching six parallel instances for pre-provisioning.

```
Enable-EC2FastLaunch `
 -ImageId ami-0abcdef1234567890 `
 -MaxParallelLaunch 6 `
 -Region us-west-2 `
 -ResourceType snapshot
```

The following is example output.

```
ImageId               : ami-0abcdef1234567890
 LaunchTemplate        :
 MaxParallelLaunches   : 6
 OwnerId               : 0123456789123
 ResourceType          : snapshot
 SnapshotConfiguration : Amazon.EC2.Model.FastLaunchSnapshotConfigurationResponse
 State                 : enabling
 StateTransitionReason : Client.UserInitiated
 StateTransitionTime   : 2/25/2022 12:24:11 PM
```

Disable EC2 Fast Launch

Before changing these settings, make sure that your AMI, and the Region that you run in meet all EC2 Fast Launch prerequisites for Windows.

Console

To disable EC2 Fast Launch

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, under **Images**, choose **AMIs**.

3. Choose the AMI to update by selecting the check box next to the **Name**.
4. From the **Actions** menu above the list of AMIs, choose **Configure fast launch**. This opens the **Configure fast launch** page, where you configure the settings for EC2 Fast Launch.
5. Clear the **Enable fast launch for Windows** checkbox to disable EC2 Fast Launch and to remove pre-provisioned snapshots. This results in the AMI using the standard launch process for each instance, going forward.

   > **Note**
   >
   > When you disable Windows image optimization, any existing pre-provisioned snapshots are automatically deleted. This step must be completed before you can start using the feature again.

6. When you're done making changes, choose **Save changes**.

AWS CLI

To disable EC2 Fast Launch

Use the following disable-fast-launch command to disable EC2 Fast Launch on the specified AMI, and clean up existing pre-provisioned snapshots.

```
aws ec2 disable-fast-launch --image-id ami-01234567890abcedf
```

The following is example output.

```
{
    "ImageId": "ami-01234567890abcedf",
    "ResourceType": "snapshot",
    "SnapshotConfiguration": {},
    "LaunchTemplate": {
        "LaunchTemplateId": "lt-01234567890abcedf",
        "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
        "Version": "1"
    },
    "MaxParallelLaunches": 6,
    "OwnerId": "0123456789123",
    "State": "disabling",
```

```
    "StateTransitionReason": "Client.UserInitiated",
    "StateTransitionTime": "2022-01-27T22:47:29.265000+00:00"
}
```

PowerShell

To disable EC2 Fast Launch

Use the Disable-EC2FastLaunch cmdlet to disable EC2 Fast Launch on the specified AMI, and clean up existing pre-provisioned snapshots.

```
Disable-EC2FastLaunch -ImageId ami-0abcdef1234567890
```

The following is example output.

```
ImageId               : ami-0abcdef1234567890
 LaunchTemplate        :
 Amazon.EC2.Model.FastLaunchLaunchTemplateSpecificationResponse
 MaxParallelLaunches   : 6
 OwnerId               : 0123456789123
 ResourceType          : snapshot
 SnapshotConfiguration :
 State                 : disabling
 StateTransitionReason : Client.UserInitiated
 StateTransitionTime   : 2/25/2022 1:10:08 PM
```

Use a launch template when you set up EC2 Fast Launch

With a launch template, you can configure a set of launch parameters that Amazon EC2 uses each time it launches an instance from that template. You can specify such things as an AMI to use for your base image, instance types, storage, network settings, and more.

Launch templates are optional, except for the following specific cases, where you must use a launch template for your Windows AMI when you configure faster launching:

- You must use a launch template to specify an existing VPC for your Windows AMI. This doesn't apply if you use the default VPC for your AWS account.
- If your account includes a policy that enforces IMDSv2 for Amazon EC2 instances, you must create a launch template that specifies the metadata configuration to enforce IMDSv2.

Use the launch template that includes your metadata configuration from the EC2 console, or when you run the enable-fast-launch command in the AWS CLI, or call the EnableFastLaunch API action.

EC2 Fast Launch doesn't support the following configuration when you use a launch template. If you use a launch template for EC2 Fast Launch, you must not specify any of the following:

- User data scripts
- Termination protection
- Disabled metadata
- Spot option
- Shutdown behavior that terminates the instance
- Resource tags for network interface, elastic graphic, or spot instance requests

Specify a VPC

Step 1: Create a launch template

Create a launch template that specifies the following details for your Windows instances:

- The VPC subnet.
- An instance type of `t3.xlarge`.

For more information, see Create an Amazon EC2 launch template.

Step 2: Specify the launch template for your EC2 Fast Launch AMI

Console

To specify the launch template for EC2 Fast Launch

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, under **Images**, choose **AMIs**.
3. Choose the AMI to update by selecting the check box next to the **Name**.
4. From the **Actions** menu above the list of AMIs, choose **Configure fast launch**. This opens the **Configure fast launch** page, where you configure the settings for EC2 Fast Launch.

5. The **Launch template** box performs a filtered search that finds launch templates in your account in the current Region that match the text you've entered. Specify all or part of the launch template name or ID in the box to show a list of matching launch templates. For example, if you enter `fast` in the box, Amazon EC2 finds all of the launch templates in your account in the current Region that have "fast" in the name.

   To create a new launch template, you can choose **Create launch template**.
6. When you select a launch template, Amazon EC2 shows the default version for that template in the **Source template version** box. To specify a different version, highlight the default version to replace it, and enter the version number you want in the box.
7. When you're done making changes, choose **Save changes**.

AWS CLI

To specify the launch template for EC2 Fast Launch

Use the enable-fast-launch command with the `--launch-template` option, specifying either the name or the ID of the launch template.

```
--launch-template LaunchTemplateName=my-launch-template
```

PowerShell

To specify the launch template for EC2 Fast Launch

Use the Enable-EC2FastLaunch cmdlet with the `-LaunchTemplate_LaunchTemplateId` or `-LaunchTemplate_LaunchTemplateName` parameter.

```
-LaunchTemplate_LaunchTemplateName my-launch-template
```

For more information about EC2 launch templates, see Store instance launch parameters in Amazon EC2 launch templates.

Permissions checks for EC2 Fast Launch

When you enable EC2 Fast Launch with a launch template, you can specify a numbered version of the template. You can also use the `$Latest` or `$Default` version. If you use one of the aliases, the

alias can override the `ec2:RunInstances` and `iam:PassRole` permissions that you intended to restrict.

When you enable EC2 Fast Launch, Amazon EC2 checks your permissions against the current launch template version. `$Latest` and `$Default` each resolve to a specific version at that time. This check runs before Amazon EC2 enables the feature. It validates the permissions required to launch instances, such as the `ec2:RunInstances` and `iam:PassRole` permissions. To do this, EC2 Fast Launch issues a `RunInstances` dry run call that checks your permissions without launching an instance. If your permissions don't allow a required action, Amazon EC2 fails the request and returns an error that describes the missing permission. Amazon EC2 does not enable EC2 Fast Launch.

After this initial check is complete, EC2 Fast Launch creates the pre-provisioned snapshots in the background. It then launches instances by using the permissions of its service-linked role. Each time it launches an instance, it uses the version that `$Latest` or `$Default` resolves to at that time. This is true even if the version has changed after the initial check. It does not recheck your permissions. As a result, someone who can update the launch template could pass an IAM role or instance profile to an instance. This can happen even if they don't have the `iam:PassRole` permission for that role.

To make sure that Amazon EC2 always uses the version it validated when you enabled the feature, specify a numbered launch template version. Do not use `$Latest` or `$Default`.

If you configure EC2 Fast Launch to use the `$Latest` or `$Default` launch template version, we recommend that you limit who can create and manage launch template versions. Use IAM policies to restrict access to actions such as `ec2:CreateLaunchTemplateVersion` and `ec2:ModifyLaunchTemplate`.

View AMIs with EC2 Fast Launch enabled

You can use the describe-fast-launch-images command in the AWS CLI, or the Get-EC2FastLaunchImage Tools for PowerShell Cmdlet to get details for AMIs that have EC2 Fast Launch enabled.

Amazon EC2 provides the following details for each Windows AMI that is returned in the results:

- The image ID for an AMI with EC2 Fast Launch enabled.
- The resource type that is used for pre-provisioning the associated Windows AMI. Supported value: `snapshot`.

- The snapshot configuration, which is a group of parameters that configure pre-provisioning for the associated Windows AMI using snapshots.
- Launch template information, including the ID, name, and version of the launch template that the associated AMI uses when it launches Window instances from pre-provisioned snapshots.
- The maximum number of instances that can be launched at the same time for creating resources.
- The owner ID for the associated AMI. This is not populated for AMIs that are shared with you.
- The current state of EC2 Fast Launch for the associated AMI. Supported values include: `enabling | enabling-failed | enabled | enabled-failed | disabling | disabling-failed`.

> **Note**
>
> You can also see the current state displayed in the **Manage image optimization** page in the EC2 console, as **Image optimization state**.

- The reason that EC2 Fast Launch for the associated AMI changed to the current state.
- The time that EC2 Fast Launch for the associated AMI changed to the current state.

AWS CLI

To find AMIs configured for EC2 Fast Launch

Use the following describe-fast-launch-images command to describe the details for each of the AMIs in the account that are configured for EC2 Fast Launch. In this example, only one AMI in the account is configured for EC2 Fast Launch.

```
aws ec2 describe-fast-launch-images
```

The following is example output.

```
{
    "FastLaunchImages": [
        {
            "ImageId": "ami-01234567890abcedf",
            "ResourceType": "snapshot",
            "SnapshotConfiguration": {},
            "LaunchTemplate": {
                "LaunchTemplateId": "lt-01234567890abcedf",
```

```
                "LaunchTemplateName": "EC2FastLaunchDefaultResourceCreation-
a8c6215d-94e6-441b-9272-dbd1f87b07e2",
                "Version": "1"
            },
            "MaxParallelLaunches": 6,
            "OwnerId": "0123456789123",
            "State": "enabled",
            "StateTransitionReason": "Client.UserInitiated",
            "StateTransitionTime": "2022-01-27T22:20:06.552000+00:00"
        }
    ]
}
```

PowerShell

To find AMIs configured for EC2 Fast Launch

Use the following Get-EC2FastLaunchImage cmdlet to describe the details for each of the AMIs in the account that are configured for EC2 Fast Launch. In this example, only one AMI in the account is configured for EC2 Fast Launch.

```
Get-EC2FastLaunchImage -ImageId ami-0abcdef1234567890
```

The following is example output.

```
ImageId               : ami-0abcdef1234567890
LaunchTemplate        :

Manage costs for EC2 Fast Launch underlying resources

There is no service charge to configure Windows AMIs for EC2 Fast Launch. However, when you enable EC2 Fast Launch for an Amazon EC2 Windows AMI, standard pricing applies for underlying AWS resources that Amazon EC2 uses to prepare and store the pre-provisioned snapshots. You can

configure cost allocation tags to help you track and manage the costs that are associated with EC2 Fast Launch resources. For more information about how to configure cost allocation tags, see Track EC2 Fast Launch costs on your bill.

The following example demonstrates how the costs associated with EC2 Fast Launch snapshots costs might be allocated.

Example scenario: The AtoZ Example company has a Windows AMI with a 50 GiB EBS root volume. They enable EC2 Fast Launch for their AMI, and set the target resource count to five. Over the course of a month, using EC2 Fast Launch for their AMI costs them around $5.00, and the cost breakdown is as follows:

1. When AtoZ Example enables EC2 Fast Launch, Amazon EC2 launches five small instances. Each instance runs through the Sysprep and OOBE Windows launch steps, rebooting as required. This takes several minutes for each instance (time can vary, based on how busy that Region or Availability Zone (AZ) is, and on the size of the AMI).

   Costs

   - Instance runtime costs (or minimum runtime, if applicable): five instances
   - Volume costs: five EBS root volumes
2. When the pre-provisioning process completes, Amazon EC2 takes a snapshot of the instance, which it stores in Amazon S3. Snapshots are typically stored for 4–8 hours before they are consumed by a launch. In this case, the cost is roughly $0.02 to $0.05 per snapshot.

   Costs

   - Snapshot storage (Amazon S3): five snapshots
3. After Amazon EC2 takes the snapshot, it stops the instance. At that point, the instance is no longer accruing costs. However EBS volume costs continue to accrue.

   Costs

   - EBS volumes: costs continue for the associated EBS root volumes.

> **Note**
>
> The costs shown here are for demonstration purposes only. Your costs will vary, depending on your AMI configuration and pricing plan.

Track EC2 Fast Launch costs on your bill

Cost allocation tags can help you organize your AWS bill to reflect the costs associated with EC2 Fast Launch. You can use the following tag that Amazon EC2 adds to the resources it creates when it prepares and stores pre-provisioned snapshots for EC2 Fast Launch:

Tag key: `CreatedBy`, **Value:** `EC2 Fast Launch`

After you activate the tag in the Billing and Cost Management console, and set up your detailed billing report, the `user:CreatedBy` column appears on the report. The column includes values from all services. However, if you download the CSV file, you can import the data into a spreadsheet, and filter for `EC2 Fast Launch` in the value. This information also appears in the AWS Cost and Usage Report when the tag is activated.

Step 1: Activate user-defined cost allocation tags

To include resource tags in your cost reports, you must first activate the tag in the Billing and Cost Management console. For more information, see Activating User-Defined Cost Allocation Tags in the *AWS Billing and Cost Management User Guide*.

> **Note**
>
> Activation can take up to 24 hours.

Step 2: Set up a cost report

If you already have a cost report set up, a column for your tag appears the next time the report runs after activation is complete. To set up cost reports for the first time, choose one of the following.

- See Setting up a monthly cost allocation report in the *AWS Billing and Cost Management User Guide*.
- See Creating Cost and Usage Reports in the *AWS Cost and Usage Report User Guide*.

> **Note**
>
> It can take up to 24 hours for AWS to start delivering reports to your S3 bucket.

You can configure EC2 Fast Launch for Windows AMIs that you own, or AMIs that are shared with you from the Amazon EC2 console, API, SDKs, CloudFormation, or **ec2** commands in the AWS CLI. The following sections cover configuration steps for the Amazon EC2 console and AWS CLI.

You can also create custom Windows AMIs that are configured for EC2 Fast Launch with EC2 Image Builder. For more information, see Create distribution settings for a Windows AMI with EC2 Fast Launch enabled (AWS CLI).

Monitor EC2 Fast Launch

This section covers how to monitor the Amazon EC2 Windows Server AMIs in your account that have EC2 Fast Launch enabled.

Monitor EC2 Fast Launch state changes with EventBridge

When the state changes for a Windows AMI with EC2 Fast Launch enabled, Amazon EC2 generates an `EC2 Fast Launch State-change Notification` event. Then Amazon EC2 sends the state change event to Amazon EventBridge (formerly known as Amazon CloudWatch Events).

You can create EventBridge rules that trigger one or more actions in response to the state change event. For example, you can create an EventBridge rule that detects when EC2 Fast Launch is enabled and performs the following actions:

- Sends a message to an Amazon SNS topic that notifies its subscribers.
- Invokes a Lambda function that performs some action.
- Sends the state change data to Amazon Data Firehose for analytics.

For more information, see Creating Amazon EventBridge rules that react to events in the *Amazon EventBridge User Guide*.

State change events

The EC2 Fast Launch feature emits JSON formatted state change events on a best-effort basis. Amazon EC2 sends the events to EventBridge in near real time. This section describes the event fields and shows an example of the event format.

`EC2 Fast Launch State-change Notification`

imageId

Identifies the AMI with the EC2 Fast Launch state change.

resourceType

The type of resource to use for pre-provisioning. Supported value: `snapshot`. The default value is `snapshot`.

state

The current state of the EC2 Fast Launch feature for the specified AMI. Valid values include the following:

- **enabling** – You've enabled the EC2 Fast Launch feature for the AMI, and Amazon EC2 has started creating snapshots for the pre-provisioning process.
- **enabling-failed** – Something went wrong that caused the pre-provisioning process to fail the first time that you enabled the EC2 Fast Launch for an AMI. This can happen anytime during the pre-provisioning process.
- **enabled** – The EC2 Fast Launch feature is enabled. The state changes to `enabled` as soon as Amazon EC2 creates the first pre-provisioned snapshot for a newly enabled EC2 Fast Launch AMI. If the AMI was already enabled and goes through pre-provisioning again, the state change happens right away.
- **enabled-failed** – This state applies only if this is not the first time your EC2 Fast Launch AMI goes through the pre-provisioning process. This can happen if the EC2 Fast Launch feature is disabled and then later enabled again, or if there is a configuration change or other error after pre-provisioning is completed for the first time.
- **disabling** – The AMI owner has turned off the EC2 Fast Launch feature for the AMI, and Amazon EC2 has started the clean up process.
- **disabled** – The EC2 Fast Launch feature is disabled. The state changes to `disabled` as soon as Amazon EC2 completes the clean up process.
- **disabling-failed** – Something went wrong that caused the clean up process to fail. This means that some pre-provisioned snapshots may still remain in the account.

stateTransitionReason

The reason that the state changed for the EC2 Fast Launch AMI.

> **Note**
>
> All fields in this event message are required.

The following example shows a newly enabled EC2 Fast Launch AMI that has launched the first instance to start the pre-provisioning process. At this point, the state is `enabling`. After Amazon EC2 creates the first pre-provisioned snapshot, the state changes to `enabled`.

```
{
 "version": "0",
 "id": "01234567-0123-0123-0123-012345678901",

}
```

Monitor EC2 Fast Launch metrics with CloudWatch

Amazon EC2 AMIs with EC2 Fast Launch enabled send metrics to Amazon CloudWatch. You can use the AWS Management Console, the AWS CLI, or an API to list the metrics that EC2 Fast Launch sends to CloudWatch. The `AWS/EC2` namespace includes the following EC2 Fast Launch metrics:

Metric	Description
NumberOfAvailableFastLaunchSnapshots	The number of pre-provisioned snapshots available per EC2 Fast Launch enabled AMI.
NumberOfInstancesFastLaunched	The number of instances per EC2 Fast Launch enabled AMI that were launched from pre-provisioned snapshots.
NumberOfInstancesNotFastLaunched	The number of instances per EC2 Fast Launch enabled AMI that resulted in a cold boot

Metric	Description
	due to the lack of available pre-provisioned snapshots at launch time.
FastLaunchSnapshotUsedToRefillStartTime	The timestamp when Amazon EC2 launched a new image from a EC2 Fast Launch enabled AMI to create another snapshot after an existing snapshot was used.
FastLaunchSnapshotCreationTime	Measures the time it took for Amazon EC2 to launch an instance and create a snapshot for a EC2 Fast Launch enabled AMI.

Service-linked role for EC2 Fast Launch

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information about how Amazon EC2 uses IAM roles, including service-linked roles, see IAM roles for Amazon EC2.

Amazon EC2 uses the service-linked role named AWSServiceRoleForEC2FastLaunch to create and manage a set of pre-provisioned snapshots that reduce the time it takes to launch instances from your Windows AMI.

Permissions granted by AWSServiceRoleForEC2FastLaunch

The AWSServiceRoleForEC2FastLaunch service-linked role trusts the following service to assume the role:

- `ec2fastlaunch.amazonaws.com`

Amazon EC2 uses the EC2FastLaunchServiceRolePolicy managed policy to complete the following actions:

- **AWS CloudFormation** – Allow EC2 Fast Launch to get a description of associated CloudFormation stacks.

- **Amazon CloudWatch** – Post metric data associated with EC2 Fast Launch to the Amazon EC2 namespace.
- **Amazon EC2** – Access is granted for EC2 Fast Launch to perform the following actions:
  - Launch instances from an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, to perform provisioning steps. Additionally specify resource pattern that allows `ec2:RunInstances` for an AMI that's associated with License Manager.
  - Stop and terminate an instance that was launched by EC2 Fast Launch after it creates the pre-provisioned snapshot.
  - Describe image and instance type resources used to launch instances from an Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled and create snapshots from them.
  - Describe launch template resources and launch instances from a launch template.
  - Describe instances, instance attributes and instance status, volumes and volume attributes.
  - Describe network interfaces.
  - Delete resources that EC2 Fast Launch created, including snapshots, launch templates, volumes and network interfaces.
  - Tag resources that EC2 Fast Launch creates to launch and pre-provision, Windows instances, and create snapshots for the final launch process to consume.
- **Amazon EventBridge** – Includes access to create EventBridge event rules and retrieve details about or delete rules that it created. EC2 Fast Launch may also get a list of target services that receive EC2 Fast Launch events that are forwarded based on event rules, and add target services to or remove them from event rules that it created.
- **IAM** – Allows EC2 Fast Launch to create the `EC2FastLaunchServiceRolePolicy` service-linked role, to get and use instance profiles whose name contains `ec2fastlaunch`, and to launch instances on your behalf using the instance profile from your launch template.
- **AWS KMS** – Includes access to create grants and list grants that were created by EC2 Fast Launch that can be retired. Also to describe or use keys for the purpose of encrypting or decrypting volumes attached to instances that EC2 Fast Launch creates, and to generate data keys that are not plaintext.

To view the permissions for this policy, see EC2FastLaunchServiceRolePolicy in the *AWS Managed Policy Reference*.

For more information about using managed policies for Amazon EC2, see AWS managed policies for Amazon EC2.

Create a service-linked role

You don't need to create this service-linked role manually. When you start using EC2 Fast Launch for your AMI, Amazon EC2 creates the service-linked role for you, if it doesn't already exist.

If the service-linked role is deleted from your account, you can enable EC2 Fast Launch for another Windows AMI to re-create the role in your account. Alternatively, you can disable EC2 Fast Launch for your current AMI, and then enable it again. However, disabling the feature results in your AMI using the standard launch process for all new instances while Amazon EC2 removes all of your pre-provisioned snapshots. After all of the pre-provisioned snapshots are gone, you can enable using EC2 Fast Launch for your AMI again.

Access to customer managed keys

To enable EC2 Fast Launch for an encrypted AMI that uses a customer managed key for encryption, you must grant the AWSServiceRoleForEC2FastLaunch role permission to use the CMK. To do this, call the create-grant command. For `--grantee-principal`, specify the ARN for the AWSServiceRoleForEC2FastLaunch role in your account. For `--operations`, specify `CreateGrant`.

```
aws kms create-grant \
    --key-id arn:aws:kms:eusc-de-
east-1:111122223333:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws:iam::111122223333:role/AWSServiceRoleForEC2FastLaunch \
    --operations CreateGrant
```

Edit a service-linked role

Amazon EC2 does not allow you to edit the AWSServiceRoleForEC2FastLaunch service-linked role. After you create a service-linked role, you can't change the name of the role, because various entities might reference the role. However, you can edit the description of the role by using IAM. For more information, see Editing a service-linked role in the *IAM User Guide*.

Delete a service-linked role

You can delete a service-linked role only after first deleting all of the related resources. This protects the Amazon EC2 resources that are associated with your Amazon EC2 Windows Server AMI with EC2 Fast Launch enabled, because you can't inadvertently remove permission to access the resources.

Use the IAM console, the AWS CLI, or the AWS API to delete the **AWSServiceRoleForEC2FastLaunch** service-linked role. For more information, see Delete a service-linked role in the *IAM User Guide*.

Supported Regions

Amazon EC2 supports the EC2 Fast Launch service-linked role in all of the Regions where the Amazon EC2 service is available.

Troubleshoot Windows EC2 Fast Launch

Troubleshooting scenarios

The following scenarios can help you diagnose and fix common issues that you might encounter when you try to enable EC2 Fast Launch.

Unable to stop instance for snapshot creation

Description

When you enable EC2 Fast Launch, the service launches a set of instances that are used to create the pre-provisioned snapshots. Each instance is given 30 minutes to complete the process. If any of the instances complete successfully, then the service sets the Fast Launch status for the AMI to `Enabled`. However, if an instance fails to complete the process in the allotted time, and none of the other instances have completed the process, the service terminates all of the instances and sets the Fast Launch status for the AMI to `enabling_failed` and the Fast Launch status reason to the following:

```
Unable to stop instance ID=i-1234567890abcdef0 for snapshot creation.
```

Cause

Most often, this is caused by trying to enable EC2 Fast Launch for a Windows AMI that was created from a running instance, or an AMI that doesn't meet all of the EC2 Fast Launch prerequisites.

Solution

Ensure that the AMI you use meets all EC2 Fast Launch prerequisites.

To configure EC2 Fast Launch for an AMI, you must create the AMI using **Sysprep** with the shutdown option. For more information, see Create an Amazon EC2 AMI using Windows Sysprep.

You've reached your VPC limit

Description

If you don't use a launch template to specify an existing VPC, and don't have a default VPC defined for your account, the service automatically creates an CloudFormation stack that includes a VPC and other resources, as described in EC2 Fast Launch prerequisites.

Cause

You've reached the maximum number of VPCs that are allowed in your AWS account for the Region, and you have not specified an existing VPC for EC2 Fast Launch to use. This causes the process to fail.

Solution

You can address this issue with either of the following options:

- You can request a quota increase
- You can provide a launch template that specifies an existing VPC

To request an increase to the number of VPCs that your account can define per Region, follow these steps:

1. Open the Service Quotas console at https://eusc-de-east-1.console.amazonaws-eusc.eu/servicequotas/.
2. In the **Service Console Dashboard**, choose **Amazon Virtual Private Cloud (Amazon VPC)**. This opens the VPC service quotas.
3. Filter on `VPCs per Region` to go directly to the quota.
4. Select **VPCs per Region**, and choose **Request increase at account level**.

If you have an urgent quota request, or if your quota increase request is denied, contact Support for assistance. For more information, see Requesting a quota increase in the *Service Quotas User Guide*.

Insufficient permissions to enable EC2 Fast Launch

Description

When you enable EC2 Fast Launch for the first time without specifying a Launch Template, EC2 Fast Launch creates a service-owned CloudFormation stack with service default resources. However, the CloudFormation templates will fail to deploy if your IAM principal (role or user) lacks the necessary permissions.

The log message might look something like the following:

```
Can't enable EC2 Fast Launch. The IAM credentials that you are using do not have
 sufficient permissions. Attach EC2FastLaunchFullAccess in the IAM console.
```

Cause

Your IAM user or role lacks the necessary permissions to enable EC2 Fast Launch.

Solution

Verify that your IAM principal (user or role) that enables EC2 Fast Launch has the `EC2FastLaunchFullAccess` policy attached. This AWS managed policy grants full access to all EC2 Fast Launch resources. To view the permissions for this policy, see the EC2FastLaunchFullAccess policy in the *AWS Managed Policy Reference*.

Change the Windows Administrator password for your Amazon EC2 instance

If you launch your instance from an AWS Windows AMI, the launch agents that are pre-installed set the default password as follows:

- For Windows Server 2022 and later, EC2Launch v2 generates the default password.
- For Windows Server 2016 and 2019, the EC2Launch agent generates the default password.
- For Windows Server 2012 R2 and earlier, the EC2Config service generates the default password.

> **Note**
>
> For Windows Server 2016 and later AMIs, `Password never expires` is disabled for the local administrator. For AMI versions prior to Windows Server 2016, `Password never expires` is enabled for the local administrator.

Change the Administrator password after connecting

When you connect to an instance the first time, we recommend that you change the Administrator password from its default value. Use the following procedure to change the Administrator password for a Windows instance.

> **Important**
>
> Store the new password in a safe place. You won't be able to retrieve the new password using the Amazon EC2 console. The console can only retrieve the default password. If you attempt to connect to the instance using the default password after changing it, you'll get a "Your credentials did not work" error.

To change the local Administrator password

1. Connect to the instance and open a command prompt.
2. Run the following command. If your new password includes special characters, enclose the password in double quotes.

```
net user Administrator "new_password"
```

3. Store the new password in a safe place.

Change a lost or expired password

If you lose your password or it expires, you can generate a new password. For password reset procedures, see Reset the Windows administrator password for an Amazon EC2 Windows instance.

Add optional Windows Server components to Amazon EC2 Windows instances

To access and install the optional components, you must find the correct EBS snapshot for your version of Windows Server, create a volume from the snapshot, and attach the volume to your instance.

Before you begin

Use the AWS Management Console or a command line tool to get the instance ID and Availability Zone of your instance. You must create your EBS volume in the same Availability Zone as your instance.

Use one of the following procedures to add Windows Server components to your instance.

Console

To add Windows components to your instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Snapshots**.
3. From the **Filter** bar, choose **Public snapshots**.
4. Add the **Owner Alias** filter and choose **amazon**.
5. Add the **Description** filter and enter **`Windows`**.
6. Press Enter
7. Select the snapshot that matches your system architecture and language preference. For example, select **Windows 2019 English Installation Media** if your instance is running Windows Server 2019.
8. Choose **Actions**, **Create volume from snapshot**.
9. For **Availability Zone**, select the Availability Zone that matches your Windows instance. Choose **Add tag** and enter **`Name`** for the tag key and a descriptive name for the tag value. Choose **Create volume**.
10. In the **Successfully created volume** message (green banner), choose the volume that you just created.
11. Choose **Actions**, **Attach volume**.
12. From **Instance**, select the instance ID.

13. For **Device name**, enter the name of the device for the attachment. If you need help with the device name, see Device names for volumes on Amazon EC2 instances.
14. Choose **Attach volume**.
15. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the *Amazon EBS User Guide*.

    > **Important**
    >
    > Do not initialize the volume.

16. Open **Control Panel**, **Programs and Features**. Choose **Turn Windows features on or off**. If you are prompted for installation media, specify the EBS volume with the installation media.
17. (Optional) When you are finished with the installation media, you can detach the volume. After you detach the volume, you can delete it.

AWS CLI

To add Windows components to your instance

1. Use the describe-snapshots command with the `owner-ids` parameter and `description` filter to get a list of the available installation media snapshots.

```
aws ec2 describe-snapshots \
    --owner-ids amazon \
    --filters Name=description,Values=Windows*
```

2. In the output, note the ID of the snapshot that matches your system architecture and language preference. For example:

```
{
    "Snapshots": [
    ...
        {
            "OwnerAlias": "amazon",
            "Description": "Windows 2019 English Installation Media",
            "Encrypted": false,
            "VolumeId": "vol-be5eafcb",
            "State": "completed",
```

```
            "VolumeSize": 6,
            "Progress": "100%",
            "StartTime": "2019-10-25T20:00:47.000Z",
            "SnapshotId": "snap-22da283e",
            "OwnerId": "123456789012"
        },
    ...
    ]
}
```

3. Use the create-volume command to create a volume from the snapshot. Specify the same Availability Zone as your instance.

```
aws ec2 create-volume \
    --snapshot-id snap-0abcdef1234567890 \
    --volume-type gp2 \
    --availability-zone us-east-1a
```

4. In the output, note the volume ID.

```
{
    "AvailabilityZone": "us-east-1a",
    "Encrypted": false,
    "VolumeType": "gp2",
    "VolumeId": "vol-01234567890abcdef",
    "State": "creating",
    "Iops": 100,
    "SnapshotId": "snap-0abcdef1234567890",
    "CreateTime": "2017-04-18T10:33:10.940Z",
    "Size": 6
}
```

5. Use the attach-volume command to attach the volume to your instance.

```
aws ec2 attach-volume \
    --volume-id vol-0c98b37f30bcbc290 \
    --instance-id i-01474ef662b89480 \
    --device xvdg
```

6. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the *Amazon EBS User Guide*.

> **Important**
>
> Do not initialize the volume.

7. Open **Control Panel**, **Programs and Features**. Choose **Turn Windows features on or off**. If you are prompted for installation media, specify the EBS volume with the installation media.
8. (Optional) When you are finished with the installation media, use the detach-volume command to detach the volume from your instance. After you detach the volume, you can use the delete-volume command to delete the volume.

PowerShell

To add Windows components to your instance

1. Use the Get-EC2Snapshot cmdlet with the `Owner` and `description` filters to get a list of the available installation media snapshots.

```
Get-EC2Snapshot `
    -Owner amazon `
    -Filter @{ Name="description"; Values="Windows*" }
```

2. In the output, note the ID of the snapshot that matches your system architecture and language preference. For example:

```
...
DataEncryptionKeyId :
Description         : Windows 2019 English Installation Media
Encrypted           : False
KmsKeyId            :
OwnerAlias          : amazon
OwnerId             : 123456789012
Progress            : 100%
SnapshotId          : snap-0abcdef1234567890
StartTime           : 10/25/2019 8:00:47 PM
State               : completed
StateMessage        :
Tags                : {}
VolumeId            : vol-01234567890abcdef
```

```
VolumeSize          : 6
...
```

3. Use the New-EC2Volume cmdlet to create a volume from the snapshot. Specify the same Availability Zone as your instance.

```
New-EC2Volume `
    -AvailabilityZone us-east-1a `
    -VolumeType gp2 `
    -SnapshotId snap-0abcdef1234567890
```

4. In the output, note the volume ID.

```
Attachments      : {}
AvailabilityZone : us-east-1a
CreateTime       : 4/18/2017 10:50:25 AM
Encrypted        : False
Iops             : 100
KmsKeyId         :
Size             : 6
SnapshotId       : snap-0abcdef1234567890
State            : creating
Tags             : {}
VolumeId         : vol-01234567890abcdef
VolumeType       : gp2
```

5. Use the Add-EC2Volume cmdlet to attach the volume to your instance.

```
Add-EC2Volume `
    -InstanceId i-1234567890abcdef0 `
    -VolumeId vol-01234567890abcdef `
    -Device xvdh
```

6. Connect to your instance and make the volume available. For more information, see Make an Amazon EBS volume available for use in the *Amazon EBS User Guide*.

> **Important**
>
> Do not initialize the volume.

7. Open **Control Panel**, **Programs and Features**. Choose **Turn Windows features on or off**. If you are prompted for installation media, specify the EBS volume with the installation media.
8. (Optional) When you are finished with the installation media, use the Dismount-EC2Volume cmdlet to detach the volume from your instance. After you detach the volume, you can use the Remove-EC2Volume cmdlet to delete the volume.

Install Windows Subsystem for Linux on your EC2 Windows instance

The Windows Subsystem for Linux (WSL) is a feature of Microsoft Windows. By installing WSL on your EC2 Windows instance, you can run native Linux tools directly on your Windows instance.

There are two versions of Windows Subsystem for Linux (WSL): WSL 1 and WSL 2. For more information, see Windows Subsystem for Linux Documentation on the Microsoft website.

Requirements

- The operating system must be Windows Server 2019 or later.
- You can only install WSL 1 on virtualized Windows instances (the instance size is not `.metal` or does not support nested virtualization).
- You can install either WSL 1 or WSL 2 on instances that support nested virtualization and have the `NestedVirtualization` CPU Option enabled.
- You can install either WSL 1 or WSL 2 on bare metal instances (the instance size is `.metal`). Bare metal instances provide the required support for nested virtualization by default.

For more information about nested virtualization for EC2, see Use nested virtualization to run hypervisors in Amazon EC2 instances.

Install WSL on your Windows instance

To install WSL 1

1. Install WSL. The process that you'll use depends on the version of Windows Server running on the instance.
   - **Windows Server 2022 and later** - Run the following standard installation command on your EC2 instance.

```
wsl --install --enable-wsl1 --no-launch
```

- **Windows Server 2019** - Enable WSL and then install WSL as described in Install WSL on previous versions of Windows Server on the Microsoft website.

2. Restart your EC2 instance.

```
shutdown -r -t 20
```

3. To configure WSL to use WSL 1, run the following command on your instance. This step is required for virtualized instances (the instance size is not `.metal` or not configured for nested virtualization).

```
wsl --set-default-version 1
```

4. Install the default distribution.

```
wsl --install
```

To install WSL 2 (.metal or instances with nested virtualization enabled)

Run the following standard installation command on your EC2 instance. By default, WSL 2 is installed.

```
wsl --install
```

EC2 Windows troubleshooting utilities

The `EC2WinUtil` driver provides the following types of troubleshooting support for your Windows instance.

Crash call stacks

`EC2WinUtil` collects basic crash information from your instance and writes it out to the serial console. The following list includes some of the key details that the utility writes to the console.

- Identification of the module that generated the fault.
- The Windows error code associated with the event.

- A stack trace of the most recent calls.

With these details, you can perform initial root cause analysis and determine if further analysis is needed. Output to the serial console also enables AWS to track crash trends for Amazon EC2 drivers, and diagnose large scale crash events.

> **Note**
>
> `EC2WinUtil` doesn't collect any customer data in its crash call stacks.

For driver release notes, see EC2 Windows Utility Driver version history

EC2 Windows Utility Driver version history

The following table shows which `EC2WinUtil` drivers run on each version of Windows Server on Amazon EC2. Earlier versions of the operating system use the driver that's preinstalled on AWS Windows Server AMIs that the instance launched from. AMIs that are shared with you or that you subscribe to through AWS Marketplace don't have the driver preinstalled.

Windows Server version	EC2WinUtil driver version
Windows Server 2025	latest version
Windows Server 2022	latest version
Windows Server 2019	latest version
Windows Server 2016	latest version

> **Note**
>
> Prior to driver version 3.0.0, the `EC2WinUtil` driver was not available to download for manual installation. Earlier versions were only available as preinstalled drivers for AWS Windows AMIs.

The following table describes the released versions of the `EC2WinUtil` driver.

Package version	Driver version	Details	Release date
2.0.0	2.0.0	Added support for output on MMIO serial ports for metal instance types. Also improved crash parsing and updated the output format.	August 23, 2018
1.0.1	1.0.1	Changed the driver name to `EC2WinUtil` due to a namespace conflict with Amazon Inspector. Several bug fixes are included.	March 1, 2018
1.0.0	1.0.0	Initial release. The driver was initially called `AwsAgent`.	November 28, 2017

Upgrade an EC2 Windows instance to a newer version of Windows Server

If it's time to upgrade the Windows Server operating system on your EC2 Windows instance from an earlier version, you can use one of the following methods.

In-place upgrade

An in-place upgrade operates on an existing instance. Only the operating system files are affected during this process, while your settings, server roles, and data are left intact.

Migration (also known as a side-by-side upgrade)

A migration involves capturing settings, configurations, and data, and porting these to a newer operating system on a fresh EC2 Windows instance. You can launch your instance from a public or private Windows AMI that you subscribe to from the AWS Marketplace, or an AMI that's shared with you. You can also create a custom AMI with EC2 Image Builder. See the Image Builder User Guide for more information.

> **Note**
>
> AWS provides a set of publicly available Amazon Machine Images (AMIs) for Windows Server versions that run on EC2 instances. These AMIs are updated on a monthly basis. For information about the latest Windows AMIs, see the AWS Windows AMI Reference.

Microsoft has traditionally recommended migrating to a newer version of Windows Server instead of upgrading in place. Migrating can result in fewer upgrade errors or issues, but can take longer than an in-place upgrade because of the need to provision a new instance, plan for and port applications, and adjust configuration settings on the new instance. An in-place upgrade can be faster, but software incompatibilities can produce errors.

Contents

- Perform an in-place upgrade on your EC2 Windows instance
- Use Automation runbooks to upgrade an EC2 Windows instance
- Migrate an EC2 Windows instance to a Nitro-based instance type
- Troubleshoot an operating system upgrade on an EC2 Windows instance

Perform an in-place upgrade on your EC2 Windows instance

Before you perform an in-place upgrade, you must determine which network drivers the instance is running. PV network drivers enable you to access your instance using Remote Desktop. Instances use either AWS PV, Intel Network Adapter, or the Enhanced Networking drivers. For more information, see Paravirtual drivers for Windows instances.

Before you begin an in-place upgrade

Complete the following tasks and note the following important details before you begin your in-place upgrade.

- Read the Microsoft documentation to understand the upgrade requirements, known issues, and restrictions. Also review the official instructions for upgrading.
  - Upgrade Options for Windows Server 2012
  - Upgrade Options for Windows Server 2012 R2
  - Upgrade and conversion options for Windows Server 2016 and above

  - Windows Server Upgrades
- We recommend performing an operating system upgrade on instances with at least 2 vCPUs and 4GB of RAM. If needed, you can change the instance to a larger size of the same type (t2.small to t2.large, for example), perform the upgrade, and then resize it back to the original size. If you are required to retain the instance size, you can monitor the progress using the instance console screenshot. For more information, see Amazon EC2 instance type changes.
- Verify that the root volume on your Windows instance has enough free disk space. The Windows Setup process might not warn you of insufficient disk space. For information about how much disk space is required to upgrade a specific operating system, see the Microsoft documentation. If the volume does not have enough space, it can be expanded. For more information, see Amazon EBS Elastic Volumes in the *Amazon EBS User Guide*.
- Determine your upgrade path. You must upgrade the operating system to the same architecture. For example, you must upgrade a 32-bit system to a 32-bit system. Windows Server 2008 R2 and later are 64-bit only.
- Disable antivirus and anti-spyware software and firewalls. These types of software can conflict with the upgrade process. Re-enable antivirus and anti-spyware software and firewalls after the upgrade completes.
- Update to the latest drivers as described in Migrate an EC2 Windows instance to a Nitro-based instance type.
- The Upgrade Helper Service only supports instances running Citrix PV drivers. If the instance is running Red Hat drivers, you must manually upgrade those drivers first.

Upgrade an instance in-place with AWS PV, Intel Network Adapter, or the Enhanced Networking drivers

Use the following procedure to upgrade a Windows Server instance using the AWS PV, Intel Network Adapter, or the Enhanced Networking network drivers.

To perform the in-place upgrade

1. Create an AMI of the system you plan to upgrade for either backup or testing purposes. You can then perform the upgrade on the copy to simulate a test environment. If the upgrade completes, you can switch traffic to this instance with little downtime. If the upgrade fails, you can revert to the backup. For more information, see Create an Amazon EBS-backed AMI.
2. Ensure that your Windows Server instance is using the latest network drivers.

a. To update your AWS PV driver, see Upgrade PV drivers on EC2 Windows instances.

b. To update your ENA driver, see Install the ENA driver on EC2 Windows instances.

c. To update your Intel drivers, see Enhanced networking with the Intel 82599 VF interface

3. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
4. In the navigation pane, choose **Instances**. Locate the instance. Make a note of the instance ID and Availability Zone for the instance. You need this information later in this procedure.
5. If you are upgrading from Windows Server 2012 or 2012 R2 to Windows Server 2016 or later, perform the following on your instance before you proceed.

   a. Uninstall the EC2Config service. For more information, see Windows Service administration for EC2Launch v2 and EC2Config agents.

   b. Install EC2Launch v1 or the EC2Launch v2 agent.

   c. Install the AWS Systems Manager SSM Agent. For more information, see Manually install SSM Agent on Amazon EC2 for Windows Server in the *AWS Systems Manager User Guide*.
6. Create a new volume from a Windows Server installation media snapshot.

   a. In the left navigation pane, under **Elastic Block Store**, choose **Snapshots**.

   b. From the filter bar, choose **Public snapshots**.

   c. In the search bar, specify the following filters:

      - Choose **Owner Alias**, then **=**, then **amazon**.
      - Choose **Description**, and then start typing **`Windows`**. Select the Windows filter that matches the system architecture and language preference you're upgrading to. For example, choose **Windows 2019 English Installation Media** to upgrade to Windows Server 2019.

   d. Select the checkbox next to the snapshot that matches the system architecture and language preference you're upgrading to, and then choose **Actions**, **Create volume from snapshot**.

   e. On the **Create volume** page, choose the Availability Zone that matches your Windows instance, and then choose **Create volume**.
7. In the **Successfully created volume vol-*`1234567890example`*** banner at the top of the page, choose the ID of the volume that you just created.
8. Choose **Actions**, **Attach volume**.

9. On the **Attach volume** page, for **Instance**, select the instance ID of your Windows instance, and then choose **Attach volume**.
10. Make the new volume available for use by following the steps at Make an Amazon EBS volume available for use.

> **Important**
>
> Do not initialize the disk because doing so will delete the existing data.

11. In Windows PowerShell, switch to the new volume drive. Begin the upgrade by opening the installation media volume you attached to the instance.

    a. If you are upgrading to Windows Server 2016 or later, run the following:

    ```
    .\setup.exe /auto upgrade /dynamicupdate disable
    ```

    > **Note**
    >
    > Running the setup.exe with the `/dynamicupdate` option set to disabled prevents Windows from installing updates during the Windows Server upgrade process, as installing updates during the upgrade can cause failures. You can install updates with Windows Update after the upgrade completes.

    If you are upgrading to an earlier version of Windows Server, run the following:

    ```
    Sources\setup.exe
    ```

    b. For **Select the operating system you want to install**, select the full installation option for your Windows Server instance, and choose **Next**.

    c. For **Which type of installation do you want?**, choose **Upgrade**.

    d. Complete the wizard.

Windows Server Setup copies and processes files. After several minutes, your Remote Desktop session closes. The time it takes to upgrade depends on the number of applications and server roles running on your Windows Server instance. The upgrade process could take as little as 40 minutes or several hours. The instance may fail one or more status checks during the upgrade

process. When the upgrade completes, all status checks pass. You can check the system log for console output or use Amazon CloudWatch metrics for disk and CPU activity to determine whether the upgrade is progressing.

> **Note**
>
> If upgrading to Windows Server 2019, after the upgrade is complete you can change the desktop background manually to remove the previous operating system name if desired.

If the instance has not passed all status checks after several hours, see Troubleshoot an operating system upgrade on an EC2 Windows instance.

Post upgrade tasks

1. Log in to the instance to initiate an upgrade for the .NET Framework and reboot the system when prompted.
2. If you haven't already done so in a prior step, install the EC2Launch v1 or EC2Launch v2 agent.
3. If you upgraded to Windows Server 2012 R2, we recommend that you upgrade the PV drivers to AWS PV drivers. If you upgraded on a Nitro-based instance, we recommend that you install or upgrade the NVME and ENA drivers. For more information, see NVMe drivers or Enable enhanced networking on Windows.
4. Re-enable antivirus and anti-spyware software and firewalls.

Use Automation runbooks to upgrade an EC2 Windows instance

You can perform an automated upgrade of your Windows and SQL Server instances on AWS with AWS Systems Manager Automation runbooks.

Contents

- Related services
- Execution options
- Upgrade Windows Server
- Upgrade SQL Server

Related services

The following AWS services are used in the automated upgrade process:

- **AWS Systems Manager**. AWS Systems Manager is a powerful, unified interface for centrally managing your AWS resources. For more information, see the *AWS Systems Manager User Guide*.
- AWS Systems Manager Agent (SSM Agent) is Amazon software that can be installed and configured on an Amazon EC2 instance, an on-premises server, or a virtual machine (VM). SSM Agent makes it possible for Systems Manager to update, manage, and configure these resources. The agent processes requests from the Systems Manager service in the AWS Cloud, and then runs them as specified in the request. For more information, see Working with SSM Agent in the *AWS Systems Manager User Guide*.
- **AWS Systems Manager SSM runbooks**. An SSM runbook defines the actions that Systems Manager performs on your managed instances. SSM runbooks use JavaScript Object Notation (JSON) or YAML, and they include steps and parameters that you specify. This topic uses two Systems Manager SSM runbooks for automation. For more information, see AWS Systems Manager Automation runbook reference in the *AWS Systems Manager User Guide*.

Execution options

When you select **Automation** on the Systems Manager console, select **Execute**. After you select an Automation document, you are then prompted to choose an automation execution option. You choose from the following options. In the steps for the paths provided later in this topic, we use the **Simple execution** option.

Simple execution

Choose this option if you want to update a single instance but do not want to go through each automation step to audit the results. This option is explained in further detail in the upgrade steps that follow.

Rate control

Choose this option if you want to apply the upgrade to more than one instance. You define the following settings.

- **Parameter**

This setting, which is also set in Multi-Account and Region settings, defines how your automation branches out.

- **Targets**

  Select the target to which you want to apply the automation. This setting is also set in Multi-Account and Region settings.

- **Parameter Values**

  Use the values defined in the automation document parameters.

- **Resource Group**

  In AWS, a resource is an entity you can work with. Examples include Amazon EC2 instances, AWS CloudFormation stacks, or Amazon S3 buckets. If you work with multiple resources, it might be useful to manage them as a group as opposed to moving from one AWS service to another for every task. In some cases, you may want to manage large numbers of related resources, such as EC2 instances that make up an application layer. In this case, you will likely need to perform bulk actions on these resources at one time.

- **Tags**

  Tags help you categorize your AWS resources in different ways, for example, by purpose, owner, or environment. This categorization is useful when you have many resources of the same type. You can quickly identify a specific resource using the assigned tags.

- **Rate Control**

  Rate Control is also set in Multi-Account and Region settings. When you set the rate control parameters, you define how many of your fleet to apply the automation to, either by target count or by percentage of the fleet.

Multi-Account and Region

In addition to the parameters specified under Rate Control that are also used in the Multi-Account and Region settings, there are two additional settings:

- **Accounts and organizational units (OUs)**

  Specify multiple accounts on which you want to run the automation.

- **AWS Regions**

Specify multiple AWS Regions where you want to run the automation.

Manual execution

This option is similar to **Simple execution**, but allows you to step through each automation step and audit the results.

Upgrade Windows Server

The `AWSEC2-CloneInstanceAndUpgradeWindows` runbook creates an Amazon Machine Image (AMI) from a Windows Server instance in your account and upgrades this AMI to a supported version of your choice. This multi-step process can take up to two hours to complete.

There are two AMIs included in the automated upgrade process:

- **Current running instance**. The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI**. This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

Prerequisites

To automate your Windows Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see Creating a role to delegate permissions to an AWS service in the *AWS Identity and Access Management User Guide*.

- Select the option for how you want the automation to be run. The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see Execution options.
- Verify that SSM Agent is installed on your instance. For more information see Installing and configuring SSM Agent on Amazon EC2 instances for Windows Server.
- Windows PowerShell 3.0 or later must be installed on your instance.
- For instances that are joined to a Microsoft Active Directory domain, we recommend specifying a `SubnetId` that does not have connectivity to your domain controllers to help avoid hostname conflicts.
- The instance subnet must have outbound connectivity to the internet, which provides access to AWS services such as Amazon S3 and access to download patches from Microsoft. This requirement is met if either the subnet is a public subnet and the instance has a public IP address, or if the subnet is a private subnet with a route that sends internet traffic to a public NAT device.
- This Automation works with instances running Windows Server 2008 R2, Windows Server 2012 R2, Windows Server 2016, and Windows Server 2019.
- Verify that the instance has 20 GB of free disk space in the boot disk.
- If the instance does not use a Windows license provided by AWS, then specify an Amazon EBS snapshot ID that includes Windows Server 2012 R2 installation media. To do this:
  1. Verify that the Amazon EC2 instance is running Windows Server 2012 or later.
  2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
  3. Open the context (right-click) menu for the ISO and mount it to an instance as, for example, drive E.
  4. Copy the content of the ISO from drive E:\ to drive D:\
  5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2 above.

Windows Server upgrade limitations

This automation doesn't support upgrading Windows domain controllers, clusters, or Windows desktop operating systems. In addition, this automation doesn't support Amazon EC2 instances for Windows Server with the following roles installed:

- Remote Desktop Session Host (RDSH)

- Remote Desktop Connection Broker (RDCB)
- Remote Desktop Virtualization Host (RDVH)
- Remote Desktop Web Access (RDWA)

Steps to perform an automated upgrade of Windows Server

Follow these steps to upgrade your Windows Server instance using the AWSEC2-CloneInstanceAndUpgradeWindows automation runbook.

1. Open Systems Manager from the **AWS Management Console**.
2. From the left navigation pane, under **Change Management**, choose **Automation**.
3. Choose **Execute automation**.
4. Search for the automation document called `AWSEC2-CloneInstanceAndUpgradeWindows`.
5. When the document name appears, select it. When you select it, the document details appear.
6. Choose **Execute automation** to input the parameters for this document. Leave **Simple execution** selected at the top of the page.
7. Enter the requested parameters based on the following guidance.

   - `InstanceID`

     Type: String

     (Required) The instance running Windows Server 2008 R2, 2012 R2, 2016, or 2019 with the SSM agent installed.

   - `InstanceProfile`.

     Type: String

     (Required) The IAM instance profile. This is the IAM role used to perform the Systems Manager automation against the Amazon EC2 instance and AWS AMIs. For more information, see Configure EC2 instance permissions in the *AWS Systems Manager User Guide*.

   - `TargetWindowsVersion`

     Type: String

     (Required) Select the target Windows version.

- `SubnetId`

  Type: String

  (Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (to download patches).

- `KeepPreUpgradedBackUp`

  Type: String

  (Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- `RebootInstanceBeforeTakingImage`

  Type: String

  (Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

8. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
9. When the automation completes, you will see the AMI ID. You can launch the AMI to verify that the Windows OS is upgraded.

> **Note**
>
> It is not necessary for the automation to run all of the steps. The steps are conditional based on the behavior of the automation and instance. Systems Manager might skip some steps that are not required.
> Additionally, some steps may time out. Systems Manager attempts to upgrade and install all of the latest patches. Sometimes, however, patches time out based on a definable timeout setting for the given step. When this happens, the Systems Manager automation continues to the next step to ensure that the internal OS is upgraded to the target Windows Server version.

10. After the automation completes, you can launch an Amazon EC2 instance using the AMI ID to review your upgrade. For more information about how to create an Amazon EC2 instance from an AWS AMI, see How do I launch an EC2 instance from a custom AMI?

Upgrade SQL Server

The AWSEC2-CloneInstanceAndUpgradeSQLServer script creates an AMI from an Amazon EC2 instance running SQL Server in your account, and then upgrades the AMI to a later version of SQL Server. This multi-step process can take up to two hours to complete.

In this workflow, the automation creates an AMI from the instance and then launches the new AMI in the subnet you provide. The automation then performs an in-place upgrade of SQL Server. After the upgrade is complete, the automation creates a new AMI before terminating the upgraded instance.

There are two AMIs included in the automated upgrade process:

- **Current running instance**. The first AMI is the current running instance, which is not upgraded. This AMI is used to launch another instance to run the in-place upgrade. When the process is complete, this AMI is deleted from your account, unless you specifically request to keep the original instance. This setting is handled by the parameter `KeepPreUpgradeImageBackUp` (default value is `false`, which means the AMI is deleted by default).
- **Upgraded AMI**. This AMI is the outcome of the automation process.

The final result is one AMI, which is the upgraded instance of the AMI.

When the upgrade is complete, you can test your application functionality by launching the new AMI in your Amazon VPC. After testing, and before you perform another upgrade, schedule application downtime before completely switching to the upgraded instance.

Prerequisites

To automate your SQL Server upgrade with the AWS Systems Manager Automation document, you must perform the following tasks:

- Create an IAM role with the specified IAM policies to allow Systems Manager to perform automation tasks on your Amazon EC2 instances and verify that you meet the prerequisites to use Systems Manager. For more information, see Creating a role to delegate permissions to an AWS service in the *AWS Identity and Access Management User Guide*.
- Select the option for how you want the automation to be run. The options for execution are **Simple execution**, **Rate control**, **Multi-account and Region**, and **Manual execution**. For more information about these options, see Execution options.

- The Amazon EC2 instance must use Windows Server 2008 R2 or later and SQL Server 2008 or later.
- Verify that SSM Agent is installed on your instance. For more information, see Working with SSM Agent on Amazon EC2 instances for Windows Server.
- Verify that the instance has enough free disk space:
  - If you are upgrading from Windows Server 2008 R2 to 2012 R2, or from Windows Server 2012 R2 to a later operating system, verify that you have 20 GB of free disk space in the instance boot disk.
  - If you are upgrading from Windows Server 2008 R2 to 2016 or later, verify that the instance has 40 GB of free disk space in the instance boot disk.
- For instances that use a Bring Your Own License (BYOL) SQL Server version, the following additional prerequisites apply:
  - Provide an Amazon EBS snapshot ID that includes the target SQL Server installation media. To do this:
    1. Verify that the Amazon EC2 instance is running Windows Server 2008 R2 or later.
    2. Create a 6 GB Amazon EBS volume in the same Availability Zone where the instance is running. Attach the volume to the instance. Mount it, for example, as drive D.
    3. Open the context (right-click) menu for the ISO and mount it to an instance as, for example, drive E.
    4. Copy the content of the ISO from drive E:\ to drive D:\
    5. Create an Amazon EBS snapshot of the 6 GB volume created in step 2.

SQL Server automated upgrade limitations

The following limitations apply when using the AWSEC2-CloneInstanceAndUpgradeSQLServer runbook to perform an automated upgrade:

- The upgrade can be performed on only a SQL Server using Windows authentication.
- Verify that no security patch updates are pending on the instances. Open **Control Panel**, then choose **Check for updates**.
- SQL Server deployments in HA and mirroring mode are not supported.

Steps to perform an automated upgrade of SQL Server

Follow these steps to upgrade your SQL Server using the AWSEC2-CloneInstanceAndUpgradeSQLServer automation runbook.

1. If you haven't already, download the SQL Server 2016 .iso file and mount it to the source server.
2. After the .iso file is mounted, copy all of the component files and place them on any volume of your choice.
3. Take an Amazon EBS snapshot of the volume and copy the snapshot ID onto a clipboard for later use. For more information, see Create Amazon EBS snapshots in the **Amazon EBS User Guide**.
4. Attach the instance profile to the Amazon EC2 source instance. This allows Systems Manager to communicate with the EC2 instance and run commands on it after it is added to the AWS Systems Manager service. For this example, we named the role `SSM-EC2-Profile-Role` with the `AmazonSSMManagedInstanceCore` policy attached to the role.
5. In the AWS Systems Manager console, in the left navigation pane, choose **Managed Instances**. Verify that your EC2 instance is in the list of managed instance. If you don't see your instance after a few minutes, see Where Are My Instances? in the *AWS Systems Manager User Guide*.
6. In the left navigation pane, under **Change Management** choose **Automation**.
7. Choose **Execute automation**.
8. Search for the automation document called `AWSEC2-CloneInstanceAndUpgradeSQLServer`.
9. Choose the `AWSEC2-CloneInstanceAndUpgradeSQLServer` SSM document, and then choose **Next**.
10. Ensure that the **Simple execution** option is selected.
11. Enter the requested parameters based on the following guidance.

    - `InstanceId`

      Type: String

      (Required) The instance running SQL Server 2008 R2 (or later).

    - `IamInstanceProfile`

      Type: String

(Required) The IAM instance profile.

- `SQLServerSnapshotId`

  Type: String

  (Required) The Snapshot ID for the target SQL Server installation media. This parameter is not required for SQL Server license-included instances.

- `SubnetId`

  Type: String

  (Required) This is the subnet for the upgrade process and where your source EC2 instance resides. Verify that the subnet has outbound connectivity to AWS services, including Amazon S3, and also to Microsoft (to download patches).

- `KeepPreUpgradedBackUp`

  Type: String

  (Optional) If this parameter is set to `true`, the automation retains the image created from the instance. The default setting is `false`.

- `RebootInstanceBeforeTakingImage`

  Type: String

  (Optional) The default is `false` (no reboot). If this parameter is set to `true`, Systems Manager reboots the instance before creating an AMI for the upgrade.

- `TargetSQLVersion`

  Type: String

  (Optional) The target SQL Server version. The default is `2016`.

12. After you have entered the parameters, choose **Execute**. When the automation begins, you can monitor the execution progress.
13. When **Execution status** shows **Success**, expand **Outputs** to view the AMI information. You can use the AMI ID to launch your SQL Server instance for the VPC of your choice.
14. Open the Amazon EC2 console. In the left navigation pane, choose **AMIs**. You should see the new AMI.

15. To verify that the new SQL Server version has been successfully installed, choose the new AMI and choose **Launch**.
16. Choose the type of instance that you want for the AMI, the VPC and subnet that you want to deploy to, and the storage that you want to use. Because you're launching the new instance from an AMI, the volumes are presented to you as an option to include within the new EC2 instance you are launching. You can remove any of these volumes, or you can add volumes.
17. Add a tag to help you identify your instance.
18. Add the security group or groups to the instance.
19. Choose **Launch Instance**.
20. Choose the tag name for the instance and select **Connect** under the **Actions** dropdown.
21. Verify that the new SQL Server version is the database engine on the new instance.

Migrate an EC2 Windows instance to a Nitro-based instance type

The AWS Windows AMIs are configured with the default settings used by the Microsoft installation media, with some customizations. The customizations include drivers and configurations that support Nitro-based instances, such as M5 and C5.

When migrating from Xen-based instances to Nitro-based instances, including bare metal instances, we recommend that you follow the steps in this topic in the following cases:

- If you are launching instances from custom Windows AMIs
- If you are launching instances from Windows AMIs provided by Amazon that were created before August 2018

Alternatively, you can use the `AWSSupport-UpgradeWindowsAWSDrivers` automation document to automate the procedures described in Part 1, Part 2, and Part 3. If you choose to use the automated procedure, see (Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager, and then continue with Part 4 and Part 5.

> **Note**
>
> The following migration procedures can be performed on Windows Server version 2016 and later. Earlier operating system versions that have reached end of life are not tested, and might not be compatible with the latest instance types.

To migrate Linux instances, see the section called “Instance type changes”.

Contents

- Part 1: Install and upgrade AWS PV drivers
- Part 2: Install and upgrade ENA
- Part 3: Upgrade AWS NVMe drivers
- Part 4: Update EC2Config and EC2Launch
- Part 5: Install the serial port driver for bare metal instances
- Part 6: Update power management settings
- Part 7: Update Intel chipset drivers for new instance types
- (Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

Before you begin

This procedure assumes that you have a Xen-based instance, such as an M4 or C4, and you are migrating to a Nitro-based instance.

You must use PowerShell version 3.0 or later to successfully perform the upgrade.

Note

When migrating, the static IP or custom DNS network settings on the existing network interface card may be lost as the instance will default to a new Enhanced Networking Adapter device.

Before following the steps in this procedure, we recommend that you create a backup of the instance. From the EC2 console, choose the instance that requires the migration, open the context (right-click) menu, and choose **Instance State**, **Stop**.

Warning

When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

Open the context (right-click) menu for the instance in the EC2 console, choose **Image**, and then choose **Create Image**.

> **Note**
>
> Parts 4 and 5 of these instructions can be completed after you migrate or change the instance type. However, we recommend that you complete them before you migrate, especially if you are migrating to a bare metal instance type.

Part 1: Install and upgrade AWS PV drivers

Though AWS PV drivers are not used in the Nitro system, you should still upgrade them if you are on previous versions of either Citrix PV or AWS PV. The latest AWS PV drivers resolve bugs in previous versions of the drivers that may appear while you are on a Nitro system, or if you need to migrate back to a Xen-based instance. As a best practice, we recommend always updating to the latest drivers for Windows instances on AWS.

Use the following procedure to perform an in-place upgrade of AWS PV drivers, or to upgrade from Citrix PV drivers to AWS PV drivers on Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016, or Windows Server 2019. For more information, see Upgrade PV drivers on EC2 Windows instances.

To upgrade a Domain Controller, see Upgrade a domain controller (AWS PV upgrade).

To perform an upgrade of or to AWS PV drivers

1. Connect to the instance using Remote Desktop and prepare the instance for upgrade. Take all non-system disks offline before you perform the upgrade. If you are performing an in-place update of AWS PV drivers, this step is not required. Set non-essential services to **Manual** start-up in the Services console.
2.
3. Extract the contents of the folder and run `AWSPVDriverSetup.msi`.

After running the MSI, the instance automatically reboots and upgrades the driver. The instance may not be available for up to 15 minutes.

After the upgrade is complete and the instance passes both health checks in the Amazon EC2 console, connect to the instance using Remote Desktop and verify that the new driver was

installed. In Device Manager, under **Storage Controllers**, locate **AWS PV Storage Host Adapter**. Verify that the driver version is the same as the latest version listed in the Driver Version History table. For more information, see AWS PV driver package history.

Part 2: Install and upgrade ENA

Upgrade to the latest Elastic Network Adapter driver to ensure that all network features are supported. If you launched your instance and it does not have enhanced networking already enabled, you must download and install the required network adapter driver on your instance. Then, set the enaSupport instance attribute to **activate enhanced networking**. You can only enable this attribute on supported instance types and only if the ENA driver is installed. For more information, see Enable enhanced networking with ENA on your EC2 instances.

1.
2. Extract the zip archive.
3. Install the driver by running the `install.ps1` PowerShell script from the extracted folder.

   > **Note**
   >
   > To avoid installation errors, run the `install.ps1` script as an administrator.

4. Check if your AMI has enaSupport activated. If not, continue by following the documentation at Enable enhanced networking with ENA on your EC2 instances.

Part 3: Upgrade AWS NVMe drivers

AWS NVMe drivers are used to interact with Amazon EBS and SSD instance store volumes that are exposed as NVMe block devices in the Nitro system for better performance.

> **Important**
>
> The following instructions are modified specifically for when you install or upgrade AWS NVMe on a Xen-based instance with the intention to migrate the instance to a Nitro-based instance.

1. If you need a previous version of the driver, see AWS NVMe Windows driver releases for supported versions.

2. Extract the zip archive.
3. Install the driver as described in `Readme.txt`.
4. Open a **PowerShell** session and run the following command:

```
PS C:\> start rundll32.exe sppnp.dll,Sysprep_Generalize_Pnp -wait
```

> **Note**
>
> To apply the command, you must run the PowerShell session as an administrator. PowerShell (x86) versions will result in an error.
> This command only runs sysprep on the device drivers. It does not run the full sysprep preparation.

5. For Windows Server 2008 R2 and Windows Server 2012, shut down the instance, change the instance type and start the instance, then proceed to Part 4. If you start the instance again on a Xen-based instance type before migrating to a Nitro-based instance type, it will not boot. For other supported Windows AMIs, you can change the instance type anytime after the device sysprep.

Part 4: Update EC2Config and EC2Launch

For Windows instances, the latest EC2Config and EC2Launch utilities provide additional functionality and information when running on the Nitro system, including on EC2 Bare Metal. By default, the EC2Config service is included in AMIs prior to Windows Server 2016. EC2Launch replaces EC2Config on Windows Server 2016 and later AMIs.

When the EC2Config and EC2Launch services are updated, new Windows AMIs from AWS include the latest version of the service. However, you must update your own Windows AMIs and instances with the latest version of EC2Config and EC2Launch.

To install or update EC2Config

1.
2. Run `EC2Install.exe`. For a complete list of options, run `EC2Install` with the `/?` option. By default, setup displays prompts. To run the command with no prompts, use the `/quiet` option.

For more information, see Install the latest version of EC2Config.

To install or update EC2Launch

1. If you have already installed and configured EC2Launch on an instance, make a backup of the EC2Launch configuration file. The installation process does not preserve changes in this file. By default, the file is located in the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.
2.
3. Download install.ps1 to the same directory where you downloaded `EC2-Windows-Launch.zip`.
4. Run `install.ps1`.

   > **Note**
   >
   > To avoid installation errors, run the `install.ps1` script as an administrator.

5. If you made a backup of the EC2Launch configuration file, copy it to the `C:\ProgramData\Amazon\EC2-Windows\Launch\Config` directory.

For more information, see Use the EC2Launch v1 agent to perform tasks during EC2 Windows instance launch.

Part 5: Install the serial port driver for bare metal instances

The `i3.metal` instance type uses a PCI-based serial device rather than an I/O port-based serial device. The latest Windows AMIs automatically use the PCI-based serial device and have the serial port driver installed. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.04.11 or later, you must install the Serial Port Driver to enable the serial device for EC2 features such as Password Generation and Console Output. The latest EC2Config and EC2Launch utilities also support i3.metal and provide additional functionality. Follow the steps in Part 4, if you have not yet done so.

To install the serial port driver

1.
2. Extract the contents of the folder, open the context (right-click) menu for `aws_ser.INF`, and choose **install**.

3. Choose **Okay**.

Part 6: Update power management settings

The following update to power management settings sets displays to never turn off, which allows for graceful OS shutdowns on the Nitro system. All Windows AMIs provided by Amazon as of 2018.11.28 already have this default configuration.

1. Open a command prompt or PowerShell session.
2. Run the following commands:

```
powercfg /setacvalueindex 381b4222-f694-41f0-9685-ff5bb260df2e 7516b95f-
f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
powercfg /setacvalueindex 8c5e7fda-e8bf-4a96-9a85-a6e23a8c635c 7516b95f-
f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
powercfg /setacvalueindex a1841308-3541-4fab-bc81-f71556f20b4a 7516b95f-
f776-4464-8c53-06167f40cc99 3c0bc021-c8a8-4e07-a973-6b14cbcb2b7e 0
```

Part 7: Update Intel chipset drivers for new instance types

The `u-6tb1.metal`, `u-9tb1.metal`, and `u-12tb1.metal` instance types use hardware that requires chipset drivers that were not previously installed on Windows AMIs. If you are not using an instance launched from an Amazon-provided Windows AMI dated 2018.11.19 or later, you must install the drivers using the Intel Chipset INF Utility.

To install the chipset drivers

1. Chipset INF Utility to the instance.
2. Extract the files.
3. Run `SetupChipset.exe`.
4. Accept the Intel software license agreement and install the chipset drivers.
5. Reboot the instance.

(Alternative) Upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

The `AWSSupport-UpgradeWindowsAWSDrivers` automation document automates the steps described in Part 1, Part 2, and Part 3. This method can also repair an instance where the driver upgrades have failed.

The `AWSSupport-UpgradeWindowsAWSDrivers` automation document upgrades or repairs storage and network AWS drivers on the specified EC2 instance. The document attempts to install the latest versions of AWS drivers online by calling the AWS Systems Manager Agent (SSM Agent). If SSM Agent is not contactable, the document can perform an offline installation of the AWS drivers if explicitly requested.

> **Note**
>
> This procedure will fail on a domain controller. To update drivers on a domain controller, see Upgrade a domain controller (AWS PV upgrade).

To automatically upgrade the AWS PV, ENA, and NVMe drivers using AWS Systems Manager

1. Open the Systems Manager console at https://eusc-de-east-1.console.amazonaws-eusc.eu/systems-manager.
2. Choose **Automation**, **Execute Automation**.
3. Search for and then select the **AWSSupport-UpgradeWindowsAWSDrivers** automation document, and then choose **Execute automation**.
4. In the **Input Parameters** section, configure the following options:

   Instance ID

   Enter the unique ID of the instance to upgrade.

   AllowOffline

   (Optional) Choose one of the following options:

   - `True` — Choose this option to perform an offline installation. The instance is stopped and restarted during the upgrade process.

> **Warning**
>
> When you stop an instance, the data on any instance store volumes is erased. To preserve data on instance store volumes, ensure that you back up the data to persistent storage.

- `False` — (Default) To perform an online installation, leave this option selected. The instance is restarted during the upgrade process.

> **Important**
>
> Online and offline upgrades create an AMI before attempting the upgrade operations. The AMI persists after the automation completes. Secure your access to the AMI, or delete it if it is no longer needed.

SubnetId

(Optional) Enter one of the following values:

- `SelectedInstanceSubnet` — (Default) The upgrade process launches the *helper* instance into the same subnet as the instance that is to be upgraded. The subnet must allow communication to the Systems Manager endpoints (`ssm.*`).
- `CreateNewVPC` — The upgrade process launches the *helper* instance into a new VPC. Use this option if you're not sure whether the target instance's subnet allows communication to the `ssm.*` endpoints. Your user must have permission to create a VPC.
- A specific subnet ID — Specify the ID of a specific subnet into which to launch the *helper* instance. The subnet must be in the same Availability Zone as the instance that is to be upgraded, and it must allow communication with the `ssm.*` endpoints.

5. Choose **Execute**.
6. Allow the upgrade to complete. It could take up to 10 minutes to complete an online upgrade, and up to 25 minutes to complete an offline upgrade.

Troubleshoot an operating system upgrade on an EC2 Windows instance

AWS provides upgrade support for issues or problems with the Upgrade Helper Service, an AWS utility that helps you perform in-place upgrades involving Citrix PV drivers.

After the upgrade, the instance might temporarily experience higher than average CPU utilization while the .NET Runtime Optimization service optimizes the .NET framework. This is expected behavior.

If the instance has not passed all status checks after several hours, check the following.

- If you upgraded to Windows Server 2008 and all status checks fail after several hours, the upgrade may have failed and be presenting a prompt to **Click OK** to confirm rolling back. Because the console is not accessible at this state, there is no way to click the button. To get around this, perform a reboot through the Amazon EC2 console or API. The reboot takes ten minutes or more to initiate. The instance might become available after 25 minutes.
- Remove applications or server roles from the server and try again.

If the instance does not pass all status checks after removing applications or server roles from the server, do the following.

- Stop the instance and attach the root volume to another instance. For more information, see the description of how to stop and attach the root volume to another instance in "Waiting for the metadata service".
- Analyze Windows Setup log files and event logs for failures.

For other issues or problems with an operating system upgrade or migration, we recommend reviewing the articles listed in Before you begin an in-place upgrade.

Tutorial: Connect an Amazon EC2 instance to an Amazon RDS database

Tutorial objective

The objective of this tutorial is to learn how to configure a secure connection between an Amazon EC2 instance and an Amazon RDS database by using the AWS Management Console.

There are different options for configuring the connection. In this tutorial, we explore the following three options:

- Option 1: Automatically connect an instance to an RDS database using the EC2 console

  Use the automatic connection feature in the EC2 console to automatically configure the connection between your EC2 instance and your RDS database to allow traffic between the EC2 instance and the RDS database.
- Option 2: Automatically connect an instance to an RDS database using the RDS console

  Use the automatic connection feature in the RDS console to automatically configure the connection between your EC2 instance and your RDS database to allow traffic between the EC2 instance and the RDS database.
- Option 3: Manually connect an instance to an RDS database by creating security groups

  Configure the connection between your EC2 instance to your RDS database by manually configuring and assigning the security groups to reproduce the configuration that is automatically created by the automatic connection feature in Option 1 and Option 2.

Context

As context for why you'd want to configure a connection between your EC2 instance and an RDS database, let's consider the following scenario: Your website presents a form to your users to fill in. You need to capture the form data in a database. You can host your website on an EC2 instance that's been configured as a web server, and you can capture the form data in an RDS database. The EC2 instance and the RDS database need to be connected to each other so that the form data can go from the EC2 instance to the RDS database. This tutorial explains how to configure that connection. Note that this is just one example of a use case for connecting an EC2 instance and an RDS database.

Architecture

The following diagram shows the resources that are created and the architectural configuration that results from completing all the steps in this tutorial.

The diagram illustrates the following resources that you'll create:

- You'll create an EC2 instance and an RDS database in the same AWS Region, VPC, and Availability Zone.
- You'll create the EC2 instance in a public subnet.
- You'll create the RDS database in a private subnet.

  When you use the RDS console to create the RDS database and automatically connect the EC2 instance, the VPC, DB subnet group, and public access settings for the database are automatically selected. The RDS database is automatically created in a private subnet within the same VPC as the EC2 instance.
- Internet users can connect to the EC2 instance by using SSH or HTTP/HTTPS through an Internet gateway.
- Internet users cannot connect directly to the RDS database; only the EC2 instance is connected to the RDS database.
- When you use the automatic connection feature to allow traffic between the EC2 instance and the RDS database, the following security groups are automatically created and added:
  - Security group **ec2-rds-*x*** is created and added to the EC2 instance. It has one outbound rule that references the **rds-ec2-*x*** security group as its destination. This allows traffic from the EC2 instance to reach the RDS database with the **rds-ec2-*x*** security group.
  - Security group **rds-ec2-*x*** is created and added to the RDS database. It has one inbound rule that references the **ec2-rds-*x*** security group as its source. This allows traffic from the EC2 instance with the **ec2-rds-*x*** security group to reach the RDS database.

By using separate security groups (one for the EC2 instance, and one for the RDS database), you have better control over the security of the instance and the database. If you were to use the same security group on both the instance and the database, and then modified the security group to suit, say, only the database, the modification would affect both the instance and the database. In other words, if you were to use one security group, you could unintentionally modify the security of a resource (either the instance or the database) because you'd forgotten that the security group was attached to it.

The security groups that are automatically created also respect least privilege as they only allow the mutual connection for this workload on the database port by creating a workload-specific security group pair.

Considerations

Consider the following when you complete the tasks in this tutorial:

- **Two consoles** – You will use the following two consoles for this tutorial:
  - Amazon EC2 console – You will use the EC2 console to launch instances, to automatically connect an EC2 instance to an RDS database, and for the manual option to configure the connection by creating the security groups.
  - Amazon RDS console – You will use the RDS console to create an RDS database and to automatically connect an EC2 instance to an RDS database.
- **One VPC** – To use the automatic connection feature, your EC2 instance and your RDS database must be in the same VPC.

  If you were to manually configure the connection between your EC2 instance and your RDS database, you could launch your EC2 instance in one VPC and your RDS database in another VPC; however, you'd need to set up additional routing and VPC configuration. This scenario is not covered in this tutorial.
- **One AWS Region** – The EC2 instance and RDS database must be located in the same Region.
- **Two security groups** – The connectivity between the EC2 instance and the RDS database is configured by two security groups—a security group for your EC2 instance, and a security group for your RDS database.

When you use the automatic connection feature in the EC2 console or RDS console to configure the connectivity (Option 1 and Option 2 of this tutorial), the security groups are automatically created and assigned to the EC2 instance and RDS database.

If you do not use the automatic connection feature, you'll need to manually create and assign the security groups. You do this in Option 3 of this tutorial.

Time to complete the tutorial

30 minutes

You can complete the entire tutorial in one sitting, or you can complete it one task at a time.

Costs

By completing this tutorial, you might incur costs for the AWS resources that you create.

If your EC2 instance and your RDS database are in different Availability Zones, you will incur data transfer fees. To avoid incurring these fees, the EC2 instance and the RDS database must be in the same Availability Zone. For information about data transfer fees, see Data Transfer on the Amazon EC2 On-Demand Pricing page.

To prevent incurring costs after you've completed the tutorial, make sure to delete the resources if they are no longer needed. For the steps to delete the resources, see Task 4 (*Optional*): Clean up.

Option 1: Automatically connect an instance to an RDS database using the EC2 console

The objective of Option 1 is to explore the automatic connection feature in the EC2 console that automatically configures the connection between your EC2 instance and RDS database to allow traffic from the EC2 instance to the RDS database. In Option 3, you'll learn how to manually configure the connection.

Tasks

- Before you begin
- Task 1 (Optional): Create an RDS database
- Task 2 (Optional): Launch an EC2 instance
- Task 3: Automatically connect your EC2 instance to your RDS database

- Task 4: Verify the connection configuration
- Task 5 (Optional): Clean up

Before you begin

You'll need the following to complete this tutorial:

- An RDS database that is in the same VPC as the EC2 instance. You can either use an existing RDS database or follow the steps in Task 1 to create a new RDS database.
- An EC2 instance that is in the same VPC as the RDS database. You can either use an existing EC2 instance or follow the steps in Task 2 to create a new EC2 instance.
- Permissions to call the following operations:
  - `ec2:AssociateRouteTable`
  - `ec2:AuthorizeSecurityGroupEgress`
  - `ec2:CreateRouteTable`
  - `ec2:CreateSecurityGroup`
  - `ec2:CreateSubnet`
  - `ec2:DescribeInstances`
  - `ec2:DescribeNetworkInterfaces`
  - `ec2:DescribeRouteTables`
  - `ec2:DescribeSecurityGroups`
  - `ec2:DescribeSubnets`
  - `ec2:ModifyNetworkInterfaceAttribute`
  - `ec2:RevokeSecurityGroupEgress`

Task 1 (*Optional*): Create an RDS database

> **Note**
>
> Creating a Amazon RDS database is not the focus of this tutorial. If you already have an RDS database and would like to use it in this tutorial, you can skip this task.
> If you use an existing RDS database, make sure that it is in the same VPC as your EC2 instance so that you can use the automatic connection feature.

The objective of this task is to create an RDS database so that you can complete Task 3 where you configure the connection between your EC2 instance and your RDS database. The steps in this task configure the RDS database as follows:

- Engine type: MySQL
- Template: Free tier
- DB instance identifier: **`tutorial-database-1`**
- DB instance class: `db.t3.micro`

> **Important**
>
> In a production environment, you should configure your database to meet your specific needs.

To create a MySQL RDS database

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. From the Region selector (at top right), choose an AWS Region. The database and the EC2 instance must be in the same Region to use the automatic connection feature in the EC2 console.
3. On the dashboard, choose **Create database**.
4. Under **Choose a database creation method**, check that **Standard create** is selected. If you choose **Easy create**, the VPC selector is not available. You must ensure that your database is in the same VPC as your EC2 instance to use the automatic connection feature in the EC2 console.
5. Under **Engine options**, for **Engine type**, choose **MySQL**.
6. Under **Templates**, choose a sample template to meet your needs. For this tutorial, choose **Free tier** to create an RDS database at no cost. However, note that the Free Tier is only available for accounts that qualify for the Free Tier. You can read more by choosing the **Info** link in the **Free tier** box.
7. Under **Settings**, do the following:

    a. For **DB instance identifier**, enter a name for the database. For this tutorial, enter **`tutorial-database-1`**.

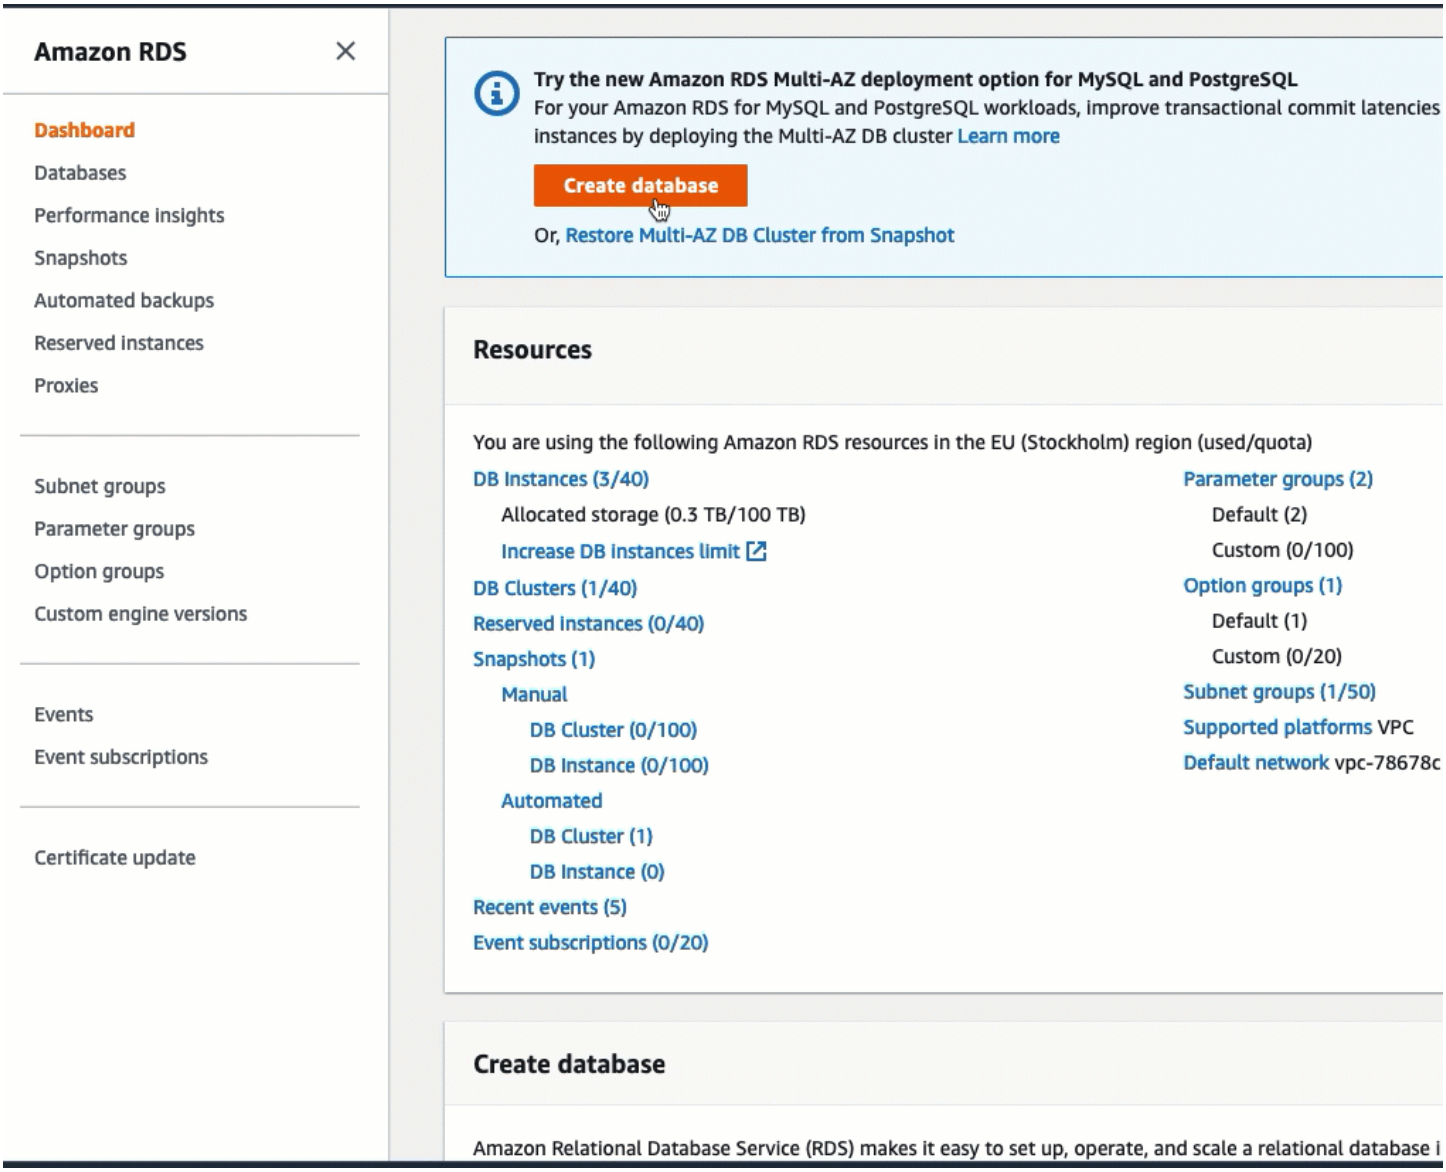
   b. For **Master username**, leave the default name, which is **`admin`**.

   c. For **Master password**, enter a password that you can remember for this tutorial, and then, for **Confirm password**, enter the password again.

8. Under **Instance configuration**, for **DB instance class**, leave the default, which is **db.t3.micro**.

9. Under **Connectivity**, for **Compute resource**, choose **Don't connect to an EC2 compute resource** because you'll connect the EC2 instance and the RDS database later in Task 3.

   (Later, in Option 2 of this tutorial, you'll try out the automatic connection feature in the RDS console by choosing **Connect to an EC2 compute resource**.)



10. For **Virtual private cloud (VPC)**, choose a VPC. The VPC must have a DB subnet group. To use the automatic connection feature, your EC2 instance and RDS database must be in the same VPC.

11. Keep all the default values for the other fields on this page.

12. Choose **Create database**.

    On the **Databases** screen, the **Status** of the new database is **Creating** until the database is ready to use. When the status changes to **Available**, you can connect to the database. Depending on the database class and the amount of storage, it can take up to 20 minutes before the new database is available.

View an animation: Create an RDS database

Task 2 (*Optional*): Launch an EC2 instance

> **Note**
>
> Launching an instance is not the focus of this tutorial. If you already have an Amazon EC2 instance and would like to use it in this tutorial, you can skip this task.
> If you use an existing EC2 instance, make sure that it is in the same VPC as your RDS database so that you can use the automatic connection feature.

The objective of this task is to launch an EC2 instance so that you can complete Task 3 where you configure the connection between your EC2 instance and your Amazon RDS database. The steps in this task configure the EC2 instance as follows:

- Instance name: **`tutorial-instance-1`**
- AMI: Amazon Linux 2
- Instance type: `t2.micro`
- Auto-assign public IP: Enabled
- Security group with the following three rules:
  - Allow SSH from your IP address
  - Allow HTTPS traffic from anywhere
  - Allow HTTP traffic from anywhere

> **Important**
>
> In a production environment, you should configure your instance to meet your specific needs.

To launch an EC2 instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. From the Region selector (at top right), choose an AWS Region. The instance and the RDS database must be in the same Region to use the automatic connection feature in the EC2 console.
3. On the **EC2 Dashboard**, choose **Launch instance**.
4. Under **Name and tags**, for **Name**, enter a name to identify your instance. For this tutorial, name the instance **`tutorial-instance-1`**. While the instance name is not mandatory, when you select your instance in the EC2 console, the name will help you easily identify it.
5. Under **Application and OS Images**, choose an AMI that meets your web server needs. This tutorial uses **Amazon Linux 2**.
6. Under **Instance type**, for **Instance type**, select an instance type that meets your web server needs. This tutorial uses `t2.micro`.
7. Under **Key pair (login)**, for **Key pair name**, choose your key pair.

8. Under **Network settings**, do the following:

   a. For **Network** and **Subnet**, if you haven't made changes to your default VPC or subnets, you can keep the default settings.

      If you have made changes to your default VPC or subnets, check the following:

      i. The instance must be in the same VPC as the RDS database to use the automatic connection feature. By default you have only one VPC.

      ii. The VPC that you're launching your instance into must have an internet gateway attached to it so that you can access your web server from the internet. Your default VPC is automatically set up with an internet gateway.

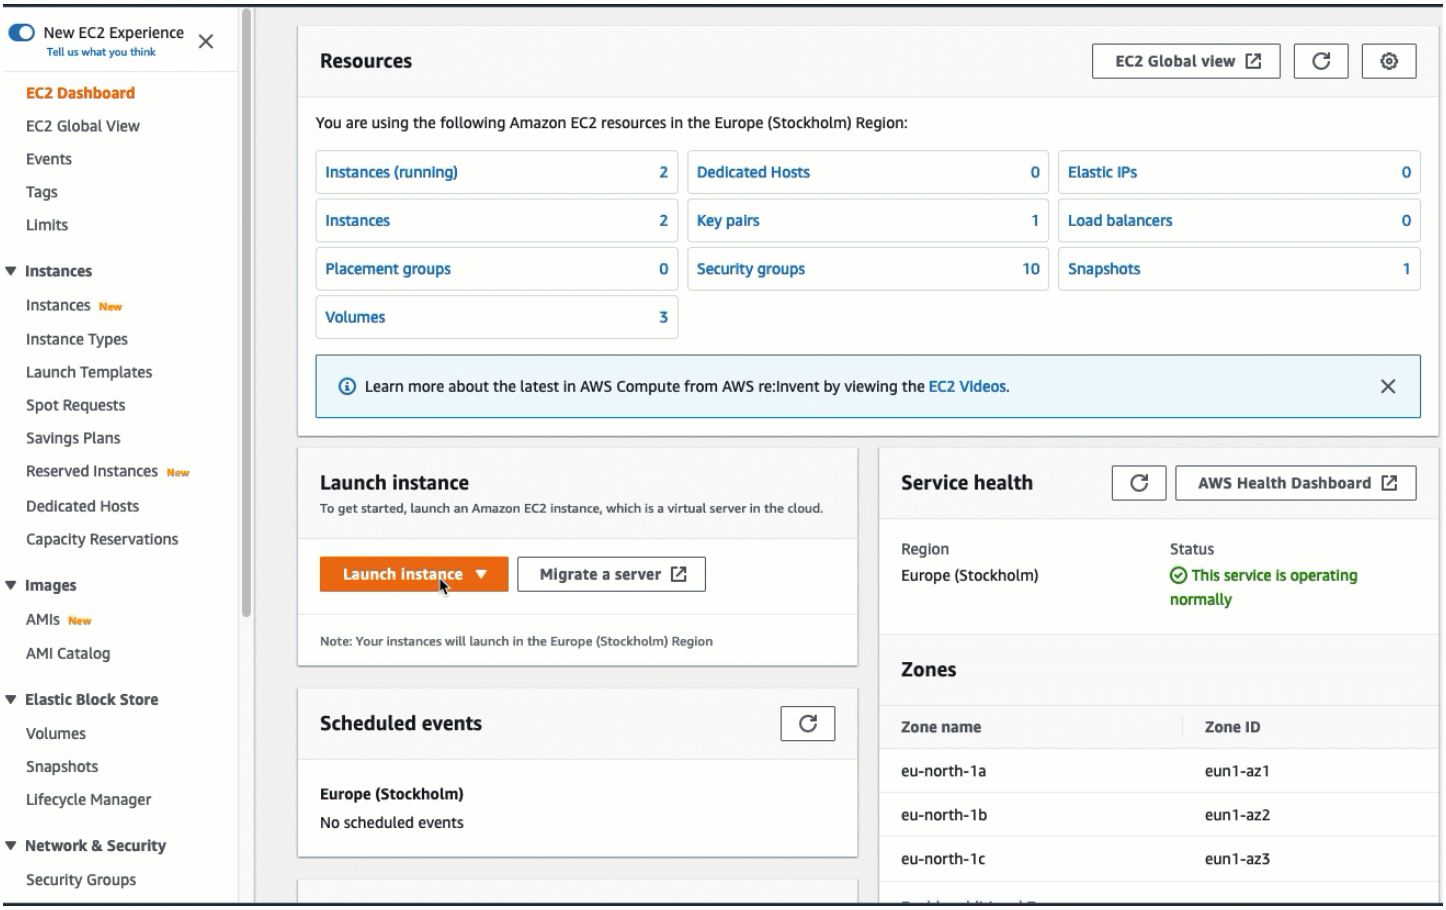
      iii. To ensure that your instance receives a public IP address, for **Auto-assign public IP**, check that **Enable** is selected. If **Disable** is selected, choose **Edit** (to the right of **Network Settings**), and then, for **Auto-assign public IP**, choose **Enable**.

   b. To connect to your instance by using SSH, you need a security group rule that authorizes SSH (Linux) or RDP (Windows) traffic from your computer's public IPv4 address. By default, when you launch an instance, a new security group is created with a rule that allows inbound SSH traffic from anywhere.

      To make sure that only your IP address can connect to your instance, under **Firewall (security groups)**, from the drop-down list next to the **Allow SSH traffic from** checkbox, choose **My IP**.

   c. To allow traffic from the internet to your instance, select the following checkboxes:

      - **Allow HTTPs traffic from the internet**
      - **Allow HTTP traffic from the internet**



9. In the **Summary** panel, review your instance configuration and then choose **Launch instance**.

10. Keep the confirmation page open. You'll need it for the next task when you automatically connect your instance to your database.

    If the instance fails to launch or the state immediately goes to `terminated` instead of `running`, see Troubleshoot Amazon EC2 instance launch issues.

For more information about launching an instance, see Launch an EC2 instance using the launch instance wizard in the console.

View an animation: Launch an EC2 instance

Task 3: Automatically connect your EC2 instance to your RDS database

The objective of this task is to use the automatic connection feature in the EC2 console to automatically configure the connection between your EC2 instance and your RDS database.

To automatically connect an EC2 instance to an RDS database using the EC2 console

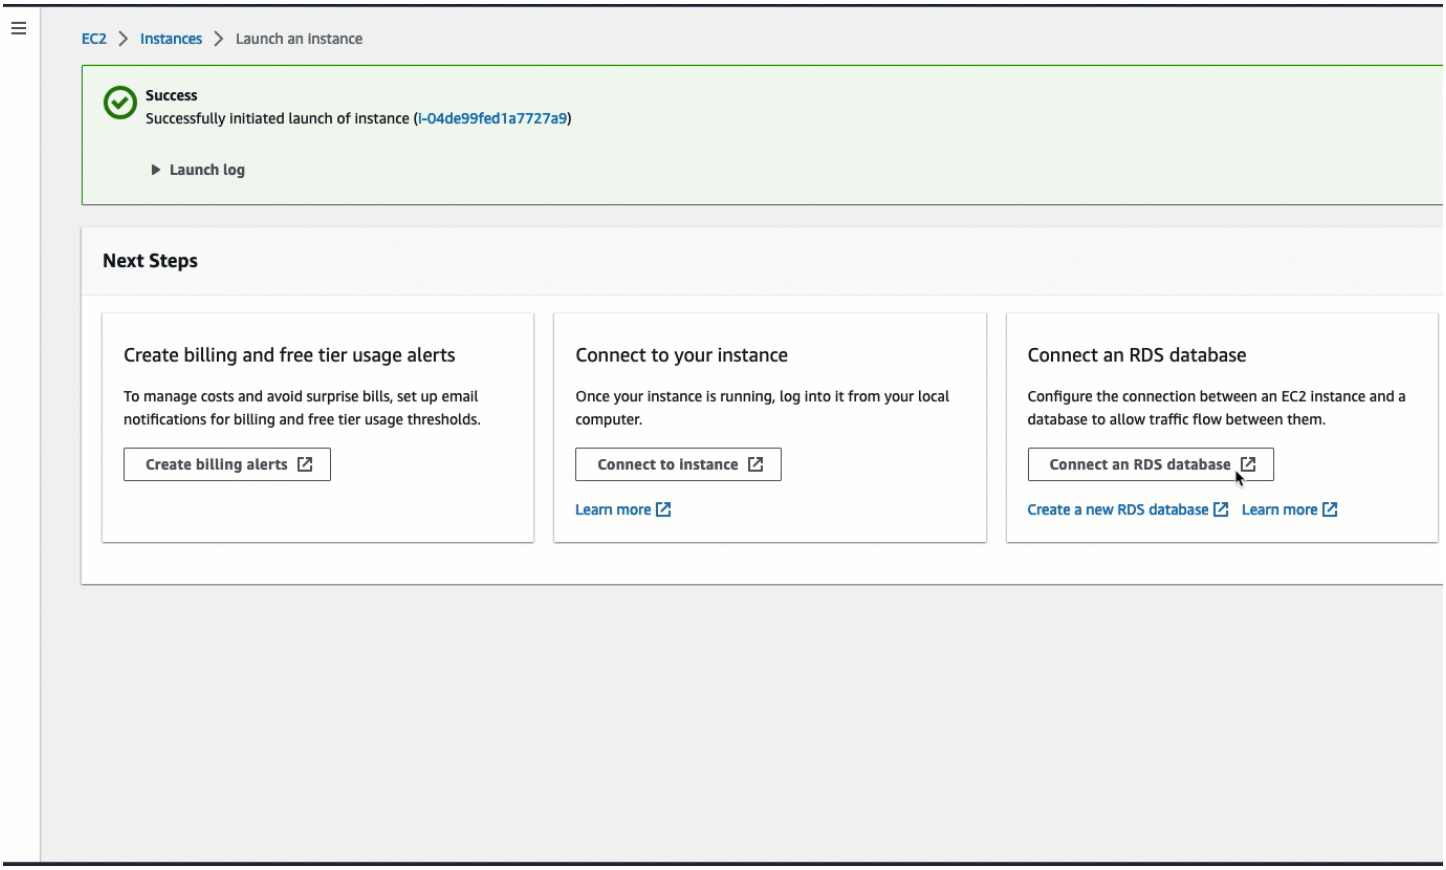
1. On the instance launch confirmation page (it should be open from the previous task), choose **Connect an RDS database**.

   If you closed the confirmation page, follow these steps:

   a. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

   b. In the navigation pane, choose **Instances**.

   c. Select the EC2 instance that you just created, and then choose **Actions**, **Networking**, **Connect RDS database**.



If **Connect RDS database** is not available, check that the EC2 instance is in the **Running** state.

2. For **Database role**, choose **Instance**. *Instance* in this case refers to the database instance.
3. For **RDS database**, choose the RDS database that you created in Task 1.

> **Note**
>
> The EC2 instance and the RDS database must be in the same VPC to connect to each other.

4. Choose **Connect**.

View an animation: Automatically connect a newly-launched EC2 instance to an RDS database

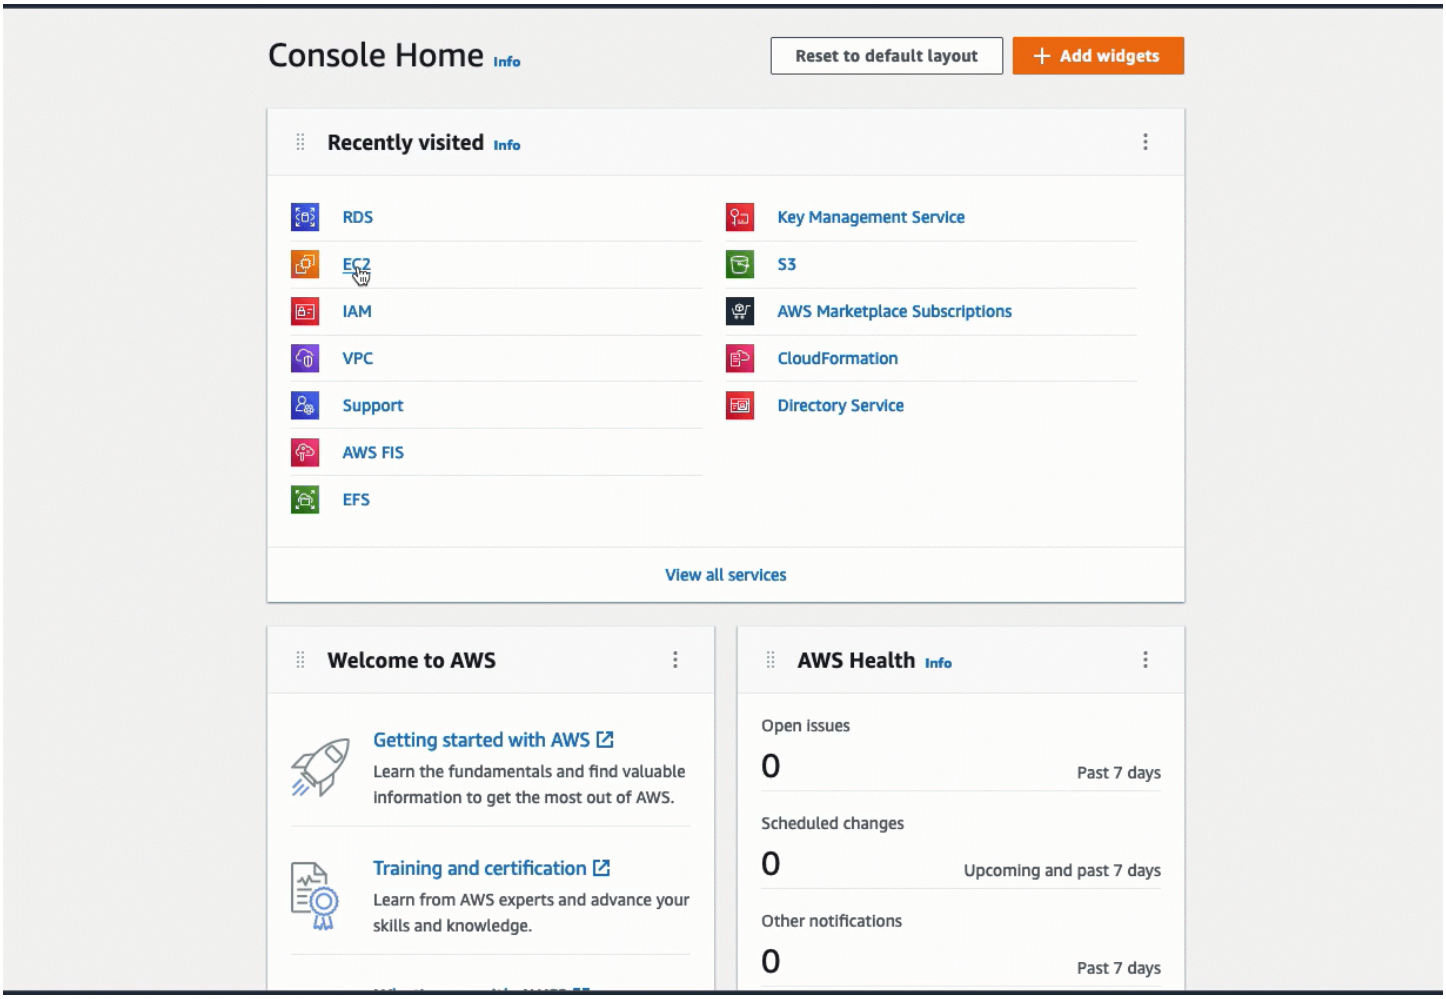
Task 4: Verify the connection configuration

The objective of this task is to verify that the two security groups were created and assigned to the instance and database.

When you use the automatic connection feature in the console to configure the connectivity, the security groups are automatically created and assigned to the instance and database, as follows:

- Security group **rds-ec2-*x*** is created and added to the RDS database. It has one inbound rule that references the **ec2-rds-*x*** security group as its source. This allows traffic from the EC2 instance with the **ec2-rds-*x*** security group to reach the RDS database.
- Security group **ec2-rds-*x*** is created and added to the EC2 instance. It has one outbound rule that references the **rds-ec2-*x*** security group as its destination. This allows traffic from the EC2 instance to reach the RDS database with the **rds-ec2-*x*** security group.

To verify the connection configuration using the console



1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. In the navigation page, choose **Databases**.
3. Choose the RDS database that you created for this tutorial.
4. On the **Connectivity & security** tab, under **Security**, **VPC security groups**, verify that a security group called **rds-ec2-*x*** is displayed.
5. Choose the **rds-ec2-*x*** security group. The **Security Groups** screen in the EC2 console opens.
6. Choose the **rds-ec2-*x*** security group to open it.
7. Choose the **Inbound rules** tab.
8. Verify that the following security group rule exists, as follows:
   - Type: **MYSQL/Aurora**
   - Port range: **3306**
   - Source: ***sg-0987654321example*** **/ ec2-rds-*x*** – This is the security group that is assigned to the EC2 instance that you verified in the preceding steps.
   - Description: **Rule to allow connections from EC2 instances with *sg-1234567890example* attached**
9. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
10. In the navigation pane, choose **Instances**.
11. Choose the EC2 instance that you selected to connect to the RDS database in the previous task, and choose the **Security** tab.
12. Under **Security details**, **Security groups**, verify that a security group called **ec2-rds-*x*** is in the list. *x* is a number.

13. Choose the **ec2-rds-*x*** security group to open it.
14. Choose the **Outbound rules** tab.
15. Verify that the following security group rule exists, as follows:

    - Type: **MYSQL/Aurora**
    - Port range: **3306**
    - Destination: ***sg-1234567890example*** **/ rds-ec2-*x***
    - Description: **Rule to allow connections to `database-tutorial` from any instances this security group is attached to**

By verifying that these security groups and security group rules exist and that they are assigned to the RDS database and EC2 instance as described in this procedure, you can verify that the connection was automatically configured by using the automatic connection feature.

View an animation: Verify the connection configuration

You have completed Option 1 of this tutorial. You can now either complete Option 2, which teaches you how to use the RDS console to automatically connect an EC2 instance to an RDS database, or you can complete Option 3, which teaches you how to manually configure the security groups that were automatically created in Option 1.

Task 5 (*Optional*): Clean up

> **Warning**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

Now that you have completed the tutorial, it is good practice to clean up (delete) any resources you no longer want to use. Cleaning up AWS resources prevents your account from incurring any further charges.

If you launched an EC2 instance specifically for this tutorial, you can terminate it to stop incurring any charges associated with it.

To terminate an instance using the console

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that you created for this tutorial, and choose **Instance state**, **Terminate instance**.
4. Choose **Terminate** when prompted for confirmation.

If you created an RDS database specifically for this tutorial, you can delete it to stop incurring any charges associated with it.

To delete an RDS database using the console

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. In the navigation pane, choose **Databases**.
3. Select the RDS database that you created for this tutorial, and choose **Actions**, **Delete**.
4. Enter **`delete me`** in the box, and then choose **Delete**.

Option 2: Automatically connect an instance to an RDS database using the RDS console

The objective of Option 2 is to explore the automatic connect feature in the RDS console that automatically configures the connection between your EC2 instance and RDS database to allow traffic from the EC2 instance to the RDS database. In Option 3, you'll learn how to manually configure the connection.

Tasks

- Before you begin
- Task 1 (Optional): Launch an EC2 instance
- Task 2: Create an RDS database and automatically connect it to your EC2 instance
- Task 3: Verify the connection configuration
- Task 4 (Optional): Clean up

Before you begin

You'll need the following to complete this tutorial:

- An EC2 instance that is in the same VPC as the RDS database. You can either use an existing EC2 instance or follow the steps in Task 1 to create a new instance.
- Permissions to call the following operations:
  - `ec2:AssociateRouteTable`
  - `ec2:AuthorizeSecurityGroupEgress`
  - `ec2:CreateRouteTable`
  - `ec2:CreateSecurityGroup`
  - `ec2:CreateSubnet`

- `ec2:DescribeInstances`
- `ec2:DescribeNetworkInterfaces`
- `ec2:DescribeRouteTables`
- `ec2:DescribeSecurityGroups`
- `ec2:DescribeSubnets`
- `ec2:ModifyNetworkInterfaceAttribute`
- `ec2:RevokeSecurityGroupEgress`

Task 1 (*Optional*): Launch an EC2 instance

> **Note**
>
> Launching an instance is not the focus of this tutorial. If you already have an Amazon EC2 instance and would like to use it in this tutorial, you can skip this task.

The objective of this task is to launch an EC2 instance so that you can complete Task 2 where you configure the connection between your EC2 instance and your Amazon RDS database. The steps in this task configure the EC2 instance as follows:

- Instance name: **`tutorial-instance-2`**
- AMI: Amazon Linux 2
- Instance type: `t2.micro`
- Auto-assign public IP: Enabled
- Security group with the following three rules:
  - Allow SSH from your IP address
  - Allow HTTPS traffic from anywhere
  - Allow HTTP traffic from anywhere

> **Important**
>
> In a production environment, you should configure your instance to meet your specific needs.

To launch an EC2 instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. On the **EC2 Dashboard**, choose **Launch instance**.
3. Under **Name and tags**, for **Name**, enter a name to identify your instance. For this tutorial, name the instance **`tutorial-instance-2`**. While the instance name is not mandatory, when you select your instance in the RDS console, the name will help you easily identify it.
4. Under **Application and OS Images**, choose an AMI that meets your web server needs. This tutorial uses **Amazon Linux**.
5. Under **Instance type**, for **Instance type**, select an instance type that meets your web server needs. This tutorial uses `t2.micro`.
6. Under **Key pair (login)**, for **Key pair name**, choose your key pair.
7. Under **Network settings**, do the following:

    a. For **Network** and **Subnet**, if you haven't made changes to your default VPC or subnets, you can keep the default settings.

    If you have made changes to your default VPC or subnets, check the following:

    i. The instance must be in the same VPC as the RDS database to use the automatic connection configuration. By default you have only one VPC.

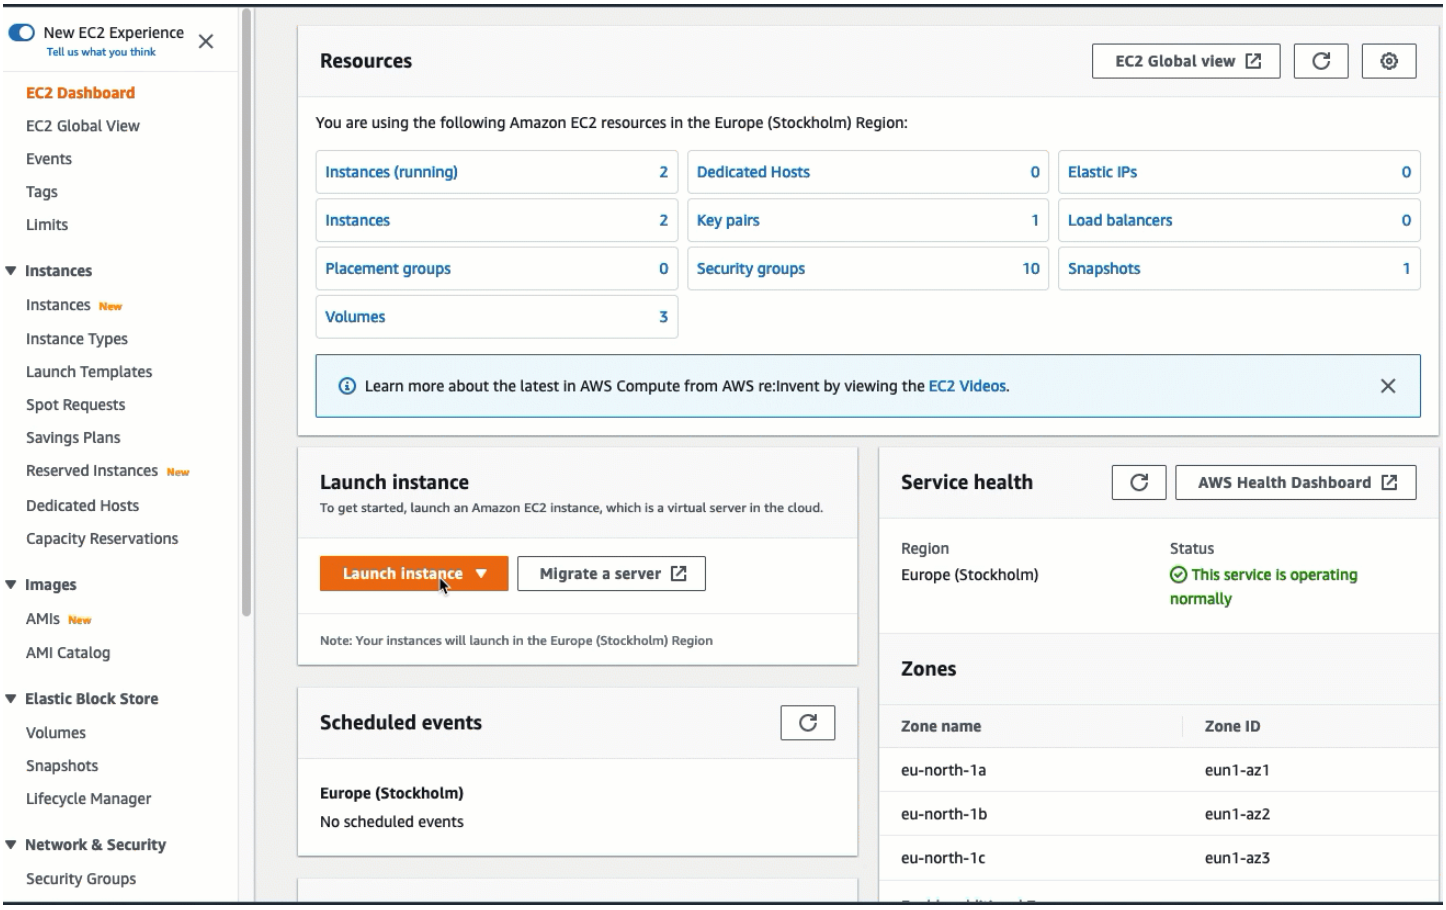
    ii. The VPC that you're launching your instance into must have an internet gateway attached to it so that you can access your web server from the internet. Your default VPC is automatically set up with an internet gateway.

    iii. To ensure that your instance receives a public IP address, for **Auto-assign public IP**, check that **Enable** is selected. If **Disable** is selected, choose **Edit** (to the right of **Network Settings**), and then, for **Auto-assign public IP**, choose **Enable**.

    b. To connect to your instance by using SSH, you need a security group rule that authorizes SSH (Linux) or RDP (Windows) traffic from your computer's public IPv4 address. By default, when you launch an instance, a new security group is created with a rule that allows inbound SSH traffic from anywhere.

    To make sure that only your IP address can connect to your instance, under **Firewall (security groups)**, from the drop-down list next to the **Allow SSH traffic from** checkbox, choose **My IP**.

    c. To allow traffic from the internet to your instance, select the following checkboxes:



- **Allow HTTPs traffic from the internet**
- **Allow HTTP traffic from the internet**

8. In the **Summary** panel, review your instance configuration and then choose **Launch instance**.
9. Choose **View all instances** to close the confirmation page and return to the console. Your instance will first be in a `pending` state, and will then go into the `running` state.

   If the instance fails to launch or the state immediately goes to `terminated` instead of `running`, see Troubleshoot Amazon EC2 instance launch issues.

For more information about launching an instance, see Launch an EC2 instance using the launch instance wizard in the console.

View an animation: Launch an EC2 instance

Task 2: Create an RDS database and automatically connect it to your EC2 instance

The objective of this task is to create an RDS database and use the automatic connection feature in the RDS console to automatically configure the connection between your EC2 instance and your RDS database. The steps in this task configure the DB instance as follows:

- Engine type: MySQL
- Template: Free tier
- DB instance identifier: **`tutorial-database`**
- DB instance class: `db.t3.micro`

> **Important**
>
> In a production environment, you should configure your instance to meet your specific needs.

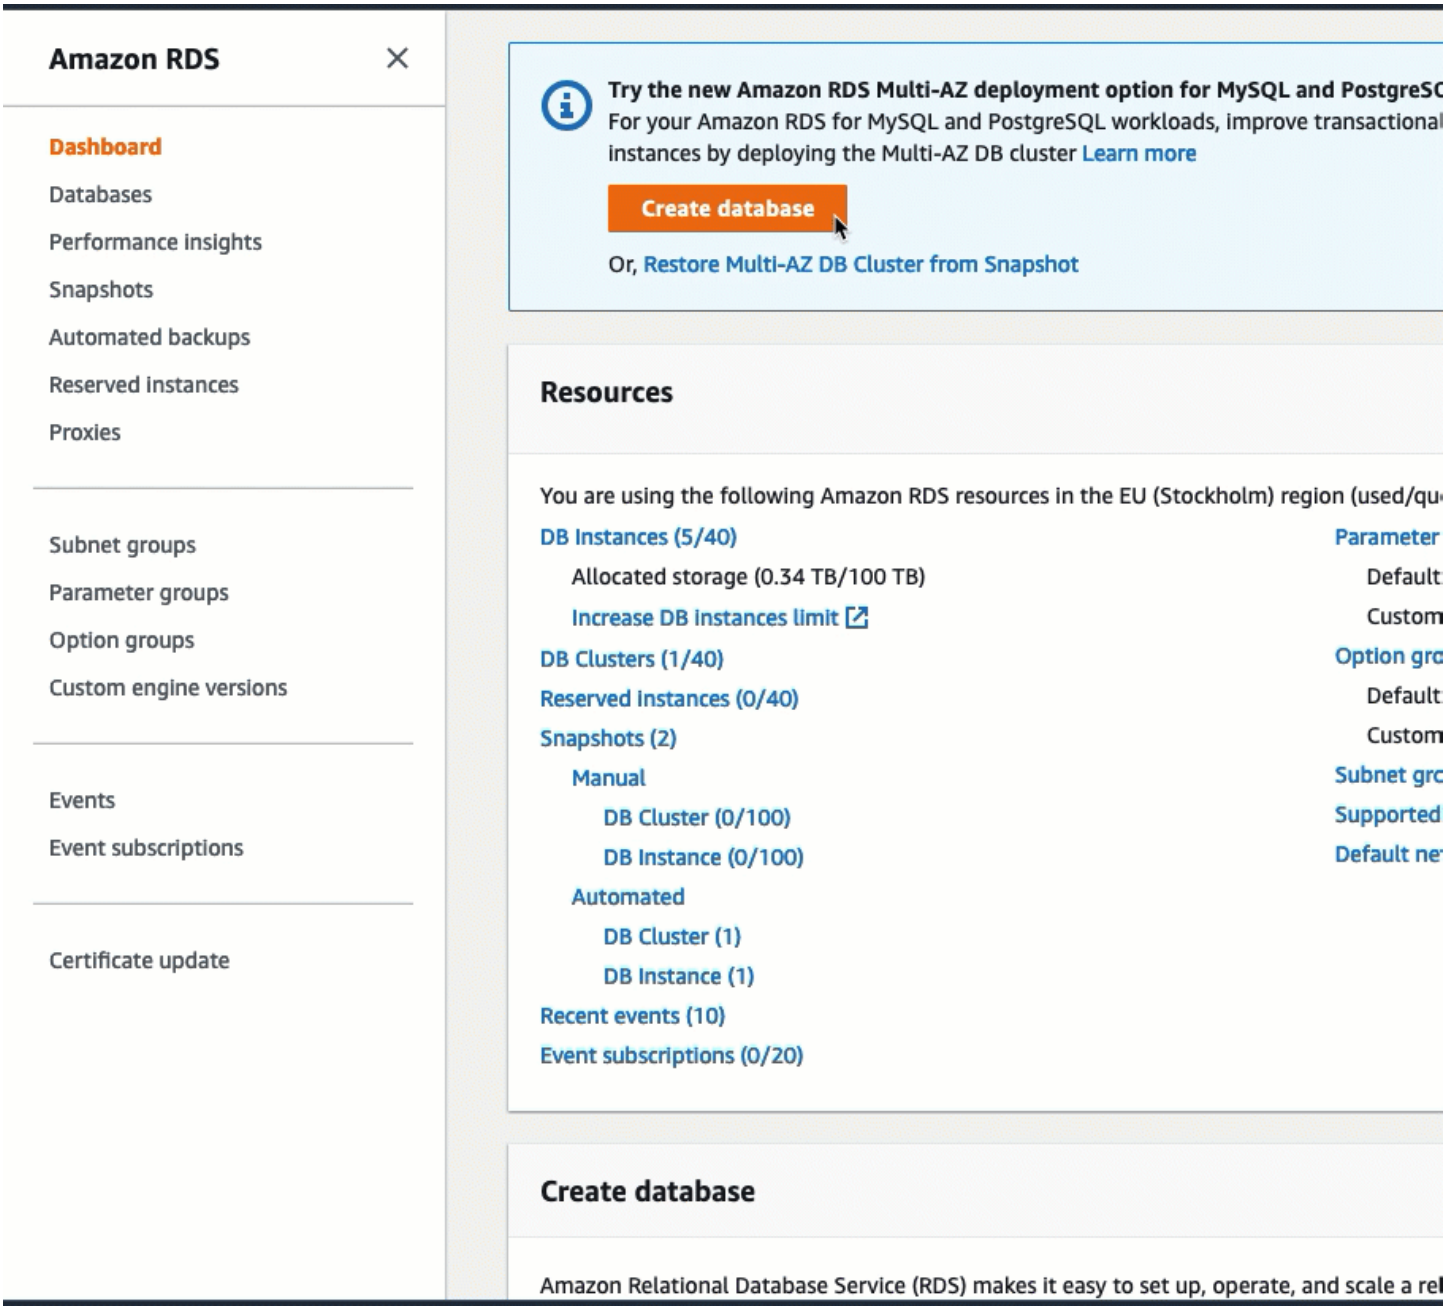
To create an RDS database and automatically connect it to an EC2 instance

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. From the Region selector (at top right), choose the AWS Region in which you created the EC2 instance. The EC2 instance and the RDS database must be in the same Region.
3. On the dashboard, choose **Create database**.
4. Under **Choose a database creation method**, check that **Standard create** is selected. If you choose **Easy create**, the automatic connection feature is not available.
5. Under **Engine options**, for **Engine type**, choose **MySQL**.
6. Under **Templates**, choose a sample template to meet your needs. For this tutorial, choose **Free tier** to create an RDS database at no cost. However, note that the Free Tier is only available if your account qualifies for the Free Tier. You can read more by choosing the **Info** link in the **Free tier** box.
7. Under **Settings**, do the following:

    a. For **DB instance identifier**, enter a name for the database. For this tutorial, enter **`tutorial-database`**.

    b. For **Master username**, leave the default name, which is **`admin`**.

c. For **Master password**, enter a password that you can remember for this tutorial, and then, for **Confirm password**, enter the password again.



8. Under **Instance configuration**, for **DB instance class**, leave the default, which is **db.t3.micro**.
9. Under **Connectivity**, for **Compute resource**, choose **Connect to an EC2 compute resource**. This is the automatic connection feature in the RDS console .
10. For **EC2 instance**, choose the EC2 instance that you want to connect to. For the purposes of this tutorial, you can either choose the instance that you created in the previous task, which you named **`tutorial-instance`**, or choose another existing instance. If you don't see your instance in the list, choose the refresh icon to the right of **Connectivity**.

    When you use the automatic connection feature, a security group is added to this EC2 instance, and another security group is added to the RDS database. The security groups are automatically configure to allow traffic between the EC2 instance and the RDS database. In the next task, you'll verify that the security groups were created and assigned to the EC2 instance and RDS database.
11. Choose **Create database**.

    On the **Databases** screen, the **Status** of the new database is **Creating** until the database is ready to use. When the status changes to **Available**, you can connect to the database. Depending on the database class and the amount of storage, it can take up to 20 minutes before the new database is available.

To learn more, see Configure automatic network connectivity with an EC2 instance in the *Amazon RDS User Guide*.

View an animation: Create an RDS database and automatically connect it to an EC2 instance

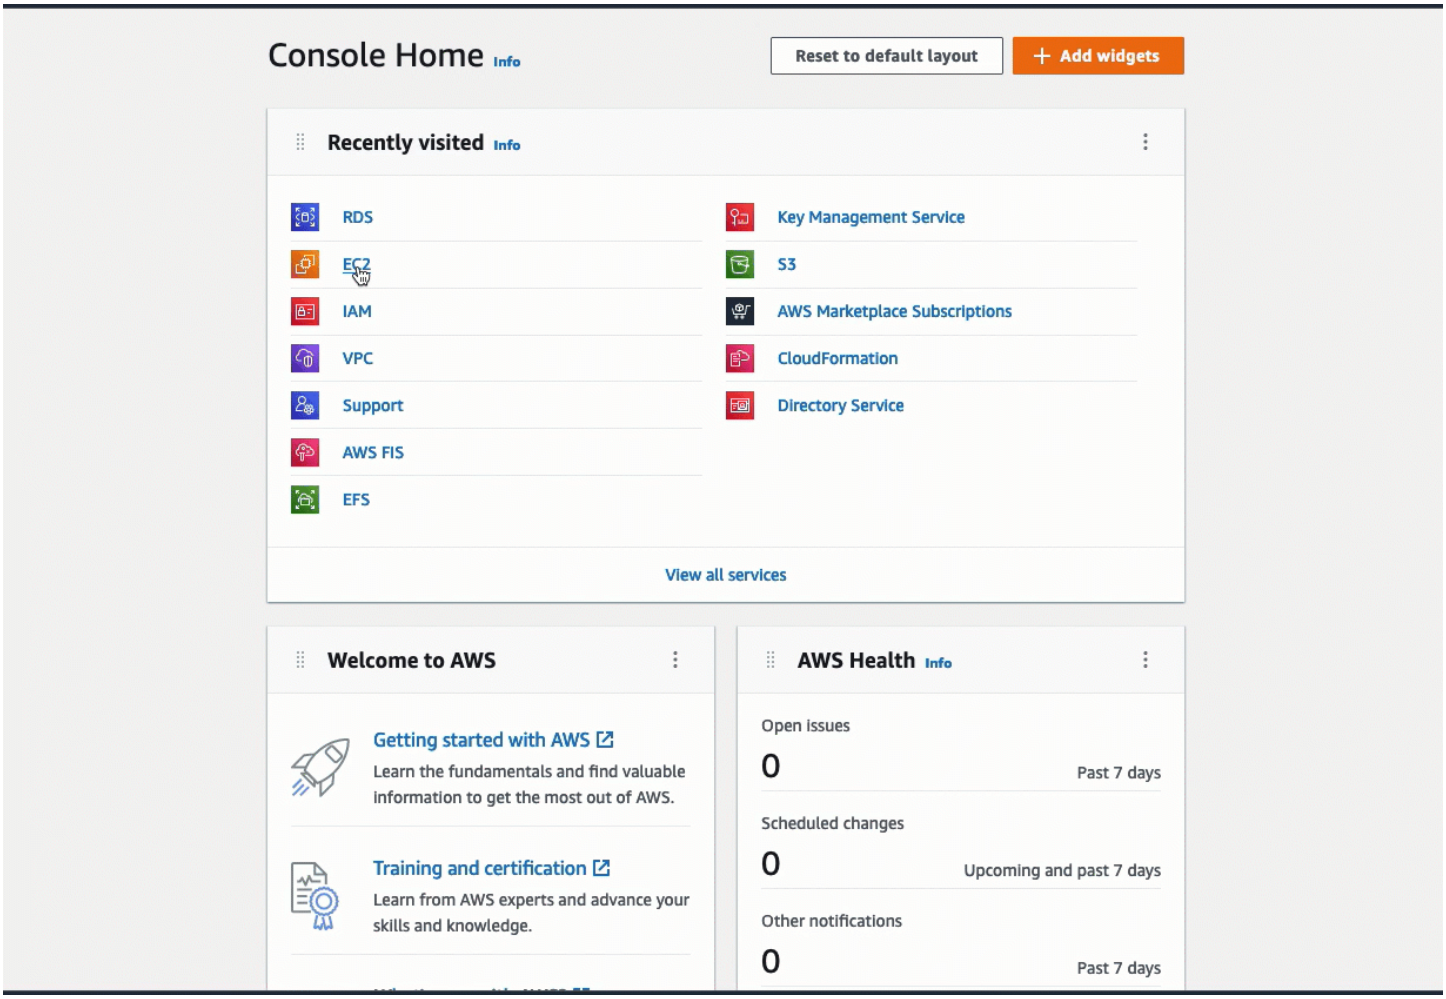
Task 3: Verify the connection configuration

The objective of this task is to verify that the two security groups were created and assigned to the instance and database.

When you use the automatic connection feature in the console to configure the connectivity, the security groups are automatically created and assigned to the instance and database, as follows:

- Security group **rds-ec2-*x*** is created and added to the RDS database. It has one inbound rule that references the **ec2-rds-*x*** security group as its source. This allows traffic from the EC2 instance with the **ec2-rds-*x*** security group to reach the RDS database.
- Security group **ec2-rds-*x*** is created and added to the EC2 instance. It has one outbound rule that references the **rds-ec2-*x*** security group as its destination. This allows traffic from the EC2 instance to reach the RDS database with the **rds-ec2-*x*** security group.

To verify the connection configuration using the console



1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. In the navigation page, choose **Databases**.
3. Choose the RDS database that you created for this tutorial.
4. On the **Connectivity & security** tab, under **Security**, **VPC security groups**, verify that a security group called **rds-ec2-*x*** is displayed.
5. Choose the **rds-ec2-*x*** security group. The **Security Groups** screen in the EC2 console opens.
6. Choose the **rds-ec2-*x*** security group to open it.
7. Choose the **Inbound rules** tab.
8. Verify that the following security group rule exists, as follows:
   - Type: **MYSQL/Aurora**
   - Port range: **3306**
   - Source: ***sg-0987654321example*** **/ ec2-rds-*x*** – This is the security group that is assigned to the EC2 instance that you verified in the preceding steps.
   - Description: **Rule to allow connections from EC2 instances with *sg-1234567890example* attached**
9. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
10. In the navigation pane, choose **Instances**.
11. Choose the EC2 instance that you selected to connect to the RDS database in the previous task, and choose the **Security** tab.
12. Under **Security details**, **Security groups**, verify that a security group called **ec2-rds-*x*** is in the list. *x* is a number.
13. Choose the **ec2-rds-*x*** security group to open it.
14. Choose the **Outbound rules** tab.

15. Verify that the following security group rule exists, as follows:

    - Type: **MYSQL/Aurora**
    - Port range: **3306**
    - Destination: ***sg-1234567890example*** **/ rds-ec2-*x***
    - Description: **Rule to allow connections to `database-tutorial` from any instances this security group is attached to**

By verifying that these security groups and security group rules exist and that they are assigned to the RDS database and EC2 instance as described in this procedure, you can verify that the connection was automatically configured by using the automatic connection feature.

View an animation: Verify the connection configuration

You have completed Option 2 of this tutorial. You can now either complete Option 3, which teaches you how to manually configure the security groups that were automatically created in Option 2.

Task 4 (*Optional*): Clean up

> **Warning**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

Now that you have completed the tutorial, it is good practice to clean up (delete) any resources you no longer want to use. Cleaning up AWS resources prevents your account from incurring any further charges.

If you launched an EC2 instance specifically for this tutorial, you can terminate it to stop incurring any charges associated with it.

To terminate an instance using the console

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that you created for this tutorial, and choose **Instance state**, **Terminate instance**.
4. Choose **Terminate** when prompted for confirmation.

If you created an RDS database specifically for this tutorial, you can delete it to stop incurring any charges associated with it.

To delete an RDS database using the console

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.

2. In the navigation pane, choose **Databases**.
3. Select the RDS database that you created for this tutorial, and choose **Actions**, **Delete**.
4. Enter **`delete me`** in the box, and then choose **Delete**.

Option 3: Manually connect an instance to an RDS database by creating security groups

The objective of Option 3 is to learn how to manually configure the connection between an EC2 instance and an RDS database by manually reproducing the configuration of the automatic connection feature.

Tasks

- Before you begin
- Task 1 (Optional): Launch an EC2 instance
- Task 2 (Optional): Create an RDS database
- Task 3: Manually connect your EC2 instance to your RDS database by creating security groups and assigning them to the instances
- Task 4 (Optional): Clean up

Before you begin

You'll need the following to complete this tutorial:

- An EC2 instance that is in the same VPC as the RDS database. You can either use an existing EC2 instance or follow the steps in Task 1 to create a new instance.
- An RDS database that is in the same VPC as the EC2 instance. You can either use an existing RDS database or follow the steps in Task 2 to create a new database.
- Permissions to call the following operations:
  - `ec2:AssociateRouteTable`
  - `ec2:AuthorizeSecurityGroupEgress`
  - `ec2:CreateRouteTable`
  - `ec2:CreateSecurityGroup`
  - `ec2:CreateSubnet`

- `ec2:DescribeInstances`
- `ec2:DescribeNetworkInterfaces`
- `ec2:DescribeRouteTables`
- `ec2:DescribeSecurityGroups`
- `ec2:DescribeSubnets`
- `ec2:ModifyNetworkInterfaceAttribute`
- `ec2:RevokeSecurityGroupEgress`

Task 1 (*Optional*): Launch an EC2 instance

> **Note**
>
> Launching an instance is not the focus of this tutorial. If you already have an Amazon EC2 instance and would like to use it in this tutorial, you can skip this task.

The objective of this task is to launch an EC2 instance so that you can complete Task 3 where you configure the connection between your EC2 instance and your Amazon RDS database. The steps in this task configure the EC2 instance as follows:

- Instance name: **`tutorial-instance`**
- AMI: Amazon Linux 2
- Instance type: `t2.micro`
- Auto-assign public IP: Enabled
- Security group with the following three rules:
  - Allow SSH from your IP address
  - Allow HTTPS traffic from anywhere
  - Allow HTTP traffic from anywhere

> **Important**
>
> In a production environment, you should configure your instance to meet your specific needs.

To launch an EC2 instance

1. Sign in to the AWS Management Console and open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. On the **EC2 Dashboard**, choose **Launch instance**.
3. Under **Name and tags**, for **Name**, enter a name to identify your instance. For this tutorial, name the instance **`tutorial-instance-manual-1`**. While the instance name is not mandatory, the name will help you easily identify it.
4. Under **Application and OS Images**, choose an AMI that meets your web server needs. This tutorial uses **Amazon Linux**.
5. Under **Instance type**, for **Instance type**, select an instance type that meets your web server needs. This tutorial uses `t2.micro`.
6. Under **Key pair (login)**, for **Key pair name**, choose your key pair.
7. Under **Network settings**, do the following:

   a. For **Network** and **Subnet**, if you haven't made changes to your default VPC or subnets, you can keep the default settings.

      If you have made changes to your default VPC or subnets, check the following:

      i. The instance must be in the same VPC as the RDS database. By default you have only one VPC.

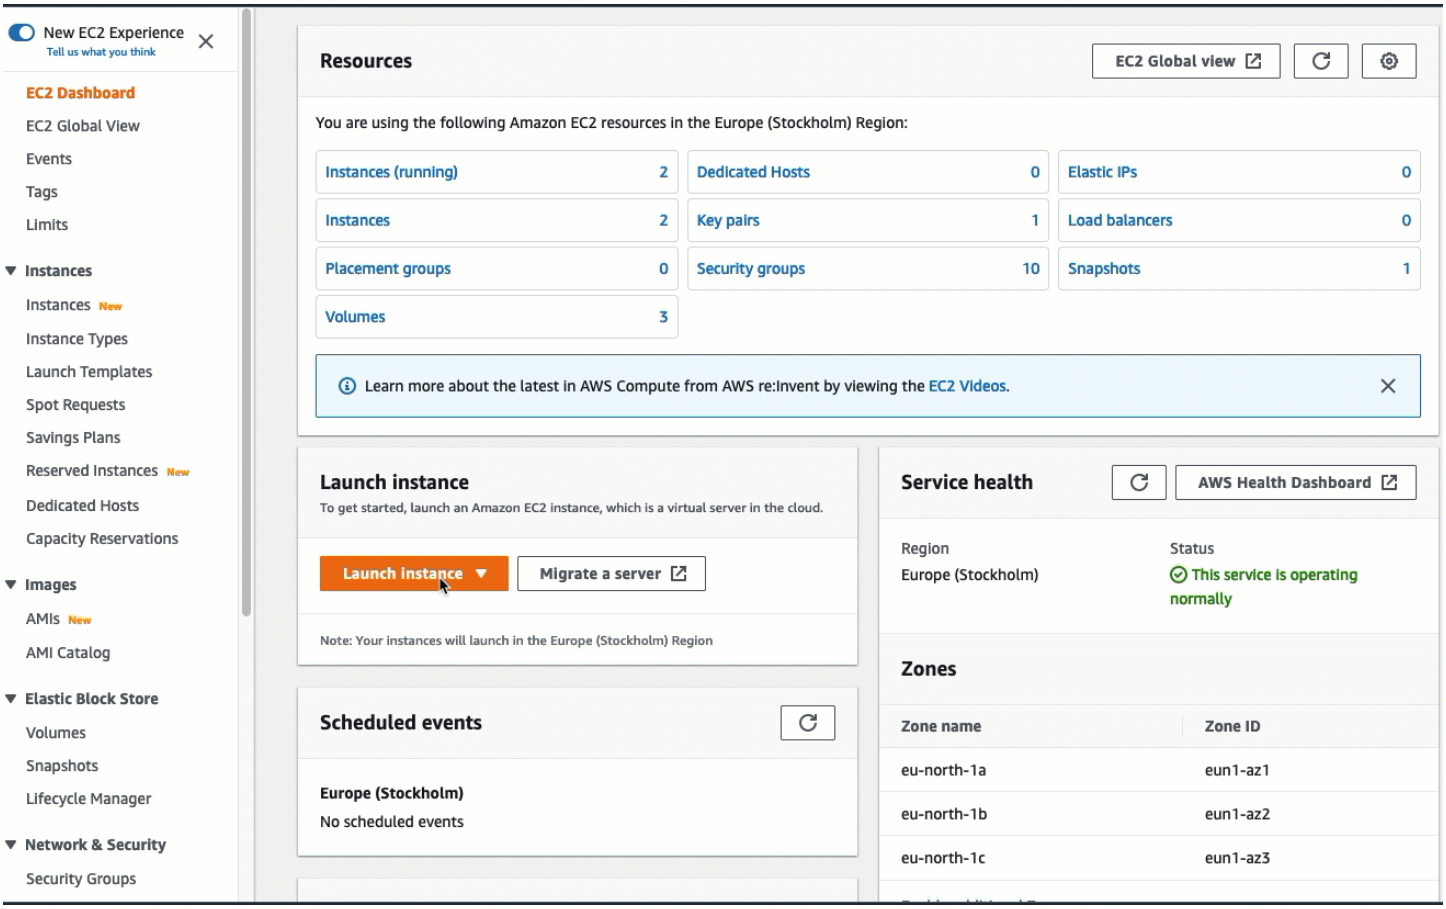
      ii. The VPC that you're launching your instance into must have an internet gateway attached to it so that you can access your web server from the internet. Your default VPC is automatically set up with an internet gateway.

      iii. To ensure that your instance receives a public IP address, for **Auto-assign public IP**, check that **Enable** is selected. If **Disable** is selected, choose **Edit** (to the right of **Network Settings**), and then, for **Auto-assign public IP**, choose **Enable**.

   b. To connect to your instance by using SSH, you need a security group rule that authorizes SSH (Linux) or RDP (Windows) traffic from your computer's public IPv4 address. By default, when you launch an instance, a new security group is created with a rule that allows inbound SSH traffic from anywhere.

      To make sure that only your IP address can connect to your instance, under **Firewall (security groups)**, from the drop-down list next to the **Allow SSH traffic from** checkbox, choose **My IP**.

c. To allow traffic from the internet to your instance, select the following checkboxes:



- **Allow HTTPs traffic from the internet**
- **Allow HTTP traffic from the internet**

8. In the **Summary** panel, review your instance configuration and then choose **Launch instance**.
9. Choose **View all instances** to close the confirmation page and return to the console. Your instance will first be in a `pending` state, and will then go into the `running` state.

   If the instance fails to launch or the state immediately goes to `terminated` instead of `running`, see Troubleshoot Amazon EC2 instance launch issues.

For more information about launching an instance, see Launch an EC2 instance using the launch instance wizard in the console.

View an animation: Launch an EC2 instance

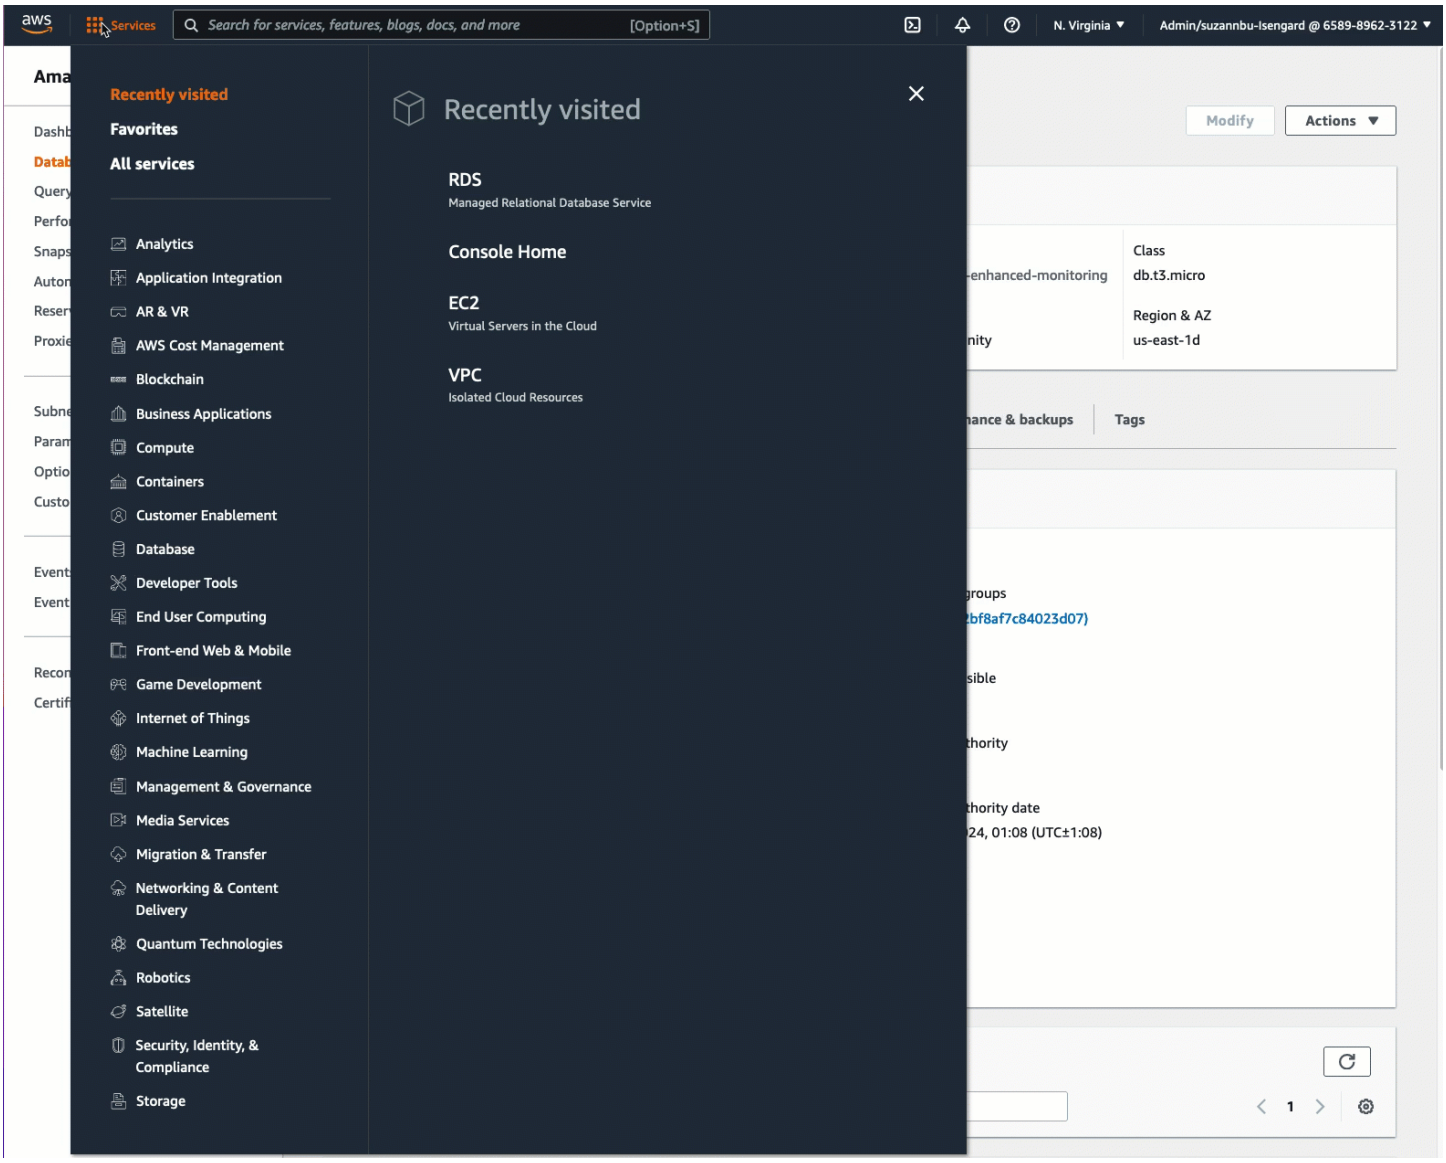
Task 2 (*Optional*): Create an RDS database

> **Note**
>
> Creating an RDS database is not the focus of this part of the tutorial. If you already have an RDS database and would like to use it for this tutorial, you can skip this task.

The objective of this task is to create an RDS database. You'll use this instance in Task 3 when you connect it to your EC2 instance. The steps in this task configure the RDS database as follows:

- Engine type: MySQL
- Template: Free tier
- DB instance identifier: **`tutorial-database-manual`**
- DB instance class: db`.t3.micro`

> **Important**
>
> In a production environment, you should configure your instance to meet your specific needs.



To create a MySQL DB instance

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.
2. From the Region selector (at top right), choose the AWS Region in which you created the EC2 instance. The EC2 instance and the DB instance must be in the same Region.
3. On the dashboard, choose **Create database**.
4. Under **Choose a database creation method**, choose **Easy create**. When you choose this option, the automatic connection feature to automatically configure the connection is not available.
5. Under **Engine options**, for **Engine type**, choose **MySQL**.
6. For **DB instance size**, choose **Free tier**.
7. For **DB instance identifier** enter a name for the RDS database. For this tutorial, enter **`tutorial-database-manual`**.

8. For **Master username**, leave the default name, which is **`admin`**.
9. For **Master password**, enter a password that you can remember for this tutorial, and then, for **Confirm password**, enter the password again.
10. Choose **Create database**.

    On the **Databases** screen, the **Status** of the new DB instance is **Creating** until the DB instance is ready to use. When the status changes to **Available**, you can connect to the DB instance. Depending on the DB instance class and the amount of storage, it can take up to 20 minutes before the new instance is available.

View an animation: Create a DB instance

Task 3: Manually connect your EC2 instance to your RDS database by creating security groups and assigning them to the instances

The objective of this task is to reproduce the connection configuration of the automatic connection feature by performing the following manually: You create two new security groups, and then add a security group each to the EC2 instance and the RDS database.

To create two new security groups and assign one each to the EC2 instance and RDS database

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. First create the security group to add to the EC2 instance, as follows:
   a. In the navigation pane, choose **Security Groups**.
   b. Choose **Create security group**.
   c. For **Security group name**, enter a descriptive name for the security group. For this tutorial, enter **`ec2-rds-manual-configuration`**.
   d. For **Description**, enter a brief description. For this tutorial, enter **`EC2 instance security group to allow EC2 instance to securely connect to RDS database`**.
   e. Choose **Create security group**. You'll come back to this security group to add an outbound rule after you've created the RDS database security group.
3. Now, create the security group to add to the RDS database, as follows:
   a. In the navigation pane, choose **Security Groups**.
   b. Choose **Create security group**.
   c. For **Security group name**, enter a descriptive name for the security group. For this tutorial, enter **`rds-ec2-manual-configuration`**.
   d. For **Description**, enter a brief description. For this tutorial, enter **`RDS database security group to allow EC2 instance to securely connect to RDS database`**.
   e. Under **Inbound rules**, choose **Add rule**, and do the following:
      i. For **Type**, choose **MYSQL/Aurora**.
      ii. For **Source**, choose the EC2 instance security group **ec2-rds-manual-configuration** that you created in Step 2 of this procedure.
   f. Choose **Create security group**.

4. Edit the EC2 instance security group to add an outbound rule, as follows:

   a. In the navigation pane, choose **Security Groups**.

   b. Select the EC2 instance security group (you named it **`ec2-rds-manual-configuration`**), and choose the **Outbound rules** tab.

   c. Choose **Edit outbound rules**.

   d. Choose **Add rule**, and do the following:

      i. For **Type**, choose **MYSQL/Aurora**.

      ii. For **Destination**, choose the RDS database security group **rds-ec2-manual-configuration** that you created in Step 3 of this procedure.

      iii. Choose **Save rules**.

5. Add the EC2 instance security group to the EC2 instance as follows:

   a. In the navigation pane, choose **Instances**.

   b. Select your EC2 instance, and choose **Actions**, **Security**, **Change security groups**.

   c. Under **Associated security groups**, choose the **Select security groups** field, choose **ec2-rds-manual-configuration** that you created earlier, and then choose **Add security group**.

   d. Choose **Save**.

6. Add the RDS database security group to the RDS database as follows:

   a. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.

   b. In the navigation pane, choose **Databases** and select your database.

   c. Choose **Modify**.

   d. Under **Connectivity**, for **Security group**, choose **rds-ec2-manual-configuration** that you created earlier, and then choose **Continue**.

   e. Under **Scheduling of modifications**, choose **Apply immediately**.

   f. Choose **Modify DB instance**.

   You have now completed the manual steps that mimic the automatic steps that occur when you use the automatic connection feature.

You have completed Option 3 of this tutorial. If you've completed Options 1, 2, and 3, and you no longer need the resources that were created in this tutorial, you should delete them to prevent incurring unnecessary costs. For more information, see Task 4 (*Optional*): Clean up.

Task 4 (*Optional*): Clean up

> **Warning**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

Now that you have completed the tutorial, it is good practice to clean up (delete) any resources you no longer want to use. Cleaning up AWS resources prevents your account from incurring any further charges.

If you launched an EC2 instance specifically for this tutorial, you can terminate it to stop incurring any charges associated with it.

To terminate an instance using the console

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that you created for this tutorial, and choose **Instance state**, **Terminate instance**.
4. Choose **Terminate** when prompted for confirmation.

If you created an RDS database specifically for this tutorial, you can delete it to stop incurring any charges associated with it.

To delete an RDS database using the console

1. Open the Amazon RDS console at https://eusc-de-east-1.console.amazonaws-eusc.eu/rds/.

2. In the navigation pane, choose **Databases**.
3. Select the RDS database that you created for this tutorial, and choose **Actions**, **Delete**.
4. Enter **`delete me`** in the box, and then choose **Delete**.

EC2 Fleet and Spot Fleet

EC2 Fleet and Spot Fleet are designed to be a useful way to launch a fleet of tens, hundreds, or thousands of Amazon EC2 instances in a single operation. Each instance in a fleet is either configured by a launch template or a set of launch parameters that you configure manually at launch.

Topics

- Features and benefits
- Which is the best fleet method to use?
- Configuration options for your EC2 Fleet or Spot Fleet
- Work with EC2 Fleet
- Work with Spot Fleet
- Monitor your EC2 Fleet or Spot Fleet
- Tutorials for EC2 Fleet
- Example CLI configurations for EC2 Fleet
- Example CLI configurations Spot Fleet
- Quotas for EC2 Fleet and Spot Fleet

Features and benefits

Fleets provide the following features and benefits, enabling you to maximize cost savings and optimize availability and performance when running applications on multiple EC2 instances.

Multiple instance types

A fleet can launch multiple instance types, ensuring it isn't dependent on the availability of any single instance type. This increases the overall availability of instances in your fleet.

Distributing instances across Availability Zones

A fleet can launch into multiple Availability Zones, enabling you to reduce costs and improve availability. If your fleet includes Spot Instances, the fleet automatically selects Availability Zones based on your preferences regarding price and interruptions.

Multiple purchasing options

A fleet can launch multiple purchase options (Spot and On-Demand Instances), allowing you to optimize costs through Spot Instance usage. You can also take advantage of Reserved Instance and Savings Plans discounts by using them in conjunction with On-Demand Instances in the fleet.

Automated replacement of Spot Instances

If your fleet includes Spot Instances, it can automatically request replacement Spot capacity if your Spot Instances are interrupted. Through Capacity Rebalancing, a fleet can also monitor and proactively replace your Spot Instances that are at an elevated risk of interruption.

Reserve On-Demand capacity

A fleet can use an On-Demand Capacity Reservation to reserve On-Demand capacity. A fleet can also include Capacity Blocks for ML, allowing you to reserve GPU instances on a future date to support short duration machine learning (ML) workloads.

Which is the best fleet method to use?

As a general best practice, we recommend launching fleets of Spot and On-Demand Instances with Amazon EC2 Auto Scaling because it provides additional features you can use to manage your fleet. The list of additional features includes automatic health check replacements for both Spot and On-Demand Instances, application-based health checks, and an integration with Elastic Load Balancing to ensure an even distribution of application traffic to your healthy instances. You can also use Auto Scaling groups when you use AWS services such as Amazon ECS, Amazon EKS (self-managed node groups), and Amazon VPC Lattice. For more information, see the Amazon EC2 Auto Scaling User Guide.

If you can't use Amazon EC2 Auto Scaling, then you might consider using EC2 Fleet or Spot Fleet. EC2 Fleet and Spot Fleet offer the same core functionality. However, EC2 Fleet is only available using a command line and does not provide console support. Spot Fleet provides console support, but uses a legacy API with no planned investment.

Use the following table to determine which fleet method to use.

Fleet method	When to use?	Use case
Amazon EC2 Auto Scaling	• You need multiple instances with either a single configuration or a mixed configuration. • You want to automate the lifecycle management of your instances.	Create an Auto Scaling group that manages the lifecycle of your instances while maintaining the desired number of instances. Supports horizontal scaling (adding more instances) between specified minimum and maximum limits.
EC2 Fleet	• You need multiple instances with either a single configuration or a mixed configuration. • You want to self-manage your instance lifecycle. • If you don't need auto scaling, we recommend that you use an `instant` type EC2 Fleet.	Create an `instant` fleet of both On-Demand Instances and Spot Instances in a single operation, with multiple launch specifications that vary by instance type, AMI, Availability Zone, or subnet. The Spot Instance allocation strategy defaults to `lowest-price` per unit, but we recommend changing it to `price-capacity-optimized`.
Spot Fleet	• We strongly discourage using Spot Fleet because it uses a legacy API with no planned investment. • If you want to manage your instance lifecycle, rather use EC2 Fleet. • If you don't want to manage your instance lifecycle, rather use an Auto Scaling group.	Use Spot Fleet only if you need console support for a use case for when you would use EC2 Fleet.

Configuration options for your EC2 Fleet or Spot Fleet

When planning your EC2 Fleet or Spot Fleet, we recommend that you consider the following options when deciding how to configure your fleet.

Configuration option	Question	Documentation
Fleet request type	Do you want a fleet that submits a one-time request for the desired target capacity, or a fleet that maintains target capacity over time?	EC2 Fleet and Spot Fleet request types
Spot Instances	Do you plan to include Spot Instances in your fleet? Review the Spot best practices and use them when you plan your fleet so that you can provision the instances at the lowest possible price.	Best practices for Amazon EC2 Spot
Spending limit for your fleet	Do you want to limit how much you'll pay for your fleet per hour?	Set a spending limit for your EC2 Fleet or Spot Fleet
Instance types and attribute-based instance type selection	Do you want to specify the instance types in your fleet, or let Amazon EC2 select the instance types that meet your application requirements?	Specify attributes for instance type selection for EC2 Fleet or Spot Fleet
Instance weighting	Do you want to assign weights to each instance type to represent their compute capacity and performance, so that Amazon EC2 can select any combination of available instance types to fulfil your desired target capacity?	Use instance weighting to manage cost and performance of your EC2 Fleet or Spot Fleet

Configuration option	Question	Documentation
Allocation strategies	Do you want to decide whether to optimize for available capacity, price, or instance types to use for the Spot Instances and On-Demand Instances in your fleet?	Use allocation strategies to determine how EC2 Fleet or Spot Fleet fulfills Spot and On-Demand capacity
Capacity Rebalancing	Do you want your fleet to automatically replace at-risk Spot Instances?	Use Capacity Rebalancing in EC2 Fleet and Spot Fleet to replace at-risk Spot Instances
On-Demand Capacity Reservation	Do you want to reserve capacity for the On-Demand Instances in your fleet?	Use Capacity Reservations to reserve On-Demand capacity in EC2 Fleet
Multiple Capacity Reservation types	Do you want to launch instances across multiple Capacity Reservation types – On-Demand Capacity Reservations, Capacity Blocks for ML, and interruptible Capacity Reservations – using a single Capacity Reservation Resource Group, and optionally fall back to On-Demand capacity?	Tutorial: Configure your EC2 Fleet to launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group

EC2 Fleet and Spot Fleet request types

> **Note**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

The request type for an EC2 Fleet or Spot Fleet determines whether the request is synchronous or asynchronous, and whether it is a one-time request for the desired target capacity or an ongoing

effort to maintain the capacity over time. When configuring your fleet, you must specify the request type.

Both EC2 Fleet and Spot Fleet offer two request types: `request` and `maintain`. In addition, EC2 Fleet offers a third request type called `instant`.

Fleet request types

`instant` (EC2 Fleet only)

If you configure the request type as `instant`, EC2 Fleet places a synchronous one-time request for your desired capacity. In the API response, it returns the instances that launched and provides errors for those instances that could not be launched. For more information, see Configure an EC2 Fleet of type instant.

`request`

If you configure the request type as `request`, the fleet places an asynchronous one-time request for your desired capacity. If capacity diminishes due to Spot interruptions, the fleet does not attempt to replenish Spot Instances, nor does it submit requests in alternative Spot capacity pools if capacity is unavailable. When creating a Spot Fleet of type `request` using the console, clear the **Maintain target capacity** checkbox.

`maintain` (default)

If you configure the request type as `maintain`, the fleet places an asynchronous request for your desired capacity, and maintains it by automatically replenishing any interrupted Spot Instances. When creating a Spot Fleet of type `maintain` using the console, select the **Maintain target capacity** checkbox

Configure an EC2 Fleet of type instant

The EC2 Fleet of type *instant* is a synchronous one-time request that makes only one attempt to launch your desired capacity. The API response lists the instances that launched, along with errors for those instances that could not be launched. There are several benefits to using an EC2 Fleet of type *instant*, which are described in this article. Example configurations are provided at the end of the article.

For workloads that need a launch-only API to launch EC2 instances, you can use the RunInstances API. However, with RunInstances, you can only launch On-Demand Instances or Spot Instances, but not both in the same request. Furthermore, when you use RunInstances to launch Spot Instances,

your Spot Instance request is limited to one instance type and one Availability Zone. This targets a single Spot capacity pool (a set of unused instances with the same instance type and Availability Zone). If the Spot capacity pool does not have sufficient Spot Instance capacity for your request, the RunInstances call fails.

Instead of using RunInstances to launch Spot Instances, we recommend that you rather use the CreateFleet API with the `type` parameter set to `instant` for the following benefits:

- **Launch On-Demand Instances and Spot Instances in one request.** An EC2 Fleet can launch On-Demand Instances, Spot Instances, or both. The request for Spot Instances is fulfilled if there is available capacity and the maximum price per hour for your request exceeds the Spot price.
- **Increase the availability of Spot Instances.** By using an EC2 Fleet of type `instant`, you can launch Spot Instances following Spot best practices with the resulting benefits:
  - **Spot best practice: Be flexible about instance types and Availability Zones.**

    Benefit: By specifying several instance types and Availability Zones, you increase the number of Spot capacity pools. This gives the Spot service a better chance of finding and allocating your desired Spot compute capacity. A good rule of thumb is to be flexible across at least 10 instance types for each workload and make sure that all Availability Zones are configured for use in your VPC.
  - **Spot best practice: Use the price-capacity-optimized allocation strategy.**

    Benefit: The `price-capacity-optimized` allocation strategy identifies instances from the most-available Spot capacity pools, and then automatically provisions instances from the lowest priced of these pools. Because your Spot Instance capacity is sourced from pools with optimal capacity, this decreases the possibility that your Spot Instances will be interrupted when Amazon EC2 needs the capacity back.
- **Get access to a wider set of capabilities.** For workloads that need a launch-only API, and where you prefer to manage the lifecycle of your instance rather than let EC2 Fleet manage it for you, use the EC2 Fleet of type `instant` instead of the RunInstances API. EC2 Fleet provides a wider set of capabilities than RunInstances, as demonstrated in the following examples. For all other workloads, you should use Amazon EC2 Auto Scaling because it supplies a more comprehensive feature set for a wide variety of workloads, like ELB-backed applications, containerized workloads, and queue processing jobs.

You can use EC2 Fleet of type *instant* to launch instances into Capacity Blocks. For more information, see Tutorial: Configure your EC2 Fleet to launch instances into Capacity Blocks.

AWS services like Amazon EC2 Auto Scaling and Amazon EMR use EC2 Fleet of type *instant* to launch EC2 instances.

Prerequisites for EC2 Fleet of type instant

For the prerequisites for creating an EC2 Fleet, see EC2 Fleet prerequisites.

How instant EC2 Fleet works

When working with an EC2 Fleet of type `instant`, the sequence of events is as follows:

1. **Configure:** Configure the CreateFleet request type as `instant`. For more information, see Create an EC2 Fleet. Note that after you make the API call, you can't modify it.
2. **Request:** When you make the API call, Amazon EC2 places a synchronous one-time request for your desired capacity.
3. **Response:** The API response lists the instances that launched, along with errors for those instances that could not be launched.
4. **Describe:** You can describe your EC2 Fleet, list the instances associated with your EC2 Fleet, and view the history of your EC2 Fleet.
5. **Terminate instances:** You can terminate the instances at any time.
6. **Delete fleet request:** The fleet request can be deleted either manually or automatically:
   - Manual: You can delete the fleet request after your instances launch.

     Note that a deleted `instant` fleet with running instances is not supported. When you delete an `instant` fleet, Amazon EC2 automatically terminates all its instances. For fleets with more than 1000 instances, the deletion request might fail. If your fleet has more than 1000 instances, first terminate most of the instances manually, leaving 1000 or fewer. Then delete the fleet, and the remaining instances will be terminated automatically.
   - Automatic: Amazon EC2 deletes the fleet request some time after either:
     - All the instances are terminated.
     - The fleet fails to launch any instances.

Examples

The following examples show how to use EC2 Fleet of type `instant` for different use cases. For more information about using the EC2 CreateFleet API parameters, see CreateFleet in the *Amazon EC2 API Reference*.

Examples

- Example 1: Launch Spot Instances with the capacity-optimized allocation strategy
- Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy
- Example 3: Launch Spot Instances using instance weighting
- Example 4: Launch Spot Instances within single Availability Zone
- Example 5: Launch Spot Instances of single instance type within single Availability zone
- Example 6: Launch Spot Instances only if minimum target capacity can be launched
- Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone
- Example 8: Launch instances with multiple Launch Templates
- Example 9: Launch Spot Instance with a base of On-Demand Instances
- Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy
- Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy
- Example 12: Specify a Systems Manager parameter instead of an AMI ID

Example 1: Launch Spot Instances with the capacity-optimized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type `instant`: a launch template, target capacity, default purchasing option, and launch template overrides.

- The launch template is identified by its launch template name and version number.
- The 12 launch template overrides specify 4 different instance types and 3 different subnets, each in a separate Availability Zone. Each instance type and subnet combination defines a Spot capacity pool, resulting in 12 Spot capacity pools.
- The target capacity for the fleet is 20 instances.
- The default purchasing option is `spot`, which results in the fleet attempting to launch 20 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 2: Launch a single Spot Instance with the capacity-optimized allocation strategy

You can optimally launch one Spot Instance at a time by making multiple EC2 Fleet API calls of type `instant`, by setting the TotalTargetCapacity to 1.

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch template overrides have 4 different instance types and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 1 instance, and the default purchasing option is spot, which results in the fleet attempting to launch a Spot Instance from one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy, to launch a Spot Instance from the most-available capacity pool.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification":{
```

```
            "LaunchTemplateName":"ec2-fleet-lt1",
            "Version":"$Latest"
         },
         "Overrides":[
            {
               "InstanceType":"c5.large",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"c5.large",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"c5.large",
               "SubnetId":"subnet-49e41922"
            },
            {
               "InstanceType":"c5d.large",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"c5d.large",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"c5d.large",
               "SubnetId":"subnet-49e41922"
            },
            {
               "InstanceType":"m5.large",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"m5.large",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5.large",
               "SubnetId":"subnet-49e41922"
            },
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-fae8c380"
            },
```

```
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-49e41922"
            }
         ]
      }
   ],
   "TargetCapacitySpecification": {
       "TotalTargetCapacity": 1,
       "DefaultTargetCapacityType": "spot"
   },
   "Type": "instant"
}
```

Example 3: Launch Spot Instances using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight based on how many units of the workload can run on the instance assuming a unit of the workload requires a 15 GB of memory and 4 vCPUs. For example an m5.xlarge (4 vCPUs and 16 GB of memory) can run one unit and is weighted 1, m5.2xlarge (8 vCPUs and 32 GB of memory) can run 2 units and is weighted 2, and so on. The total target capacity is set to 40 units. The default purchasing option is spot, and the allocation strategy is capacity-optimized, which results in either 40 m5.xlarge (40 divided by 1), 20 m5.2xlarge (40 divided by 2), 10 m5.4xlarge (40 divided by 4), 5 m5.8xlarge (40 divided by 8), or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

For more information, see Use instance weighting to manage cost and performance of your EC2 Fleet or Spot Fleet.

            },
            {
               "InstanceType":"m5.8xlarge",
               "SubnetId":"subnet-fae8c380",
               "WeightedCapacity":8
            },
            {
               "InstanceType":"m5.8xlarge",
               "SubnetId":"subnet-e7188bab",
               "WeightedCapacity":8
            },
            {
               "InstanceType":"m5.8xlarge",
               "SubnetId":"subnet-49e41922",
               "WeightedCapacity":8
            }
         ]
      }
   ],
   "TargetCapacitySpecification":{
      "TotalTargetCapacity":40,
      "DefaultTargetCapacityType":"spot"
   },
   "Type":"instant"
}
```

Example 4: Launch Spot Instances within single Availability Zone

You can configure a fleet to launch all instances in a single Availability Zone by setting the Spot options SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances all in a single AZ, from the Spot capacity pool(s) with optimal capacity using the launch specifications.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
```

```
        "SingleAvailabilityZone": true
    },
    "LaunchTemplateConfigs": [
      {
        "LaunchTemplateSpecification":{
           "LaunchTemplateName":"ec2-fleet-lt1",
           "Version":"$Latest"
        },
        "Overrides":[
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {

               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-49e41922"
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 5: Launch Spot Instances of single instance type within single Availability zone

You can configure a fleet to launch all instances of the same instance type and in a single Availability Zone by setting the SpotOptions SingleInstanceType to true and SingleAvailabilityZone to true.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity is 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances of the same instance type all in a single AZ from the Spot Instance pool with optimal capacity using the launch specifications.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleInstanceType": true,
        "SingleAvailabilityZone": true
    },
    "LaunchTemplateConfigs": [
      {
```

```
        "LaunchTemplateSpecification":{
           "LaunchTemplateName":"ec2-fleet-lt1",
           "Version":"$Latest"
        },
        "Overrides":[
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-49e41922"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-49e41922"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-49e41922"
           },
           {
              "InstanceType":"m5d.4xlarge",
              "SubnetId":"subnet-fae8c380"
```

```
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-49e41922"
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 6: Launch Spot Instances only if minimum target capacity can be launched

You can configure a fleet to launch instances only if the minimum target capacity can be launched by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together.

When specifying MinTargetCapacity, you must specify at least one of these parameters: SingleInstanceType or SingleAvailabilityZone. In this example, SingleInstanceType is specified, so that all 20 instances must use the same instance type.

The 12 launch template overrides have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet launches 20 Spot Instances from the Spot capacity pool with optimal capacity using the launch template overrides, only if it can launch all 20 instances at the same time.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleInstanceType": true,
        "MinTargetCapacity": 20
    },
```

```
    "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification":{
            "LaunchTemplateName":"ec2-fleet-lt1",
            "Version":"$Latest"
         },
         "Overrides":[
            {
               "InstanceType":"c5.4xlarge",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"c5.4xlarge",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"c5.4xlarge",
               "SubnetId":"subnet-49e41922"
            },
            {
               "InstanceType":"c5d.4xlarge",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"c5d.4xlarge",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"c5d.4xlarge",
               "SubnetId":"subnet-49e41922"
            },
            {
               "InstanceType":"m5.4xlarge",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"m5.4xlarge",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5.4xlarge",
               "SubnetId":"subnet-49e41922"
            },
            {
```

```
                "InstanceType":"m5d.4xlarge",
                "SubnetId":"subnet-fae8c380"
            },
            {
                "InstanceType":"m5d.4xlarge",
                "SubnetId":"subnet-e7188bab"
            },
            {
                "InstanceType":"m5d.4xlarge",
                "SubnetId":"subnet-49e41922"
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 7: Launch Spot Instances only if minimum target capacity can be launched of same Instance Type in a single Availability Zone

You can configure a fleet to launch instances only if the minimum target capacity can be launched with a single instance type in a single Availability Zone by setting the Spot options MinTargetCapacity to the minimum target capacity you want to launch together along with SingleInstanceType and SingleAvailabilityZone options.

The 12 launch specifications which override the launch template, have different instance types and subnets (each in a separate Availability Zone) but the same weighted capacity. The total target capacity and the minimum target capacity are both set to 20 instances, the default purchasing option is spot, the Spot allocation strategy is capacity-optimized, the SingleInstanceType is true and SingleAvailabilityZone is true. The EC2 Fleet launches 20 Spot Instances of the same Instance type all in a single AZ from the Spot capacity pool with optimal capacity using the launch specifications, only if it can launch all 20 instances at the same time.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "SingleInstanceType": true,
        "SingleAvailabilityZone": true,
```

```
        "MinTargetCapacity": 20
    },
    "LaunchTemplateConfigs": [
      {
        "LaunchTemplateSpecification":{
           "LaunchTemplateName":"ec2-fleet-lt1",
           "Version":"$Latest"
        },
        "Overrides":[
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"c5.4xlarge",
              "SubnetId":"subnet-49e41922"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"c5d.4xlarge",
              "SubnetId":"subnet-49e41922"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-fae8c380"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-e7188bab"
           },
           {
              "InstanceType":"m5.4xlarge",
              "SubnetId":"subnet-49e41922"
```

```
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5d.4xlarge",
               "SubnetId":"subnet-49e41922"
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 8: Launch instances with multiple Launch Templates

You can configure a fleet to launch instances with different launch specifications for different instance types or a group of instance types, by specifying multiple launch templates. In this example we want have different EBS volume sizes for different instance types and we have that configured in the launch templates ec2-fleet-lt-4xl, ec2-fleet-lt-9xl and ec2-fleet-lt-18xl.

In this example, we are using 3 different launch templates for the 3 instance types based on their size. The launch specification overrides on all the launch templates use instance weights based on the vCPUs on the instance type. The total target capacity is 144 units, the default purchasing option is spot, and the Spot allocation strategy is capacity-optimized. The EC2 Fleet can either launch 9 c5n.4xlarge (144 divided by 16) using the launch template ec2-fleet-4xl or 4 c5n.9xlarge (144 divided by 36) using the launch template ec2-fleet-9xl, or 2 c5n.18xlarge (144 divided by 72) using the launch template ec2-fleet-18xl, or a mix of the instance types with weights adding up to the desired capacity based on the capacity-optimized allocation strategy.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
```

```
    },
    "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification":{
            "LaunchTemplateName":"ec2-fleet-lt-18xl",
            "Version":"$Latest"
         },
         "Overrides":[
            {
               "InstanceType":"c5n.18xlarge",
               "SubnetId":"subnet-fae8c380",
               "WeightedCapacity":72
            },
            {
               "InstanceType":"c5n.18xlarge",
               "SubnetId":"subnet-e7188bab",
               "WeightedCapacity":72
            },
            {
               "InstanceType":"c5n.18xlarge",
               "SubnetId":"subnet-49e41922",
               "WeightedCapacity":72
            }
         ]
      },
      {

               "SubnetId":"subnet-49e41922",
               "WeightedCapacity":16
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 144,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 9: Launch Spot Instance with a base of On-Demand Instances

The following example specifies the total target capacity of 20 instances for the fleet, and a target capacity of 5 On-Demand Instances. The default purchasing option is spot. The fleet launches 5 On-Demand Instance as specified, but needs to launch 15 more instances to fulfill the total target capacity. The purchasing option for the difference is calculated as TotalTargetCapacity – OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 15

Spot Instances form one of the 12 Spot capacity pools based on the capacity-optimized allocation strategy.

```

            },
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-fae8c380"
            },
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-e7188bab"
            },
            {
               "InstanceType":"m5d.large",
               "SubnetId":"subnet-49e41922"
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "OnDemandTargetCapacity": 5,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 10: Launch Spot Instances using capacity-optimized allocation strategy with a base of On-Demand Instances using Capacity Reservations and the prioritized allocation strategy

You can configure a fleet to use On-Demand Capacity Reservations first when launching a base of On-Demand Instances with the default target capacity type as spot by setting the usage strategy for Capacity Reservations to use-capacity-reservations-first. And if multiple instance pools have unused Capacity Reservations, the chosen On-Demand allocation strategy is applied. In this example, the On-Demand allocation strategy is prioritized.

In this example, there are 6 available unused Capacity Reservations. This is less than the fleet's target On-Demand capacity of 10 On-Demand Instances.

The account has the following 6 unused Capacity Reservations in 2 pools. The number of Capacity Reservations in each pool is indicated by AvailableInstanceCount.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

The following fleet configuration shows only the pertinent configurations for this example. The On-Demand allocation strategy is prioritized, and the usage strategy for Capacity Reservations is use-capacity-reservations-first. The Spot allocation strategy is capacity-optimized. The total target capacity is 20, the On-Demand target capacity is 10, and the default target capacity type is spot.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized"
    },
    "OnDemandOptions":{

               "SubnetId":"subnet-fae8c380",
               "Priority": 4.0
            },
            {
               "InstanceType":"c5d.large",
               "SubnetId":"subnet-e7188bab",
               "Priority": 5.0
            },
            {
               "InstanceType":"c5d.large",
               "SubnetId":"subnet-49e41922",
               "Priority": 6.0
            },
            {
               "InstanceType":"m5.large",
               "SubnetId":"subnet-fae8c380",
               "Priority": 7.0
            },
            {
               "InstanceType":"m5.large",
               "SubnetId":"subnet-e7188bab",
               "Priority": 8.0
            },
            {
```

```
                "InstanceType":"m5.large",
                "SubnetId":"subnet-49e41922",
                "Priority": 9.0
            },
            {
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-fae8c380",
                "Priority": 10.0
            },
            {
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-e7188bab",
                "Priority": 11.0
            },
            {
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-49e41922",
                "Priority": 12.0
            }
        ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "OnDemandTargetCapacity": 10,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

After you create the instant fleet using the preceding configuration, the following 20 instances are launched to meet the target capacity:

- 7 c5.large On-Demand Instances in us-east-1a – c5.large in us-east-1a is prioritized first, and there are 3 available unused c5.large Capacity Reservations. The Capacity Reservations are used first to launch 3 On-Demand Instances plus 4 additional On-Demand Instances are launched according to the On-Demand allocation strategy, which is prioritized in this example.
- 3 m5.large On-Demand Instances in us-east-1a – m5.large in us-east-1a is prioritized second, and there are 3 available unused m5.large Capacity Reservations.
- 10 Spot Instances from one of the 12 Spot capacity pools that has the optimal capacity according to the capacity-optimized allocation strategy.

After the fleet is launched, you can run describe-capacity-reservations to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the c5.large and m5.large Capacity Reservations were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.large",
    "AvailableInstanceCount": 0
}
```

Example 11: Launch Spot Instances using capacity-optimized-prioritized allocation strategy

The following example specifies the parameters required in an EC2 Fleet of type instant: a launch template, target capacity, default purchasing option, and launch template overrides. The launch template is identified by its launch template name and version number. The 12 launch specifications which override the launch template have 4 different instance types with a priority assigned, and 3 different subnets, each in a separate Availability Zone. The target capacity for the fleet is 20 instances, and the default purchasing option is spot, which results in the fleet attempting to launch 20 Spot Instances from one of the 12 Spot capacity pools based on the capacity-optimized-prioritized allocation strategy, which implements priorities on a best-effort basis, but optimizes for capacity first.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
    },
    "LaunchTemplateConfigs": [
      {
         "LaunchTemplateSpecification":{
            "LaunchTemplateName":"ec2-fleet-lt1",
            "Version":"$Latest"
         },
         "Overrides":[
            {
               "InstanceType":"c5.large",
```

```
            "SubnetId":"subnet-fae8c380",
            "Priority": 1.0
         },
         {
            "InstanceType":"c5.large",
            "SubnetId":"subnet-e7188bab",
            "Priority": 1.0
         },
         {
            "InstanceType":"c5.large",
            "SubnetId":"subnet-49e41922",
            "Priority": 1.0
         },
         {
            "InstanceType":"c5d.large",
            "SubnetId":"subnet-fae8c380",
            "Priority": 2.0
         },
         {
            "InstanceType":"c5d.large",
            "SubnetId":"subnet-e7188bab",
            "Priority": 2.0
         },
         {
            "InstanceType":"c5d.large",
            "SubnetId":"subnet-49e41922",
            "Priority": 2.0
         },
         {
            "InstanceType":"m5.large",
            "SubnetId":"subnet-fae8c380",
            "Priority": 3.0
         },
         {
            "InstanceType":"m5.large",
            "SubnetId":"subnet-e7188bab",
            "Priority": 3.0
         },
         {
            "InstanceType":"m5.large",
            "SubnetId":"subnet-49e41922",
            "Priority": 3.0
         },
         {
```

```
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-fae8c380",
                "Priority": 4.0
            },
            {
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-e7188bab",
                "Priority": 4.0
            },
            {
                "InstanceType":"m5d.large",
                "SubnetId":"subnet-49e41922",
                "Priority": 4.0
            }
         ]
      }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 12: Specify a Systems Manager parameter instead of an AMI ID

The following example uses a launch template to specify the configuration for the instances in the fleet. In this example, for `ImageId`, instead of specifying an AMI ID, the AMI is referenced with a System Manager parameter. On instance launch, the Systems Manager parameter will resolve to an AMI ID.

In this example, the Systems Manager parameter is specified in a valid format: `resolve:ssm:golden-ami`. There are other valid formats for the Systems Manager parameter. For more information, see Use a Systems Manager parameter instead of an AMI ID.

> **Note**
>
> The fleet type must be of type `instant`. Other fleet types do not support specifying a System Manager parameter instead of an AMI ID.

```
{
```

```
    "LaunchTemplateData": {
        "ImageId": "resolve:ssm:golden-ami",
        "InstanceType": "m5.4xlarge",
        "TagSpecifications": [{
            "ResourceType": "instance",
            "Tags": [{
                "Key": "Name",
                "Value": "webserver"
            }]
        }]
    }
}
```

Set a spending limit for your EC2 Fleet or Spot Fleet

You can set a limit on how much you're willing to spend per hour on your EC2 Fleet or Spot Fleet. When your spending limit is reached, the fleet stops launching instances, even if the target capacity hasn't been reached.

There are separate spending limits for On-Demand Instances and Spot Instances.

To configure a spending limit for On-Demand Instances and Spot Instances in your EC2 Fleet

Use the create-fleet command and the following parameters:

- For On-Demand Instances: In the `OnDemandOptions` structure, specify your spending limit in the `MaxTotalPrice` field.
- For Spot Instances: In the `SpotOptions` structure, specify your spending limit in the `MaxTotalPrice` field.

To configure a spending limit for On-Demand Instances and Spot Instances in your Spot Fleet

You can use the Amazon EC2 console or the AWS CLI to configure your spending limit.

(Console) When creating the Spot Fleet, select the **Set maximum cost for Spot Instances** checkbox, and then enter a value for **Set your max cost (per hour)**. For more information, see step 6.e. in Create a Spot Fleet request using defined parameters.

(AWS CLI) Use the request-spot-fleet command and the following parameters:

- For On-Demand Instances: Specify your spending limit in the `OnDemandMaxTotalPrice` field.

- For Spot Instances: Specify your spending limit in the `SpotMaxTotalPrice` field.

Examples

The following examples show two different scenarios. In the first example, the fleet stops launching On-Demand Instances when it has met the target capacity set for On-Demand Instances (`OnDemandTargetCapacity`). In the second example, the fleet stops launching On-Demand Instances when it has reached the maximum amount you're willing to pay per hour for On-Demand Instances (`MaxTotalPrice`).

Example: Stop launching On-Demand Instances when target capacity is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: $0.10 per hour
- `OnDemandTargetCapacity`: 10
- `MaxTotalPrice`: $1.50

The fleet launches 10 On-Demand Instances because the total of $1.00 (10 instances x $0.10) does not exceed the `MaxTotalPrice` of $1.50 for On-Demand Instances.

Example: Stop launching On-Demand Instances when maximum total price is reached

Given a request for `m4.large` On-Demand Instances, where:

- On-Demand Price: $0.10 per hour
- `OnDemandTargetCapacity`: 10
- `MaxTotalPrice`: $0.80

If the fleet launches the On-Demand target capacity (10 On-Demand Instances), the total cost per hour would be $1.00. This is more than the amount ($0.80) specified for `MaxTotalPrice` for On-Demand Instances. To prevent spending more than you're willing to pay, the fleet launches only 8 On-Demand Instances (below the On-Demand target capacity) because launching more would exceed the `MaxTotalPrice` for On-Demand Instances.

Burstable performance instances

If you launch your Spot Instances using a burstable performance instance type, and if you plan to use your burstable performance Spot Instances immediately and for a short duration, with no idle time for accruing CPU credits, we recommend that you launch them in Standard mode to avoid paying higher costs. If you launch burstable performance Spot Instances in Unlimited mode and burst CPU immediately, you'll spend surplus credits for bursting. If you use the instance for a short duration, the instance doesn't have time to accrue CPU credits to pay down the surplus credits, and you are charged for the surplus credits when you terminate the instance.

Unlimited mode is suitable for burstable performance Spot Instances only if the instance runs long enough to accrue CPU credits for bursting. Otherwise, paying for surplus credits makes burstable performance Spot Instances more expensive than using other instances. For more information, see When to use unlimited mode versus fixed CPU.

Launch credits are meant to provide a productive initial launch experience for T2 instances by providing sufficient compute resources to configure the instance. Repeated launches of T2 instances to access new launch credits is not permitted. If you require sustained CPU, you can earn credits (by idling over some period), use Unlimited mode for T2 Spot Instances, or use an instance type with dedicated CPU.

Specify attributes for instance type selection for EC2 Fleet or Spot Fleet

When you create an EC2 Fleet or Spot Fleet, you must specify one or more instance types for configuring the On-Demand Instances and Spot Instances in the fleet. As an alternative to manually specifying the instance types, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. This is known as *attribute-based instance type selection*. For example, you can specify the minimum and maximum number of vCPUs required for your instances, and the fleet will launch the instances using any available instance types that meet those vCPU requirements.

Attribute-based instance type selection is ideal for workloads and frameworks that can be flexible about what instance types they use, such as when running containers or web fleets, processing big data, and implementing continuous integration and deployment (CI/CD) tooling.

Benefits

Attribute-based instance type selection has the following benefits:

- **Easily use the right instance types** – With so many instance types available, finding the right instance types for your workload can be time consuming. When you specify instance attributes, the instance types will automatically have the required attributes for your workload.
- **Simplified configuration** – To manually specify multiple instance types for a fleet, you must create a separate launch template override for each instance type. But with attribute-based instance type selection, to provide multiple instance types, you need only specify the instance attributes in the launch template or in a launch template override.
- **Automatic use of new instance types** – When you specify instance attributes rather than instance types, your fleet can use newer generation instance types as they're released, "future proofing" the fleet's configuration.
- **Instance type flexibility** – When you specify instance attributes rather than instance types, the fleet can select from a wide range of instance types for launching Spot Instances, which adheres to the Spot best practice of instance type flexibility.

Topics

- How attribute-based instance type selection works
- Price protection
- Performance protection
- Considerations
- Create an EC2 Fleet with attribute-based instance type selection
- Create a Spot Fleet with attribute-based instance type selection
- Examples of EC2 Fleet configurations that are valid and not valid
- Examples of Spot Fleet configurations that are valid and not valid
- Preview instance types with specified attributes

How attribute-based instance type selection works

To use attribute-based instance type selection in your fleet configuration, you replace the list of instance types with a list of instance attributes that your instances require. EC2 Fleet or Spot Fleet will launch instances on any available instance types that have the specified instance attributes.

Topics

- Types of instance attributes
- Where to configure attribute-based instance type selection

- How EC2 Fleet or Spot Fleet uses attribute-based instance type selection when provisioning a fleet

Types of instance attributes

There are several instance attributes that you can specify to express your compute requirements, such as:

- **vCPU count** – The minimum and maximum number of vCPUs per instance.
- **Memory** – The minimum and maximum GiBs of memory per instance.
- **Local storage** – Whether to use EBS or instance store volumes for local storage.
- **Burstable performance** – Whether to use the T instance family, including T4g, T3a, T3, and T2 types.

For a description of each attribute and the default values, see InstanceRequirements in the *Amazon EC2 API Reference*.

Where to configure attribute-based instance type selection

Depending on whether you use the console or the AWS CLI, you can specify the instance attributes for attribute-based instance type selection as follows:

In the console, you can specify the instance attributes in the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- (Spot Fleet only) In the fleet request

In the AWS CLI, you can specify the instance attributes in one or all of the following fleet configuration components:

- In a launch template, and then reference the launch template in the fleet request
- In a launch template override

  If you want a mix of instances that use different AMIs, you can specify instance attributes in multiple launch template overrides. For example, different instance types can use x86 and Arm-based processors.

- (Spot Fleet only) In a launch specification

How EC2 Fleet or Spot Fleet uses attribute-based instance type selection when provisioning a fleet

EC2 Fleet or Spot Fleet provisions a fleet in the following way:

- It identifies the instance types that have the specified attributes.
- It uses price protection to determine which instance types to exclude.
- It determines the capacity pools from which it will consider launching the instances based on the AWS Regions or Availability Zones that have matching instance types.
- It applies the specified allocation strategy to determine from which capacity pools to launch the instances.

  Note that attribute-based instance type selection does not pick the capacity pools from which to provision the fleet; that's the job of the allocation strategies.

  If you specify an allocation strategy, the fleet will launch instances according to the specified allocation strategy.

  - For Spot Instances, attribute-based instance type selection supports the **price capacity optimized**, **capacity optimized**, and **lowest price** allocation strategies. Note that we don't recommend the **lowest price** Spot allocation strategy because it has the highest risk of interruption for your Spot Instances.
  - For On-Demand Instances, attribute-based instance type selection supports the **lowest price** allocation strategy.
- If there is no capacity for the instance types with the specified instance attributes, no instances can be launched, and the fleet returns an error.

Price protection

Price protection is a feature that prevents your EC2 Fleet or Spot Fleet from using instance types that you would consider too expensive even if they happen to fit the attributes that you specified. To use price protection, you set a price threshold. Then, when Amazon EC2 selects instance types with your attributes, it excludes instance types priced above your threshold.

The way that Amazon EC2 calculates the price threshold is as follows:

- Amazon EC2 first identifies the lowest priced instance type from those that match your attributes.
- Amazon EC2 then takes the value (expressed as a percentage) that you specified for the price protection parameter and multiplies it with the price of the identified instance type. The result is the price that is used as the price threshold.

There are separate price thresholds for On-Demand Instances and Spot Instances.

When you create a fleet with attribute-based instance type selection, price protection is enabled by default. You can keep the default values, or you can specify your own.

You can also turn off price protection. To indicate no price protection threshold, specify a high percentage value, such as 999999.

Topics

- How the lowest priced instance type is identified
- On-Demand Instance price protection
- Spot Instance price protection
- Specify the price protection threshold

How the lowest priced instance type is identified

Amazon EC2 determines the price to base the price threshold on by identifying the instance type with the lowest price from those that match your specified attributes. It does this in the following way:

- It first looks at the current generation C, M, or R instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any current generation instance types that match your attributes. If it finds any matches, it identifies the lowest priced instance type.
- If there is no match, it then looks at any previous generation instance types that match your attributes, and identifies the lowest priced instance type.

On-Demand Instance price protection

The price protection threshold for On-Demand instance types is calculated *as a percentage higher* than the identified lowest priced On-Demand instance type

(OnDemandMaxPricePercentageOverLowestPrice). You specify the percentage higher that you're willing to pay. If you don't specify this parameter, then a default value of 20 is used to calculate a price protection threshold of 20% higher than the identified price.

For example, if the identified On-Demand instance price is 0.4271, and you specify 25, then the price threshold is 25% more than 0.4271. It is calculated as follows: 0.4271 * 1.25 = 0.533875. The calculated price is the maximum you're willing to pay for On-Demand Instances, and, in this example, Amazon EC2 will exclude any On-Demand instance types that cost more than 0.533875.

Spot Instance price protection

By default, Amazon EC2 will automatically apply optimal Spot Instance price protection to consistently select from a wide range of instance types. You can also manually set the price protection yourself. However, letting Amazon EC2 do it for you can improve the likelihood that your Spot capacity is fulfilled.

You can manually specify the price protection using one of the following options. If you manually set the price protection, we recommend using the first option.

- **A *percentage of* the identified lowest priced *On-Demand* instance type** [MaxSpotPriceAsPercentageOfOptimalOnDemandPrice]

  For example, if the identified On-Demand instance type price is 0.4271, and you specify 60, then the price threshold is 60% of 0.4271. It is calculated as follows: 0.4271 * 0.60 = 0.25626. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.25626.

- **A *percentage higher than* the identified lowest priced *Spot* instance type** [SpotMaxPricePercentageOverLowestPrice]

  For example, if the identified Spot instance type price is 0.1808, and you specify 25, then the price threshold is 25% more than 0.1808. It is calculated as follows: 0.1808 * 1.25 = 0.226. The calculated price is the maximum you're willing to pay for Spot Instances, and, in this example, Amazon EC2 will exclude any Spot instance types that cost more than 0.266. We do not recommend using this parameter because Spot prices can fluctuate, and therefore your price protection threshold might also fluctuate.

Specify the price protection threshold

To specify the price protection threshold using the AWS CLI

While creating an EC2 Fleet or Spot Fleet using the AWS CLI, configure the fleet for attribute-based instance type selection, and then do the following:

- To specify the On-Demand Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, for `OnDemandMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.
- To specify the Spot Instance price protection threshold, in the JSON configuration file, in the `InstanceRequirements` structure, specify *one* of the following parameters:
  - For `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice`, enter the price protection threshold as a percentage.
  - For `SpotMaxPricePercentageOverLowestPrice`, enter the price protection threshold as a percentage.

For more information, see Create an EC2 Fleet with attribute-based instance type selection or Create a Spot Fleet with attribute-based instance type selection.

(Spot Fleet only) To specify the price protection threshold using the console

While creating a Spot Fleet in the console, configure the fleet for attribute-based instance type selection, and then do the following:

- To specify the On-Demand Instance price protection threshold, under **Additional instance attribute**, choose **On-demand price protection**, choose **Add attribute**, and then enter the price protection threshold as a percentage.
- To specify the Spot Instance price protection threshold, **Additional instance attribute**, choose **Spot price protection**, choose **Add attribute**, choose a base value on which to base your price, and then enter the price protection threshold as a percentage.

Note

When creating the fleet, if you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Performance protection

Performance protection is a feature that ensures your EC2 Fleet or Spot Fleet uses instance types that are similar to or exceed a specified performance baseline. To use performance protection, you specify an instance family as a baseline reference. The capabilities of the specified instance family establish the lowest acceptable level of performance. When Amazon EC2 selects instance types for your fleet, it considers your specified attributes and the performance baseline. Instance types that fall below the performance baseline are automatically excluded from selection, even if they match your other specified attributes. This ensures that all selected instance types offer performance similar to or better than the baseline established by the specified instance family. Amazon EC2 uses this baseline to guide instance type selection, but there is no guarantee that the selected instance types will always exceed the baseline for every application.

Currently, this feature only supports CPU performance as a baseline performance factor. The CPU performance of the specified instance family's CPU processor serves as the performance baseline, ensuring that selected instance types are similar to or exceed this baseline. Instance families with the same CPU processors lead to the same filtering results, even if their network or disk performance differs. For example, specifying either `c6in` or `c6i` as the baseline reference would produce identical performance-based filtering results because both instance families use the same CPU processor.

Unsupported instance families

The following instance families are **not** supported for performance protection:

- **General purpose:** Mac1 | Mac2 | Mac2-m1ultra | Mac2-m2 | Mac2-m2pro | M1 | M2 | T1
- **Compute optimized:** C1
- **Memory optimized:** U-3tb1 | U-6tb1 | U-9tb1 | U-12tb1 | U-18tb1 | u-24tb1 | U7i-12tb | U7in-16tb | U7in-24tb | U7in-32tb
- **Accelerated computing:** G3 | G3s | P3dn | P4d | P5
- **High-performance computing:** Hpc7g

If you enable performance protection by specifying a supported instance family, the returned instance types will exclude the above unsupported instance families.

If you specify an unsupported instance family as a value for baseline performance, the API returns an empty response for GetInstanceTypesFromInstanceRequirements and an exception for CreateFleet, RequestSpotFleet, ModifyFleet, and ModifySpotFleetRequest.

Example: Set a CPU performance baseline

In the following example, the instance requirement is to launch with instance types that have CPU cores that are as performant as the `c6i` instance family. This will filter out instance types with less performant CPU processors, even if they meet your other specified instance requirements such as the number of vCPUs. For example, if your specified instance attributes include 4 vCPUs and 16 GB of memory, an instance type with these attributes but with lower CPU performance than `c6i` will be excluded from selection.

```
"BaselinePerformanceFactors": {
        "Cpu": {
            "References": [
                {
                    "InstanceFamily": "c6i"
                }
            ]
        }
```

Considerations

- You can specify either instance types or instance attributes in an EC2 Fleet or Spot Fleet, but not both at the same time.

  When using the CLI, the launch template overrides will override the launch template. For example, if the launch template contains an instance type and the launch template override contains instance attributes, the instances that are identified by the instance attributes will override the instance type in the launch template.
- When using the CLI, when you specify instance attributes as overrides, you can't also specify weights or priorities.
- You can specify a maximum of four `InstanceRequirements` structures in a request configuration.

Create an EC2 Fleet with attribute-based instance type selection

You can configure an EC2 Fleet to use attribute-based instance type selection. It is not possible to create an EC2 Fleet using the Amazon EC2 console.

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they can't determine the fleet configuration at the same time as instance attributes.

In the AWS CLI and PowerShell examples, the following attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs and a maximum of 4 vCPUs. If you don't need a maximum limit, you can omit the maximum value.
- `MemoryMiB` – A minimum of 8 GiB of memory and a maximum of 16 GiB. If you don't need a maximum limit, you can omit the maximum value.

This configuration identifies any instance types with 2 to 4 vCPUs and 8 to 16 GiB of memory. However, price protection and the allocation strategy might exclude some instance types when EC2 Fleet provisions the fleet.

AWS CLI

To create an EC2 Fleet with attribute-based instance type selection

Use the create-fleet command to create an EC2 Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 create-fleet \
    --region us-east-1 \
    --cli-input-json file://file_name.json
```

The following example *file_name*`.json` file contains the parameters that configure an EC2 Fleet to use attribute-based instance type selection.

```
{
    "SpotOptions": {
        "AllocationStrategy": "price-capacity-optimized"
    },
    "LaunchTemplateConfigs": [{
```

```
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
        },
        "Overrides": [{
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 2,
                    "Max": 4
                },
                "MemoryMiB": {
                    "Min": 8192,
                    "Max": 16384
                }
            }
        }]
    }],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

PowerShell

To create an EC2 Fleet with attribute-based instance type selection

Use the New-EC2Fleet cmdlet.

```
$vcpuCount = New-Object Amazon.EC2.Model.VCpuCountRangeRequest
$vcpuCount.Min = 2
$vcpuCount.Max = 4
$memoryMiB = New-Object Amazon.EC2.Model.MemoryMiBRequest
$memoryMiB.Min = 8192
$memoryMiB.Max = 16384
$instanceRequirements = New-Object Amazon.EC2.Model.InstanceRequirementsRequest
$instanceRequirements.VCpuCount = $vcpuCount
$instanceRequirements.MemoryMiB = $memoryMiB

$launchTemplateSpec = New-Object
 Amazon.EC2.Model.FleetLaunchTemplateSpecificationRequest
$launchTemplateSpec.LaunchTemplateName = "my-launch-template"
$launchTemplateSpec.Version = "1"
```

```
$override = New-Object Amazon.EC2.Model.FleetLaunchTemplateOverridesRequest
$override.InstanceRequirements = $instanceRequirements
$launchTemplateConfig = New-Object Amazon.EC2.Model.FleetLaunchTemplateConfigRequest
$launchTemplateConfig.LaunchTemplateSpecification = $launchTemplateSpec
$launchTemplateConfig.Overrides = @($override)

New-EC2Fleet `
    -SpotOptions_AllocationStrategy "price-capacity-optimized" `
    -LaunchTemplateConfig @($launchTemplateConfig) `
    -TargetCapacitySpecification_DefaultTargetCapacityType "spot" `
    -TargetCapacitySpecification_TotalTargetCapacity 20 `
    -Type "instant"
```

Create a Spot Fleet with attribute-based instance type selection

> **Important**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

You can configure a fleet to use attribute-based instance type selection.

The attributes for attribute-based instance type selection are specified in the `InstanceRequirements` structure. When `InstanceRequirements` is included in the fleet configuration, `InstanceType` and `WeightedCapacity` must be excluded; they can't determine the fleet configuration at the same time as instance attributes.

In the AWS CLI and PowerShell examples, the following attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs and a maximum of 4 vCPUs. If you don't need a maximum limit, you can omit the maximum value.
- `MemoryMiB` – A minimum of 8 GiB of memory and a maximum of 16 GiB. If you don't need a maximum limit, you can omit the maximum value.

This configuration identifies any instance types that have 2 to 4 vCPUs and 8 to 16 GiB of memory. However, price protection and the allocation strategy might exclude some instance types when Spot Fleet provisions the fleet.

Console

To configure a Spot Fleet for attribute-based instance type selection

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**, and then choose **Request Spot Instances**.
3. Follow the steps to create a Spot Fleet. For more information, see Create a Spot Fleet request using defined parameters.

   While creating the Spot Fleet, configure the fleet for attribute-based instance type selection as follows:

   a. For **Instance type requirements**, choose **Specify instance attributes that match your compute requirements**.

   b. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum**, **No maximum**, or both.

   c. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum**, **No maximum**, or both.

   d. (Optional) For **Additional instance attributes**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds further constraints to your request.

   e. (Optional) Expand **Preview matching instance types** to view the instance types that have your specified attributes.

AWS CLI

To configure a Spot Fleet for attribute-based instance type selection

Use the request-spot-fleet command to create a Spot Fleet. Specify the fleet configuration in a JSON file.

```
aws ec2 request-spot-fleet \
    --region us-east-1 \
    --spot-fleet-request-config file://file_name.json
```

The following example *file_name*.json file contains the parameters that configure a Spot Fleet to use attribute-based instance type selection.

```
{
    "AllocationStrategy": "priceCapacityOptimized",
    "TargetCapacity": 20,
    "Type": "request",
    "LaunchTemplateConfigs": [{
        "LaunchTemplateSpecification": {
            "LaunchTemplateName": "my-launch-template",
            "Version": "1"
        },
        "Overrides": [{
            "InstanceRequirements": {
                "VCpuCount": {
                    "Min": 2,
                    "Max": 4
                },
                "MemoryMiB": {
                    "Min": 8192,
                    "Max": 16384
                }
            }
        }]
    }]
}
```

PowerShell

To configure a Spot Fleet for attribute-based instance type selection

Use the Request-EC2SpotFleet cmdlet.

```
$vcpuCount = New-Object Amazon.EC2.Model.VCpuCountRange
$vcpuCount.Min = 2
$vcpuCount.Max = 4
$memoryMiB = New-Object Amazon.EC2.Model.MemoryMiB
$memoryMiB.Min = 8192
$memoryMiB.Max = 16384
$instanceRequirements = New-Object Amazon.EC2.Model.InstanceRequirements
$instanceRequirements.VCpuCount = $vcpuCount
$instanceRequirements.MemoryMiB = $memoryMiB

$launchTemplateSpec = New-Object Amazon.EC2.Model.FleetLaunchTemplateSpecification
$launchTemplateSpec.LaunchTemplateName = "my-launch-template"
$launchTemplateSpec.Version = "1"
```

```
$override = New-Object Amazon.EC2.Model.LaunchTemplateOverrides
$override.InstanceRequirements = $instanceRequirements
$launchTemplateConfig = New-Object Amazon.EC2.Model.LaunchTemplateConfig
$launchTemplateConfig.LaunchTemplateSpecification = $launchTemplateSpec
$launchTemplateConfig.Overrides = @($override)

Request-EC2SpotFleet `
    -SpotFleetRequestConfig_AllocationStrategy "PriceCapacityOptimized" `
    -SpotFleetRequestConfig_TargetCapacity 20 `
    -SpotFleetRequestConfig_Type "Request" `
    -SpotFleetRequestConfig_LaunchTemplateConfig $launchTemplateConfig
```

Examples of EC2 Fleet configurations that are valid and not valid

If you use the AWS CLI to create an EC2 Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- Valid configuration: Single launch template with overrides
- Valid configuration: Single launch template with multiple InstanceRequirements
- Valid configuration: Two launch templates, each with overrides
- Valid configuration: Only InstanceRequirements specified, no overlapping attribute values
- Configuration not valid: Overrides contain InstanceRequirements and InstanceType
- Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType
- Configuration not valid: Overlapping attribute values

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one `Overrides` structure containing one `InstanceRequirements` structure. A text explanation of the example configuration follows.

```
{
        "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "My-launch-template",
                "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 2,
                            "Max": 8
                        },
                        "MemoryMib": {
                            "Min": 0,
                            "Max": 10240
                        },
                        "MemoryGiBPerVCpu": {
                            "Max": 10000
                        },
                        "RequireHibernateSupport": true
                    }
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 5000,
        "DefaultTargetCapacityType": "spot",
        "TargetCapacityUnitType": "vcpu"
        }
    }
}
```

`InstanceRequirements`

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

`TargetCapacityUnitType`

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is `5000` and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. EC2 Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
```

```
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 4,
                            "Max": 8
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one `Overrides` structure containing one `InstanceRequirements` structure. This configuration is useful for `arm` and x86 architecture support in the same fleet.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "armLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
```

```
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "x86LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            }
        ],
         "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Valid configuration: Only `InstanceRequirements` specified, no overlapping attribute values

The following configuration is valid. It contains two `LaunchTemplateSpecification` structures, each with a launch template and an `Overrides` structure containing an `InstanceRequirements` structure. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 4,
                            "Max": 8
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
```

```
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Configuration not valid: `Overrides` contain `InstanceRequirements` and `InstanceType`

The following configuration is not valid. The `Overrides` structure contains both `InstanceRequirements` and `InstanceType`. For the `Overrides`, you can specify either `InstanceRequirements` or `InstanceType`, but not both.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                    "InstanceType": "m5.large"
                }
              ]
            }
        ],
        "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Configuration not valid: Two `Overrides` contain `InstanceRequirements` and `InstanceType`

The following configuration is not valid. The `Overrides` structures contain both `InstanceRequirements` and `InstanceType`. You can specify either `InstanceRequirements` or `InstanceType`, but not both, even if they're in different `Overrides` structures.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceType": "m5.large"
                }
              ]
            }
        ],
         "TargetCapacitySpecification": {
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
```

```
    }
}
```

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two `InstanceRequirements` structures each contain `"VCpuCount": {"Min": 0, "Max": 2}`. The values for these attributes overlap, which will result in duplicate capacity pools.

```
{
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    },
                    {
                      "InstanceRequirements": {
                          "VCpuCount": {
                              "Min": 0,
                              "Max": 2
                          },
                          "MemoryMiB": {
                              "Min": 0
                          }
                      }
                  }
                }
              ]
            }
        ],
         "TargetCapacitySpecification": {
```

```
            "TotalTargetCapacity": 1,
            "DefaultTargetCapacityType": "spot"
        }
    }
}
```

Examples of Spot Fleet configurations that are valid and not valid

If you use the AWS CLI to create a Spot Fleet, you must make sure that your fleet configuration is valid. The following examples show configurations that are valid and not valid.

Configurations are considered not valid when they contain the following:

- A single `Overrides` structure with both `InstanceRequirements` and `InstanceType`
- Two `Overrides` structures, one with `InstanceRequirements` and the other with `InstanceType`
- Two `InstanceRequirements` structures with overlapping attribute values within the same `LaunchTemplateSpecification`

Example configurations

- Valid configuration: Single launch template with overrides
- Valid configuration: Single launch template with multiple InstanceRequirements
- Valid configuration: Two launch templates, each with overrides
- Valid configuration: Only InstanceRequirements specified, no overlapping attribute values
- Configuration not valid: Overrides contain InstanceRequirements and InstanceType
- Configuration not valid: Two Overrides contain InstanceRequirements and InstanceType
- Configuration not valid: Overlapping attribute values

Valid configuration: Single launch template with overrides

The following configuration is valid. It contains one launch template and one `Overrides` structure containing one `InstanceRequirements` structure. A text explanation of the example configuration follows.

```
{
    "SpotFleetRequestConfig": {
```

```
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "My-launch-template",
                "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 2,
                            "Max": 8
                        },
                        "MemoryMib": {
                            "Min": 0,
                            "Max": 10240
                        },
                        "MemoryGiBPerVCpu": {
                            "Max": 10000
                        },
                        "RequireHibernateSupport": true
                    }
                }
            ]
        }
    ],
        "TargetCapacity": 5000,
            "OnDemandTargetCapacity": 0,
            "TargetCapacityUnitType": "vcpu"
    }
}
```

`InstanceRequirements`

To use attribute-based instance selection, you must include the `InstanceRequirements` structure in your fleet configuration, and specify the desired attributes for the instances in the fleet.

In the preceding example, the following instance attributes are specified:

- `VCpuCount` – The instance types must have a minimum of 2 and a maximum of 8 vCPUs.
- `MemoryMiB` – The instance types must have a maximum of 10240 MiB of memory. A minimum of 0 indicates no minimum limit.
- `MemoryGiBPerVCpu` – The instance types must have a maximum of 10,000 GiB of memory per vCPU. The `Min` parameter is optional. By omitting it, you indicate no minimum limit.

`TargetCapacityUnitType`

The `TargetCapacityUnitType` parameter specifies the unit for the target capacity. In the example, the target capacity is `5000` and the target capacity unit type is `vcpu`, which together specify a desired target capacity of 5,000 vCPUs. Spot Fleet will launch enough instances so that the total number of vCPUs in the fleet is 5,000 vCPUs.

Valid configuration: Single launch template with multiple InstanceRequirements

The following configuration is valid. It contains one launch template and one `Overrides` structure containing two `InstanceRequirements` structures. The attributes specified in `InstanceRequirements` are valid because the values do not overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
```

```
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 4,
                            "Max": 8
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Valid configuration: Two launch templates, each with overrides

The following configuration is valid. It contains two launch templates, each with one `Overrides` structure containing one `InstanceRequirements` structure. This configuration is useful for `arm` and x86 architecture support in the same fleet.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "armLaunchTemplate",
                    "Version": "1"
                },
```

```
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "x86LaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Valid configuration: Only `InstanceRequirements` specified, no overlapping attribute values

The following configuration is valid. It contains two `LaunchTemplateSpecification` structures, each with a launch template and an `Overrides` structure containing an `InstanceRequirements` structure. The attributes specified in `InstanceRequirements` are valid because the values do not

overlap—the first `InstanceRequirements` structure specifies a `VCpuCount` of 0-2 vCPUs, while the second `InstanceRequirements` structure specifies 4-8 vCPUs.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            },
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 4,
                            "Max": 8
                        },
                        "MemoryMiB": {
                            "Min": 0
```

```
                        }
                    }
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Configuration not valid: `Overrides` contain `InstanceRequirements` and `InstanceType`

The following configuration is not valid. The `Overrides` structure contains both `InstanceRequirements` and `InstanceType`. For the `Overrides`, you can specify either `InstanceRequirements` or `InstanceType`, but not both.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                },
                {
```

```
                    "InstanceType": "m5.large"
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Configuration not valid: Two `Overrides` contain `InstanceRequirements` and `InstanceType`

The following configuration is not valid. The `Overrides` structures contain both `InstanceRequirements` and `InstanceType`. You can specify either `InstanceRequirements` or `InstanceType`, but not both, even if they're in different `Overrides` structures.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
                        "MemoryMiB": {
                            "Min": 0
                        }
                    }
                }
              ]
            },
```

```
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyOtherLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceType": "m5.large"
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Configuration not valid: Overlapping attribute values

The following configuration is not valid. The two `InstanceRequirements` structures each contain `"VCpuCount": {"Min": 0, "Max": 2}`. The values for these attributes overlap, which will result in duplicate capacity pools.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "MyLaunchTemplate",
                    "Version": "1"
                },
                "Overrides": [
                {
                    "InstanceRequirements": {
                        "VCpuCount": {
                            "Min": 0,
                            "Max": 2
                        },
```

```
                        "MemoryMiB": {
                            "Min": 0
                        }
                    },
                    {
                      "InstanceRequirements": {
                          "VCpuCount": {
                              "Min": 0,
                              "Max": 2
                          },
                          "MemoryMiB": {
                              "Min": 0
                          }
                      }
                  }
                }
              ]
            }
        ],
        "TargetCapacity": 1,
        "OnDemandTargetCapacity": 0,
        "Type": "maintain"
    }
}
```

Preview instance types with specified attributes

You can use the get-instance-types-from-instance-requirements command to preview the instance types that match the attributes that you specify. This is especially useful for working out what attributes to specify in your request configuration without launching any instances. Note that the command does not consider available capacity.

To preview a list of instance types by specifying attributes using the AWS CLI

1. (Optional) To generate all of the possible attributes that can be specified, use the get-instance-types-from-instance-requirements command and the `--generate-cli-skeleton` parameter. You can optionally direct the output to a file to save it by using `input > attributes.json`.

```
aws ec2 get-instance-types-from-instance-requirements \
    --region us-east-1 \
```

```
    --generate-cli-skeleton input > attributes.json
```

Expected output

```
{
    "DryRun": true,
    "ArchitectureTypes": [
        "i386"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 0,
            "Max": 0
        },

            ""
        ]
    },
    "MaxResults": 0,
    "NextToken": ""
}
```

2. Create a JSON configuration file using the output from the previous step, and configure it as follows:

> **Note**
>
> You must provide values for `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. You can omit the other attributes; when omitted, the default values are used.
> For a description of each attribute and their default values, see get-instance-types-from-instance-requirements.

a. For `ArchitectureTypes`, specify one or more types of processor architecture.

b. For `VirtualizationTypes`, specify one or more types of virtualization.

c. For `VCpuCount`, specify the minimum and maximum number of vCPUs. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.

d. For `MemoryMiB`, specify the minimum and maximum amount of memory in MiB. To specify no minimum limit, for `Min`, specify `0`. To specify no maximum limit, omit the `Max` parameter.

e. You can optionally specify one or more of the other attributes to further constrain the list of instance types that are returned.

3. To preview the instance types that have the attributes that you specified in the JSON file, use the get-instance-types-from-instance-requirements command, and specify the name and path to your JSON file by using the `--cli-input-json` parameter. You can optionally format the output to appear in a table format.

```
aws ec2 get-instance-types-from-instance-requirements \
    --cli-input-json file://attributes.json \
    --output table
```

Example *attributes.json* file

In this example, the required attributes are included in the JSON file. They are `ArchitectureTypes`, `VirtualizationTypes`, `VCpuCount`, and `MemoryMiB`. In addition, the optional `InstanceGenerations` attribute is also included. Note that for `MemoryMiB`, the `Max` value can be omitted to indicate that there is no limit.

```
{
```

```
    "ArchitectureTypes": [
        "x86_64"
    ],
    "VirtualizationTypes": [
        "hvm"
    ],
    "InstanceRequirements": {
        "VCpuCount": {
            "Min": 4,
            "Max": 6
        },
        "MemoryMiB": {
            "Min": 2048
        },
        "InstanceGenerations": [
            "current"
        ]
    }
}
```

Example output

```
-----------------------------------------
|GetInstanceTypesFromInstanceRequirements|
+---------------------------------------+
||             InstanceTypes             ||
|+-------------------------------------+|
||             InstanceType              ||
|+-------------------------------------+|
||  c4.xlarge                          ||
||  c5.xlarge                          ||
||  c5a.xlarge                         ||
||  c5ad.xlarge                        ||
||  c5d.xlarge                         ||
||  c5n.xlarge                         ||
||  d2.xlarge                          ||
...
```

4. After identifying instance types that meet your needs, make note of the instance attributes that you used so that you can use them when configuring your fleet request.

Use instance weighting to manage cost and performance of your EC2 Fleet or Spot Fleet

With instance weighting, you assign a weight to each instance type in your EC2 Fleet or Spot Fleet to represent their compute capacity and performance relative to each other. Based on the weights, the fleet can use any combination of the specified instance types, as long as it can fulfil the desired target capacity. This can help you manage the cost and performance of your fleet.

The weight represents the capacity units that an instance type contributes to the total target capacity.

Example: Use instance weighting for performance management

Suppose your fleet has two instance types, and you assign a different weight to each instance type to reflect how many you need of each to achieve the same performance, as follows:

- `m5.large` – weight: 1
- `m5.2xlarge` – weight: 4

By assigning these weights, you're saying that you'd need 4 `m5.large` instances to achieve the same performance as 1 `m5.2xlarge`.

To calculate how many instances of each instance type are needed for a given target capacity, use the following formula:

```
target capacity / weight = number of instances
```

If your target capacity is 8 units, the fleet could fulfill the target capacity with either `m5.large` or `m5.2xlarge`, or a mix of both, as follows:

- 8 `m5.large` instances (capacity of 8 / weight of 1 = 8 instances)
- 2 `m5.2xlarge` instances (capacity of 8 / weight of 4 = 2 instances)
- 4 `m5.large` and 1 `m5.2xlarge`

Example: Use instance weighting for cost management

By default, the price that you specify is per *instance* hour. When you use the instance weighting feature, the price that you specify is per *unit* hour. You can calculate your price per unit hour by dividing your price for an instance type by the number of units that it represents. The fleet

calculates the number of instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity. The fleet can select any pool that you specify in your launch specification, even if the capacity of the instances launched exceeds the requested target capacity.

The following table includes examples of calculations to determine the price per unit for a fleet with a target capacity of 10.

Instance type	Instance weight	Target capacity	Number of instances launched	Price per instance hour	Price per unit hour
`r3.xlarge`	2	10	5 (10 divided by 2)	$0.05	$0.025 (.05 divided by 2)
`r3.8xlarge`	8	10	2 (10 divided by 8, result rounded up)	$0.10	$0.0125 (.10 divided by 8)

Use the fleet instance weighting as follows to provision the target capacity that you want in the pools with the lowest price per unit at the time of fulfillment:

1. Set the target capacity for your fleet either in instances (the default) or in the units of your choice, such as vCPU, memory, storage, or throughput.
2. Set the price per unit.
3. For each launch specification, specify the weight, which is the number of units that the instance type represents toward the target capacity.

Instance weighting example

Consider a fleet request with the following configuration:

- A target capacity of 24

- A launch specification with an instance type `r3.2xlarge` and a weight of 6
- A launch specification with an instance type `c3.xlarge` and a weight of 5

The weights represent the number of units that instance type represents toward the target capacity. If the first launch specification provides the lowest price per unit (price for `r3.2xlarge` per instance hour divided by 6), the fleet would launch four of these instances (24 divided by 6).

If the second launch specification provides the lowest price per unit (price for `c3.xlarge` per instance hour divided by 5), the fleet would launch five of these instances (24 divided by 5, result rounded up).

Instance weighting and allocation strategy

Consider a fleet request with the following configuration:

- A target capacity of 30 Spot Instances
- A launch specification with an instance type `c3.2xlarge` and a weight of 8
- A launch specification with an instance type `m3.xlarge` and a weight of 8
- A launch specification with an instance type `r3.xlarge` and a weight of 8

The fleet would launch four instances (30 divided by 8, result rounded up). With the `diversified` strategy, the fleet launches one instance in each of the three pools, and the fourth instance in whichever of the three pools provides the lowest price per unit.

Use allocation strategies to determine how EC2 Fleet or Spot Fleet fulfills Spot and On-Demand capacity

When you use multiple capacity pools (each comprising an instance type and Availability Zone) in an EC2 Fleet or Spot Fleet, you can use an *allocation strategy* to manage how Amazon EC2 fulfills your Spot and On-Demand capacities from these pools. The allocation strategies can optimize for available capacity, price, and the instance types to use. There are different allocation strategies for Spot Instances and On-Demand Instances.

Topics

- Allocation strategies for Spot Instances
- Allocation strategies for On-Demand Instances
- Choose the appropriate Spot allocation strategy

- Maintain target capacity for Spot Instances
- Prioritize instance types for On-Demand capacity

Allocation strategies for Spot Instances

Your launch configuration determines all the possible Spot capacity pools (instance types and Availability Zones) from which EC2 Fleet or Spot Fleet can launch Spot Instances. However, when launching instances, the fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

> **Note**
>
> (Linux instances only) If you configure your Spot Instance to launch with AMD SEV-SNP turned on, you are charged an additional hourly usage fee that is equivalent to 10% of the On-Demand hourly rate for the selected instance type. If the allocation strategy uses price as an input, the fleet does not include this additional fee; only the Spot price is used.

You can specify one of the following allocation strategies for Spot Instances:

Price capacity optimized (recommended)

The fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that Spot Instances are requested from the pools that are most likely to have the lowest chance of interruption in the near term. The fleet then requests Spot Instances from the lowest priced of these pools.

The **price capacity optimized** allocation strategy is the best choice for most Spot workloads, such as stateless containerized applications, microservices, web applications, data and analytics jobs, and batch processing.

If you're using the AWS CLI, the parameter name is `price-capacity-optimized` for EC2 Fleet and `priceCapacityOptimized` for Spot Fleet.

Capacity optimized

The fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that Spot Instances are requested from the pools that are most likely to have the lowest chance of interruption in the near term.

With Spot Instances, pricing changes slowly over time based on long-term trends in supply and demand, but capacity fluctuates in real time. The **capacity optimized** strategy automatically launches Spot Instances into the most available pools by looking at real-time capacity data and predicting which are the most available. This works well for workloads that may have a higher cost of interruption associated with restarting work, such as long Continuous Integration (CI), image and media rendering, Deep Learning, and High Performance Compute (HPC) workloads that may have a higher cost of interruption associated with restarting work. By offering the possibility of fewer interruptions, the **capacity optimized** strategy can lower the overall cost of your workload.

Alternatively, you can use the **capacity optimized prioritized** allocation strategy with a priority parameter to order instance types from highest to lowest priority. You can set the same priority for different instance types. The fleet will optimize for capacity first, but will honor instance type priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect the fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters. Note that when you set the priority for instance types for your Spot capacity, the same priority is also applied to your On-Demand Instances if the On-Demand allocation strategy is set to **prioritized**. For Spot Fleet, using priorities is supported only if your fleet uses a launch template.

If you're using the AWS CLI, the parameter names are `capacity-optimized` and `capacity-optimized-prioritized` for EC2 Fleet and `capacityOptimized` and `capacityOptimizedPrioritized` for Spot Fleet.

Diversified

The Spot Instances are distributed across all Spot capacity pools. If you're using the AWS CLI, the parameter name is `diversified` for both EC2 Fleet and Spot Fleet.

Lowest price (not recommended)

> **Warning**
>
> We don't recommend the **lowest price** allocation strategy because it has the highest risk of interruption for your Spot Instances.

The Spot Instances come from the lowest priced pool that has available capacity. When using the AWS CLI, this is the default strategy. However, we recommend that you override the default by specifying the **price capacity optimized** allocation strategy.

With the lowest price strategy, if the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity. If a pool runs out of capacity before fulfilling your desired capacity, the fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools.

Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

The lowest price allocation strategy is only available when using the AWS CLI. The parameter name is `lowest-price` for EC2 Fleet and `lowestPrice` for Spot Fleet.

Number of pools to use

The number of Spot pools across which to allocate your target Spot capacity. Valid only when the allocation strategy is set to **lowest price**. The fleet selects the lowest priced Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that the fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, the fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

This parameter is only available when specifying the **lowest price** allocation strategy and only when using the AWS CLI. The parameter name is `InstancePoolsToUseCount` for both EC2 Fleet and Spot Fleet.

Allocation strategies for On-Demand Instances

Your launch configuration determines all the possible capacity pools (instance types and Availability Zones) from which EC2 Fleet or Spot Fleet can launch On-Demand Instances. However, when launching instances, the fleet uses the allocation strategy that you specify to pick the specific pools from all your possible pools.

You can specify one of the following allocation strategies for On-Demand Instances:

Lowest price

The On-Demand Instances come from the lowest priced pool that has available capacity. This is the default strategy.

If the lowest priced pool doesn't have available capacity, the On-Demand Instances come from the next lowest priced pool that has available capacity.

If a pool runs out of capacity before fulfilling your desired capacity, the fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive On-Demand Instances from several pools.

Prioritized

The fleet uses the priority that you assigned to each launch template override, launching instance types in order of the highest priority first. This strategy can't be used with attribute-based instance type selection. For an example of how to use this allocation strategy, see Prioritize instance types for On-Demand capacity.

Choose the appropriate Spot allocation strategy

You can optimize your fleet for your use case by choosing the appropriate Spot allocation strategy.

Balance lowest price and capacity availability

To balance the trade-offs between the lowest priced Spot capacity pools and the Spot capacity pools with the highest capacity availability, we recommend that you use the **price capacity optimized** allocation strategy. This strategy makes decisions about which pools to request Spot Instances from based on both the price of the pools and the capacity availability of Spot Instances in those pools. This means that Spot Instances are requested from the pools that are most likely to have the lowest chance of interruption in the near term, while still taking price into consideration.

If your fleet runs resilient and stateless workloads, including containerized applications, microservices, web applications, data and analytics jobs, and batch processing, then use the **price capacity optimized** allocation strategy for optimal cost savings and capacity availability.

If your fleet runs workloads that might have a higher cost of interruption associated with restarting work, then you should implement checkpointing so that applications can restart from that point

if they're interrupted. By using checkpointing, you make the **price capacity optimized** allocation strategy a good fit for these workloads because it allocates capacity from the lowest priced pools that also offer a low Spot Instance interruption rate.

For example JSON configurations that use the **price capacity optimized** allocation strategy, see the following:

- EC2 Fleet – Example 10: Launch Spot Instances in a price-capacity-optimized fleet
- Spot Fleet – Example 11: Launch Spot Instances in a priceCapacityOptimized fleet

When workloads have a high cost of interruption

You can optionally use the **capacity optimized** strategy if you run workloads that either use similarly priced instance types, or where the cost of interruption is so significant that any cost saving is inadequate in comparison to a marginal increase in interruptions. This strategy allocates capacity from the most available Spot capacity pools that offer the possibility of fewer interruptions, which can lower the overall cost of your workload.

When the possibility of interruptions must be minimized but the preference for certain instance types matters, you can express your pool priorities by using the **capacity optimized prioritized** allocation strategy and then setting the order of instance types to use from highest to lowest priority.

Note that when you set priorities for **capacity optimized prioritized**, the same priorities are also applied to your On-Demand Instances if the On-Demand allocation strategy is set to **prioritized**. Also note that, for Spot Fleet, using priorities is supported only if your fleet uses a launch template.

For example JSON configurations that use the **capacity optimized** allocation strategy, see the following:

- EC2 Fleet – Example 8: Launch Spot Instances in a capacity-optimized fleet
- Spot Fleet – Example 9: Launch Spot Instances in a capacity-optimized fleet

For example JSON configurations that use the **capacity optimized prioritized** allocation strategy, see the following:

- EC2 Fleet – Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities
- Spot Fleet – Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

When your workload is time flexible and capacity availability is not a factor

If your fleet is small or runs for a short time, you can use **price capacity optimized** to maximize cost savings while still considering capacity availability.

When your fleet is large or runs for a long time

If your fleet is large or runs for a long time, you can improve the availability of your fleet by distributing the Spot Instances across multiple pools using the **diversified** strategy. For example, if your fleet specifies 10 pools and a target capacity of 100 instances, the fleet launches 10 Spot Instances in each pool. If the Spot price for one pool exceeds your maximum price for this pool, only 10% of your fleet is affected. Using this strategy also makes your fleet less sensitive to increases in the Spot price in any one pool over time. With the **diversified** strategy, the fleet does not launch Spot Instances into any pools with a Spot price that is equal to or higher than the On-Demand price.

Maintain target capacity for Spot Instances

After Spot Instances are terminated due to a change in the Spot price or available capacity of a Spot capacity pool, a fleet of type `maintain` launches replacement Spot Instances. The allocation strategy determines the pools from which the replacement instances are launched, as follows:

- If the allocation strategy is **price capacity optimized**, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability while also taking price into consideration and identifying lowest priced pools with high capacity availability.
- If the allocation strategy is **capacity optimized**, the fleet launches replacement instances in the pools that have the most Spot Instance capacity availability.
- If the allocation strategy is **diversified**, the fleet distributes the replacement Spot Instances across the remaining pools.

Prioritize instance types for On-Demand capacity

When an EC2 Fleet or Spot Fleet attempts to fulfill your On-Demand capacity, it defaults to launching the lowest priced instance type first. If the On-Demand allocation strategy is set to **prioritized**, the fleet uses priority to determine which instance type to use first when fulfilling On-Demand capacity. The priority is assigned to the launch template override, and the highest priority is launched first.

Example: Prioritize instance types

In this example, you configure three launch template overrides, each with a different instance type.

The On-Demand price for the instance types range in price. The following are the instance types used in this example, listed in order of price, starting with the least expensive instance type:

- `m4.large` – least expensive
- `m5.large`
- `m5a.large`

If you do not use priority to determine the order, the fleet fulfills the On-Demand capacity by starting with the least expensive instance type.

However, say you have unused `m5.large` Reserved Instances that you want to use first. You can set the launch template override priority so that the instance types are used in the order of priority, as follows:

- `m5.large` – priority 1
- `m4.large` – priority 2
- `m5a.large` – priority 3

Use Capacity Rebalancing in EC2 Fleet and Spot Fleet to replace at-risk Spot Instances

With Capacity Rebalancing, your EC2 Fleet or Spot Fleet can maintain the desired Spot capacity by proactively replacing Spot Instances at risk of interruption. When a Spot Instance is at an elevated risk of interruption, Amazon EC2 sends a rebalance recommendation. If Capacity Rebalancing is enabled, the rebalance recommendation triggers the launch of a new Spot Instance before the at-risk instance is interrupted.

Capacity Rebalancing helps you maintain workload availability by proactively augmenting your fleet with new Spot Instances before running instances are interrupted by Amazon EC2.

To configure EC2 Fleet to use Capacity Rebalancing to launch a replacement Spot Instance

Use the create-fleet command and the relevant parameters in the `MaintenanceStrategies` structure. For an example JSON configuration, see Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances.

To configure Spot Fleet to use Capacity Rebalancing to launch a replacement Spot Instance

You can use the Amazon EC2 console or the AWS CLI to configure Capacity Rebalancing.

(Console) When creating the Spot Fleet, select the **Capacity rebalance** checkbox. For more information, see step 6.d. in Create a Spot Fleet request using defined parameters.

(AWS CLI) Use the request-spot-fleet command and the relevant parameters in the `SpotMaintenanceStrategies` structure. For an example JSON configuration, see Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances.

Topics

- Limitations
- Configuration options
- Considerations

Limitations

- Capacity Rebalancing is available only for fleets of type `maintain`.
- When the fleet is running, you can't modify the Capacity Rebalancing setting. To change the Capacity Rebalancing setting, you must delete the fleet and create a new fleet.

Configuration options

The `ReplacementStrategy` for EC2 Fleet and Spot Fleet supports the following two values:

`launch-before-terminate`

Amazon EC2 terminates the Spot Instances that receive a rebalance notification after new replacement Spot Instances are launched. When you specify `launch-before-terminate`, you must also specify a value for `termination-delay`. After the new replacement instances are launched, Amazon EC2 waits for the duration of the `termination-delay`, and then terminates the old instances. For `termination-delay`, the minimum is 120 seconds (2 minutes), and the maximum is 7200 seconds (2 hours).

We recommend that you use `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances

are terminated only after the shutdown procedures are completed. Note that Amazon EC2 can interrupt the old instances with a two-minute warning before the `termination-delay`.

We strongly recommend against using the `lowest-price` (EC2 Fleet) or `lowestPrice` (Spot Fleet) allocation strategy in combination with `launch-before-terminate` to avoid having replacement Spot Instances that are also at an elevated risk of interruption.

`launch`

Amazon EC2 launches replacement Spot Instances when a rebalance notification is emitted for existing Spot Instances. Amazon EC2 does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

Considerations

If you configure an EC2 Fleet or Spot Fleet for Capacity Rebalancing, consider the following:

Provide as many Spot capacity pools in the request as possible

Configure your fleet to use multiple instance types and Availability Zones. This provides the flexibility to launch Spot Instances in various Spot capacity pools. For more information, see Be flexible about instance types and Availability Zones.

Avoid an elevated risk of interruption of replacement Spot Instances

To avoid an elevated risk of interruption, we recommend the `capacity-optimized` or `capacity-optimized-prioritized` allocation strategy. These strategies ensure that replacement Spot Instances are launched in the most optimal Spot capacity pools, and are therefore less likely to be interrupted in the near future. For more information, see Use the price and capacity optimized allocation strategy.

If you use the `lowest-price` allocation strategy, your replacement Spot Instances might be at an elevated risk of interruption. This is because Amazon EC2 will always launch instances in the lowest priced pool that has available capacity at that moment, even if your replacement Spot Instances are likely to be interrupted soon after being launched.

Amazon EC2 will only launch a new instance if availability is the same or better

One of the goals of Capacity Rebalancing is to improve a Spot Instance's availability. If an existing Spot Instance receives a rebalance recommendation, Amazon EC2 will only launch

a new instance if the new instance provides the same or better availability than the existing instance. If the risk of interruption of a new instance will be worse than the existing instance, then Amazon EC2 will not launch a new instance. Amazon EC2 will, however, continue to assess the Spot capacity pools, and will launch a new instance if availability improves.

There is a chance that your existing instance will be interrupted without Amazon EC2 proactively launching a new instance. When this happens, Amazon EC2 will attempt to launch a new instance regardless of whether the new instance has a high risk of interruption.

Capacity Rebalancing does not increase your Spot Instance interruption rate

When you enable Capacity Rebalancing, it does not increase your Spot Instance interruption rate (the number of Spot Instances that are reclaimed when Amazon EC2 needs the capacity back). However, if Capacity Rebalancing detects an instance is at risk of interruption, Amazon EC2 will immediately attempt to launch a new instance. The result is that more instances might be replaced than if you'd waited for Amazon EC2 to launch a new instance after the at-risk instance was interrupted.

While you might replace more instances with Capacity Rebalancing enabled, you benefit from being proactive rather than reactive by having more time to take action before your instances are interrupted. With a Spot Instance interruption notice, you typically only have up to two minutes to gracefully shut down your instance. With Capacity Rebalancing launching a new instance in advance, you give existing processes a better chance of completing on your at-risk instance, you can start your instance shutdown procedures, and prevent new work from being scheduled on your at-risk instance. You can also start preparing the newly-launched instance to take over the application. With Capacity Rebalancing's proactive replacement, you benefit from graceful continuity.

As a theoretical example to demonstrate the risks and benefits of using Capacity Rebalancing, consider the following scenario:

- 2:00 PM – A rebalance recommendation is received for instance-A, and Amazon EC2 immediately starts attempting to launch a replacement instance-B, giving you time to start your shutdown procedures.*
- 2:30 PM – A rebalance recommendation is received for instance-B, replaced with instance-C, giving you time to start your shutdown procedures.*
- 2:32 PM – If Capacity Rebalancing wasn't enabled, and if a Spot Instance interruption notice would've been received at 2:32 PM for instance-A, you would only have had up to two minutes to take action, but Instance-A would have been running up till this time.

* If `launch-before-terminate` is specified, Amazon EC2 will terminate the at-risk instance after the replacement instance comes online.

Amazon EC2 can launch new replacement Spot Instances until fulfilled capacity is double target capacity

When a fleet is configured for Capacity Rebalancing, the fleet attempts to launch a new replacement Spot Instance for every Spot Instance that receives a rebalance recommendation. After a Spot Instance receives a rebalance recommendation, it is no longer counted as part of the fulfilled capacity. Depending on the replacement strategy, Amazon EC2 either terminates the instance after a preconfigured termination delay, or leaves it running. This gives you the opportunity to perform rebalancing actions on the instance.

If your fleet reaches double its target capacity, it stops launching new replacement instances even if the replacement instances themselves receive a rebalance recommendation.

For example, you create a fleet with a target capacity of 100 Spot Instances. All of the Spot Instances receive a rebalance recommendation, which causes Amazon EC2 to launch 100 replacement Spot Instances. This raises the number of fulfilled Spot Instances to 200, which is double the target capacity. Some of the replacement instances receive a rebalance recommendation, but no more replacement instances are launched because the fleet can't exceed double its target capacity.

Note that you are charged for all of the instances while they are running.

We recommend that you configure your fleet to terminate Spot Instances that receive a rebalance recommendation

If you configure your fleet for Capacity Rebalancing, we recommend that you choose `launch-before-terminate` with an appropriate termination delay only if you can predict how long your instance shutdown procedures will take to complete. This will ensure that the old instances are terminated only after the shutdown procedures are completed.

If you choose to terminate the instances that are recommended for rebalance yourself, we recommend that you monitor the rebalance recommendation signal that is received by the Spot Instances in the fleet. By monitoring the signal, you can quickly perform rebalancing actions on the affected instances before Amazon EC2 interrupts them, and then you can manually terminate them. If you do not terminate the instances, you continue paying for them while they are running. Amazon EC2 does not automatically terminate the instances that receive a rebalance recommendation.

You can set up notifications using Amazon EventBridge or instance metadata. For more information, see Monitor rebalance recommendation signals.

The fleet does not count instances that receive a rebalance recommendation when calculating fulfilled capacity during scale in or out

If your fleet is configured for Capacity Rebalancing, and you change the target capacity to either scale in or scale out, the fleet does not count the instances that are marked for rebalance as part of the fulfilled capacity, as follows:

- Scale in – If you decrease your desired target capacity, Amazon EC2 terminates instances that are not marked for rebalance until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

  For example, you create a fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so Amazon EC2 launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then reduce the target capacity to 50 (scale in), but the fulfilled capacity is actually 60 instances because the 10 instances that are marked for rebalance are not terminated by Amazon EC2. You need to manually terminate these instances, or you can leave them running.
- Scale out – If you increase your desired target capacity, Amazon EC2 launches new instances until the desired capacity is reached. The instances that are marked for rebalance are not counted towards the fulfilled capacity.

  For example, you create a fleet with a target capacity of 100 Spot Instances. 10 instances receive a rebalance recommendation, so the fleet launches 10 new replacement instances, resulting in a fulfilled capacity of 110 instances. You then increase the target capacity to 200 (scale out), but the fulfilled capacity is actually 210 instances because the 10 instances that are marked for rebalance are not counted by the fleet as part of the target capacity. You need to manually terminate these instances, or you can leave them running.

Use Capacity Reservations to reserve On-Demand capacity in EC2 Fleet

Work with EC2 Fleet

To start using an EC2 Fleet, create a request that includes the total target capacity, On-Demand capacity, Spot capacity, and a launch template specifying the configuration for the instances in the fleet. You can optionally specify additional parameters, or let the fleet use default values. You can also tag the fleet request, and its instances and volumes, when you create the fleet.

The fleet launches On-Demand Instances when there is available capacity, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

After your fleet is launched, you can describe the fleet request, the instances in the fleet, and any fleet events. You can also assign additional tags as needed.

If you need to change any fleet parameters, such as the total target capacity, you can modify the fleet, provided it was configured to maintain capacity. You can't modify the capacity of a one-time request after it's been submitted.

The fleet request remains active until it expires or you delete it. When you delete the fleet request, you can either terminate the instances or leave them running. If you choose to leave them running, the On-Demand Instances run until you terminate them, and the Spot Instances run until they're interrupted or you terminate them.

Topics

- EC2 Fleet request states
- EC2 Fleet prerequisites
- Create an EC2 Fleet
- Tag a new or existing EC2 Fleet request and the instances and volumes it launches
- Describe an EC2 Fleet, its instances, and its events
- Modify an EC2 Fleet
- Delete an EC2 Fleet request and the instances in the fleet

EC2 Fleet request states

An EC2 Fleet request can be one of various states, with each state indicating a different stage of the request's lifecycle and its management of instances.

An EC2 Fleet request can be in one of the following states:

`submitted`

> The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. If a request would exceed your fleet limits, it is deleted immediately.

`active`

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances. The request remains in this state until it is modified or deleted.

`modifying`

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed or the request is deleted. Only a `maintain` fleet type can be modified. This state does not apply to other request types.

`deleted_running`

The EC2 Fleet request is deleted and does not launch additional Spot Instances. Its existing instances continue to run until they are interrupted or terminated manually. The request remains in this state until all instances are interrupted or terminated. Only an EC2 Fleet of type `maintain` or `request` can have running instances after the EC2 Fleet request is deleted. A deleted `instant` fleet with running instances is not supported. This state does not apply to `instant` fleets.

`deleted_terminating`

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

`deleted`

The EC2 Fleet request is deleted and has no running instances. The request is deleted two days after its instances are terminated.

EC2 Fleet prerequisites

To create an EC2 Fleet, the following prerequisites must be in place:

- Launch template
- Service-linked role for EC2 Fleet
- Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots
- Permissions for EC2 Fleet users

Launch template

A launch template specifies the configuration information about the instances to launch, such as the instance type and Availability Zone. For more information about launch templates, see Store instance launch parameters in Amazon EC2 launch templates.

Service-linked role for EC2 Fleet

The `AWSServiceRoleForEC2Fleet` role grants the EC2 Fleet permission to request, launch, terminate, and tag instances on your behalf. Amazon EC2 uses this service-linked role to complete the following actions:

- `ec2:RunInstances` – Launch instances.
- `ec2:RequestSpotInstances` – Request Spot Instances.
- `ec2:TerminateInstances` – Terminate instances.
- `ec2:DescribeImages` – Describe Amazon Machine Images (AMIs) for the instances.
- `ec2:DescribeInstanceStatus` – Describe the status of the instances.
- `ec2:DescribeSubnets` – Describe the subnets for instances.
- `ec2:CreateTags` – Add tags to the EC2 Fleet, instances, and volumes.

Ensure that this role exists before you use the AWS CLI or an API to create an EC2 Fleet.

> **Note**
>
> An `instant` EC2 Fleet does not require this role.

To create the role, use the IAM console as follows.

To create the AWSServiceRoleForEC2Fleet role for EC2 Fleet

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. On the **Select trusted entity** page, do the following:

a. For **Trusted entity type**, choose **AWS service**.

b. Under **Use case**, for **Service or use case**, choose **EC2 - Fleet**.

> **Tip**
>
> Be sure to choose **EC2 - Fleet**. If you choose **EC2**, the **EC2 - Fleet** use case does not appear in the **Use case** list. The **EC2 - Fleet** use case will automatically create a policy with the required IAM permissions and will suggest **AWSServiceRoleForEC2Fleet** as the role name.

c. Choose **Next**.

5. On the **Add permissions page**, choose **Next**.
6. On the **Name, review, and create** page, choose **Create role**.

If you no longer need to use EC2 Fleet, we recommend that you delete the **AWSServiceRoleForEC2Fleet** role. After this role is deleted from your account, you can create the role again if you create another fleet.

For more information, see Service-linked roles in the *IAM User Guide*.

Grant access to customer managed keys for use with encrypted AMIs and EBS snapshots

If you specify an encrypted AMI or an encrypted Amazon EBS snapshot in your EC2 Fleet and you use an AWS KMS key for encryption, you must grant the **AWSServiceRoleForEC2Fleet** role permission to use the customer managed key so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the customer managed key, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see Using grants and Using key policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

To grant the AWSServiceRoleForEC2Fleet role permissions to use the customer managed key

- Use the create-grant command to add a grant to the customer managed key and to specify the principal (the **AWSServiceRoleForEC2Fleet** service-linked role) that is given permission to perform the operations that the grant permits. The customer managed key is specified by the

`key-id` parameter and the ARN of the customer managed key. The principal is specified by the `grantee-principal` parameter and the ARN of the **AWSServiceRoleForEC2Fleet** service-linked role.

```
aws kms create-grant \
    --region us-east-1 \
    --key-id arn:aws-eusc:kms:us-
east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
    --grantee-principal arn:aws-eusc:iam::111122223333:role/
AWSServiceRoleForEC2Fleet \
    --operations "Decrypt" "Encrypt" "GenerateDataKey"
 "GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
 "ReEncryptTo"
```

Permissions for EC2 Fleet users

If your users will create or manage an EC2 Fleet, be sure to grant them the required permissions.

To create a policy for EC2 Fleet

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**.
3. Choose **Create policy**.
4. On the **Create policy** page, choose the **JSON** tab, replace the text with the following, and choose **Review policy**.

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:*"
            ],
            "Resource": "*"
        },
        {
```

```
            "Effect": "Allow",
            "Action": [
              "iam:ListRoles",
              "iam:PassRole",
              "iam:ListInstanceProfiles"
            ],
            "Resource":"arn:aws-eusc:iam::123456789012:role/DevTeam*"
        }
    ]
}
```

The `ec2:*` grants a user permission to call all Amazon EC2 API actions. To limit the user to specific Amazon EC2 API actions, specify those actions instead.

The user must have permission to call the `iam:ListRoles` action to enumerate existing IAM roles, the `iam:PassRole` action to specify the EC2 Fleet role, and the `iam:ListInstanceProfiles` action to enumerate existing instance profiles.

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must also add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam:CreateInstanceProfile`
- `iam:CreateRole`
- `iam:GetRole`
- `iam:ListPolicies`

5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:

   - Users and groups in AWS IAM Identity Center:

     Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.

   - Users managed in IAM through an identity provider:

     Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.

- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

Create an EC2 Fleet

To create an EC2 Fleet, define the fleet configuration in a JSON file and reference the file with the create-fleet command. In the JSON file, you must specify the total target capacity for the fleet, separate target capacities for Spot Instances and On-Demand Instances, and a launch template that defines the configuration for the instances in the fleet, such as an AMI, instance type, subnet or Availability Zone, and one or more security groups. You can optionally specify additional configurations, such as parameters to override the launch template configuration, allocation strategies for selecting Spot Instances and On-Demand Instances from the EC2 capacity pools, and the maximum amount you're willing to pay for the fleet. For more information, see Configuration options for your EC2 Fleet or Spot Fleet.

The EC2 Fleet launches On-Demand Instances when capacity is available, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

If your fleet includes Spot Instances and is of type `maintain`, Amazon EC2 will attempt to maintain your fleet target capacity when your Spot Instances are interrupted.

EC2 Fleet limitations

The following limitations apply to EC2 Fleet:

- Creating an EC2 Fleet is available only through the Amazon EC2 API, AWS CLI, AWS SDKs, and CloudFormation.
- An EC2 Fleet request can't span AWS Regions. You need to create a separate EC2 Fleet for each Region.
- An EC2 Fleet request can't span different subnets from the same Availability Zone.

Create an EC2 Fleet

To launch a fleet of instances using EC2 Fleet, you need only specify the following parameters in your fleet request, and the fleet will use the default values for the other parameters:

- `LaunchTemplateId` or `LaunchTemplateName` – Specifies the launch template to use (which contains the parameters for the instances to launch, such as the instance type and Availability Zone)
- `TotalTargetCapacity` – Specifies the total target capacity for the fleet
- `DefaultTargetCapacityType` – Specifies whether the default purchasing option is On-Demand or Spot

To override the parameters specified in the launch template, you can specify one or more overrides. Each override can vary by instance type, Availability Zone, subnet, and maximum price, and can include a different weighted capacity. As an alternative to specifying an instance type, you can specify the attributes that an instance must have, and Amazon EC2 will identify all the instance types with those attributes. For more information, see Specify attributes for instance type selection for EC2 Fleet or Spot Fleet.

For EC2 Fleets of type `instant`, you can specify a Systems Manager parameter instead of the AMI ID. You can specify the Systems Manager parameter in the override or in the launch template. For more information, see Use a Systems Manager parameter instead of an AMI ID.

You can specify the fleet parameters in a JSON file. For information about all the possible parameters you can specify, see View all the EC2 Fleet configuration options.

For fleet configuration examples, see Example CLI configurations for EC2 Fleet.

There is currently no console support for creating an EC2 Fleet.

To create an EC2 Fleet

Use the create-fleet command to create the fleet and specify the JSON file that contains the fleet configuration parameters.

```
aws ec2 create-fleet --cli-input-json file://file_name.json
```

The following is example output for a fleet of type `request` or `maintain`.

```
{
    "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE"
}
```

The following is example output for a fleet of type `instant` that launched the target capacity.

```
{
  "FleetId": "fleet-12a34b55-67cd-8ef9-ba9b-9208dEXAMPLE",
  "Errors": [],
  "Instances": [
    {
      "LaunchTemplateAndOverrides": {
        "LaunchTemplateSpecification": {
          "LaunchTemplateId": "lt-01234a567b8910abcEXAMPLE",
          "Version": "1"
        },
        "Overrides": {
          "InstanceType": "c5.large",
          "AvailabilityZone": "us-east-1a"
        }
      },
      "Lifecycle": "on-demand",
      "InstanceIds": [

Create an EC2 Fleet that replaces unhealthy Spot Instances

EC2 Fleet checks the health status of the instances in the fleet every two minutes. The health status of an instance is either `healthy` or `unhealthy`.

EC2 Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as `unhealthy` when the status of either the instance status check or the system status check is `impaired` for three consecutive health status checks. For more information, see Status checks for Amazon EC2 instances.

You can configure your fleet to replace unhealthy Spot Instances. After setting `ReplaceUnhealthyInstances` to `true`, a Spot Instance is replaced when it is reported as `unhealthy`. The fleet can go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for EC2 Fleets that maintain a target capacity (fleets of type `maintain`), and not for fleets of type `request` or `instant`.
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your EC2 Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the `ec2:DescribeInstanceStatus` action.

To configure an EC2 Fleet to replace unhealthy Spot Instances

1. Use the information for creating an EC2 Fleet in Create an EC2 Fleet.
2. To configure the fleet to replace unhealthy Spot Instances, in the JSON file, for `ReplaceUnhealthyInstances`, specify `true`.

View all the EC2 Fleet configuration options

To view the full list of EC2 Fleet configuration parameters, you can generate a JSON file. For a description of each parameter, see create-fleet.

To generate a JSON file with all possible EC2 Fleet parameters

Use the create-fleet (AWS CLI) command and the `--generate-cli-skeleton` parameter to generate an EC2 Fleet JSON file, and direct the output to a file to save it.

```
aws ec2 create-fleet \
    --generate-cli-skeleton input > ec2createfleet.json
```

The following is example output.

```
{
    "DryRun": true,
    "ClientToken": "",
    "SpotOptions": {
        "AllocationStrategy": "price-capacity-optimized",

```

Tag a new or existing EC2 Fleet request and the instances and volumes it launches

To help categorize and manage your EC2 Fleet requests and the instances and volumes that it launches, you can tag them with custom metadata. You can assign a tag to an EC2 Fleet request when you create it, or afterward. Similarly, you can assign a tag to the instances and volumes when they're launched by the fleet, or afterward.

When you tag a fleet request, the instances and volumes that are launched by the fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the fleet. You can choose to assign tags to only the fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all of them.

> **Note**
>
> For `instant` fleet types, you can tag volumes that are attached to On-Demand Instances and Spot Instances. For `request` or `maintain` fleet types, you can only tag volumes that are attached to On-Demand Instances.

For more information about how tags work, see Tag your Amazon EC2 resources.

Prerequisite

Grant the user the permission to tag resources. For more information, see Example: Tag resources.

To grant a user the permission to tag resources

Create a IAM policy that includes the following:

- The `ec2:CreateTags` action. This grants the user permission to create tags.
- The `ec2:CreateFleet` action. This grants the user permission to create an EC2 Fleet request.
- For `Resource`, we recommend that you specify `"*"`. This allows users to tag all resource types.

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

To tag a new EC2 Fleet request

To tag an EC2 Fleet request when you create it, specify the key-value pair in the JSON file used to create the fleet. The value for `ResourceType` must be `fleet`. If you specify another value, the fleet request fails.

To tag instances and volumes launched by an EC2 Fleet

To tag instances and volumes when they are launched by the fleet, specify the tags in the launch template that is referenced in the EC2 Fleet request.

> **Note**
>
> You can't tag volumes attached to Spot Instances that are launched by a `request` or `maintain` fleet type.

To tag an existing EC2 Fleet request, instance, and volume

Use the create-tags command to tag existing resources.

```
aws ec2 create-tags \
    --resources fleet-12a34b55-67cd-8ef9-
ba9b-9208dEXAMPLE i-1234567890abcdef0 vol-1234567890EXAMPLE \
    --tags Key=purpose,Value=test
```

Describe an EC2 Fleet, its instances, and its events

You can describe your EC2 Fleet configuration, the instances in your EC2 Fleet, and the event history of your EC2 Fleet.

Tasks

- Describe your EC2 Fleet
- Describe all instances in your EC2 Fleet
- Describe the event history for your EC2 Fleet

Describe your EC2 Fleet

AWS CLI

To describe your EC2 Fleet

Use the describe-fleets command.

```
aws ec2 describe-fleets \
    --fleet-ids fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

The following is example output.

```
{
    "Fleets": [
        {
            "ActivityStatus": "fulfilled",
            "CreateTime": "2022-02-09T03:35:52+00:00",
            "FleetId": "fleet-364457cd-3a7a-4ed9-83d0-7b63e51bb1b7",
            "FleetState": "active",
            "ExcessCapacityTerminationPolicy": "termination",
            "FulfilledCapacity": 2.0,
            "FulfilledOnDemandCapacity": 0.0,
            "LaunchTemplateConfigs": [
                {
                    "LaunchTemplateSpecification": {
                        "LaunchTemplateName": "my-launch-template",
                        "Version": "$Latest"
                    }
                }
            ],
            "TargetCapacitySpecification": {
                "TotalTargetCapacity": 2,
                "OnDemandTargetCapacity": 0,
                "SpotTargetCapacity": 2,
                "DefaultTargetCapacityType": "spot"
            },
            "TerminateInstancesWithExpiration": false,
            "Type": "maintain",
            "ReplaceUnhealthyInstances": false,
            "SpotOptions": {
                "AllocationStrategy": "capacity-optimized",
                "InstanceInterruptionBehavior": "terminate"
            },
            "OnDemandOptions": {
                "AllocationStrategy": "lowestPrice"
            }
        }
    ]
```

```
}
```

PowerShell

To describe your EC2 Fleet

Use the Get-EC2FleetList cmdlet.

```
Get-EC2FleetList `
    -FleetId fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Describe all instances in your EC2 Fleet

The returned list of running instances is refreshed periodically and might be out of date.

AWS CLI

To describe the instances for the specified EC2 Fleet

Use the describe-fleet-instances command.

```
aws ec2 describe-fleet-instances \
    --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

The following is example output.

```
{
    "ActiveInstances": [
        {
            "InstanceId": "i-09cd595998cb3765e",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-86k84j6p"
        },
        {
            "InstanceId": "i-09cf95167ca219f17",
            "InstanceHealth": "healthy",
            "InstanceType": "m4.large",
            "SpotInstanceRequestId": "sir-dvxi7fsm"
        }
```

```
    ],
    "FleetId": "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
}
```

PowerShell

To describe the instances for the specified EC2 Fleet

Use the Get-EC2FleetInstanceList cmdlet.

```
Get-EC2FleetInstanceList `
    -FleetId fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

Describe the event history for your EC2 Fleet

For more information about the events in the event history, see EC2 Fleet event types.

AWS CLI

To describe the events for the specified EC2 Fleet

Use the describe-fleet-history command.

```
aws ec2 describe-fleet-history \
    --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --start-time 2020-06-01T00:00:00Z
```

The following is example output.

```
{
    "HistoryRecords": [
        {
            "EventInformation": {
                "EventSubType": "submitted"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:05.000Z"
        },
        {
            "EventInformation": {
                "EventSubType": "active"
```

```
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:15.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "t2.small, ami-07c8bc5c1ce9598c3, ...",
                "EventSubType": "progress"
            },
            "EventType": "fleetRequestChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        },
        {
            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-083a1c446e66085d2"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"

            "EventInformation": {
                "EventDescription": "{\"instanceType\":\"t2.small\", ...}",
                "EventSubType": "launched",
                "InstanceId": "i-090db02406cc3c2d6"
            },
            "EventType": "instanceChange",
            "Timestamp": "2020-09-01T18:26:17.000Z"
        }
    ],
    "FleetId": "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
    "LastEvaluatedTime": "1970-01-01T00:00:00.000Z",
    "StartTime": "2020-06-01T00:00:00.000Z"
}
```

PowerShell

To describe the events for the specified EC2 Fleet

Use the Get-EC2FleetHistory cmdlet.

```
Get-EC2FleetHistory `
    -FleetId fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE `
```

```
    -UtcStartTime 2020-06-01T00:00:00Z
```

Modify an EC2 Fleet

You can modify the total target capacity, Spot capacity, and On-Demand capacity of an EC2 Fleet. You can also modify whether running instances should be terminated if the new total target capacity is reduced below the current size of the fleet.

Considerations

Consider the following when modifying an EC2 Fleet:

- **Fleet type** – You can only modify an EC2 Fleet of type `maintain`. You can't modify an EC2 Fleet of type `request` or `instant`.
- **Fleet parameters** – You can modify the following parameters of an EC2 Fleet:
  - `target-capacity-specification` – Increase or decrease the target capacity for:
    - `TotalTargetCapacity`
    - `OnDemandTargetCapacity`
    - `SpotTargetCapacity`
  - `excess-capacity-termination-policy` – Whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the fleet. Valid values are:
    - `no-termination`
    - `termination`
- **Fleet behavior when increasing total target capacity** – When you increase the total target capacity, the EC2 Fleet launches the additional instances according to the instance purchasing option specified for `DefaultTargetCapacityType`, which is either On-Demand Instances or Spot Instances, and according to the specified allocation strategy.
- **Fleet behavior when decreasing Spot target capacity** – When you decrease the Spot target capacity, the EC2 Fleet deletes any open requests that exceed the new target capacity. You can request that the fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. When an EC2 Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

  Instances are selected for termination based on the allocation strategy:

- `capacity-optimized` – Terminates instances from pools with the least available capacity.
- `price-capacity-optimized` – Uses a combination of price and available capacity: terminates instances from pools with the least available capacity and which are the highest-priced among these pools.
- `diversified` – Terminates instances across all pools.
- `lowest-price` – Terminates instances from highest-priced pools.

Alternatively, you can request that EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

- **Fleet state** – You can modify an EC2 Fleet that is in the `submitted` or `active` state. When you modify a fleet, it enters the `modifying` state.

Commands for modifying an EC2 Fleet

AWS CLI

To modify the total target capacity of an EC2 Fleet

Use the modify-fleet command.

```
aws ec2 modify-fleet \
    --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --target-capacity-specification TotalTargetCapacity=20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous example as follows.

```
aws ec2 modify-fleet \
    --fleet-id fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --target-capacity-specification TotalTargetCapacity=10 \
    --excess-capacity-termination-policy no-termination
```

PowerShell

To modify the total target capacity of an EC2 Fleet

Use the Edit-EC2Fleet cmdlet.

```
Edit-EC2Fleet `
```

```
    -FleetId "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TargetCapacitySpecification_TotalTargetCapacity 20
```

If you are decreasing the target capacity but want to keep the fleet at its current size, you can modify the previous example as follows.

```
Edit-EC2Fleet `
    -FleetId "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TargetCapacitySpecification_TotalTargetCapacity 20 `
    -ExcessCapacityTerminationPolicy "NoTermination"
```

Delete an EC2 Fleet request and the instances in the fleet

If you no longer require an EC2 Fleet request, you can delete it. After you delete a fleet request, all Spot requests associated with the fleet are canceled, so that no new Spot Instances are launched.

When you delete an EC2 Fleet request, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances. For `instant` fleets, EC2 Fleet must terminate the instances when the fleet is deleted. A deleted `instant` fleet with running instances is not supported.

> **Warning**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

If you specify that the instances must be terminated when the fleet request is deleted, the fleet request enters the `deleted_terminating` state. Otherwise, it enters the `deleted_running` state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can delete up to 25 fleets of type `instant` in a single operation.

- You can delete up to 100 fleets of type `maintain` or `request` in a single operation.
- You can delete up to 125 fleets in a single operation, provided you do not exceed the quota for each fleet type, as specified above.
- If you exceed the specified number of fleets to delete, no fleets are deleted.
- A deleted `instant` fleet with running instances is not supported. When you delete an `instant` fleet, Amazon EC2 automatically terminates all its instances. For `instant` fleets with more than 1000 instances, the deletion request might fail. If your fleet has more than 1000 instances, first terminate most of the instances manually, leaving 1000 or fewer. Then delete the fleet, and the remaining instances will be terminated automatically.

AWS CLI

To delete an EC2 Fleet request and terminate its instances

Use the delete-fleets command with the `--terminate-instances` option.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

The following is example output.

```
{
    "UnsuccessfulFleetDeletions": [],
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_terminating",
            "PreviousFleetState": "active",
            "FleetId": "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
        }
    ]
}
```

To delete an EC2 Fleet request without terminating its instances

Modify the previous example by using the `--no-terminate-instances` option instead. Note that `--no-terminate-instances` is not supported for `instant` fleets.

```
aws ec2 delete-fleets \
    --fleet-ids fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
```

```
    --no-terminate-instances
```

The following is example output.

```
{
    "UnsuccessfulFleetDeletions": [],
    "SuccessfulFleetDeletions": [
        {
            "CurrentFleetState": "deleted_running",
            "PreviousFleetState": "active",
            "FleetId": "fleet-4b8aaae8-dfb5-436d-a4c6-3dafa4c6b7dcEXAMPLE"
        }
    ]
}
```

PowerShell

To delete an EC2 Fleet request and terminate its instances

Use the Remove-EC2Fleet cmdlet with the `-TerminateInstance` parameter.

```
Remove-EC2Fleet `
    -FleetId "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TerminateInstance $true
```

To delete an EC2 Fleet request without terminating its instances

Modify the previous example by changing the value of the `-TerminateInstance` parameter.

```
Remove-EC2Fleet `
    -FleetId "fleet-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TerminateInstance $false
```

Troubleshoot when a fleet fails to delete

If an EC2 Fleet request fails to delete, `UnsuccessfulFleetDeletions` in the output returns the ID of the EC2 Fleet request, an error code, and an error message.

The error codes are:

- `ExceededInstantFleetNumForDeletion`

- fleetIdDoesNotExist
- fleetIdMalformed
- fleetNotInDeletableState
- NoTerminateInstancesNotSupported
- UnauthorizedOperation
- unexpectedError

Troubleshoot ExceededInstantFleetNumForDeletion

If you try to delete more than 25 instant fleets in a single request, the ExceededInstantFleetNumForDeletion error is returned. The following is example output for this error.

```
{
    "UnsuccessfulFleetDeletions": [
     {
          "FleetId": " fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
          "Error": {
                 "Message": "Can’t delete more than 25 instant fleets in a single
 request.",
                 "Code": "ExceededInstantFleetNumForDeletion"
           }
     },
     {
           "FleetId": "fleet-9a941b23-0286-5bf4-2430-03a029a07e31",
           "Error": {
                 "Message": "Can’t delete more than 25 instant fleets in a single
 request.",
                 "Code": "ExceededInstantFleetNumForDeletion"
            }
     }
     .
     .
     .
     ],
     "SuccessfulFleetDeletions": []
}
```

Troubleshoot NoTerminateInstancesNotSupported

If you specify that the instances in an `instant` fleet must not be terminated when you delete the fleet, the `NoTerminateInstancesNotSupported` error is returned. `--no-terminate-instances` is not supported for `instant` fleets. The following is example output for this error.

```
{
      "UnsuccessfulFleetDeletions": [
            {
                  "FleetId": "fleet-5d130460-0c26-bfd9-2c32-0100a098f625",
                  "Error": {
                         "Message": "NoTerminateInstances option is not supported for
 instant fleet",
                         "Code": "NoTerminateInstancesNotSupported"
                   }
            }
       ],
       "SuccessfulFleetDeletions": []
}
```

Troubleshoot `UnauthorizedOperation`

If you do not have permission to terminate instances, you get the `UnauthorizedOperation` error when deleting a fleet that must terminate its instances. The following is the error response.

```
<Response><Errors><Error><Code>UnauthorizedOperation</Code><Message>You are not
 authorized to perform this
operation. Encoded authorization failure message: VvuncIxj7Z_CPGNYXWqnuFV-
YjByeAU66Q9752NtQ-I3-qnDLWs6JLFd

PT9vrHtQiILor5VVTsjSPWg7edj__1rsnXhwPSu8gI48ZLRGrPQqFq0RmKO_QIE8N8s6NWzCK4yoX-9gDcheurOGpkprPIC
</Message></Error></Errors><RequestID>89b1215c-7814-40ae-a8db-41761f43f2b0</
RequestID></Response>
```

To resolve the error, you must add the `ec2:TerminateInstances` action to the IAM policy, as shown in the following example.

Work with Spot Fleet

Important

We strongly discourage using Spot Fleet because it uses a legacy API with no planned investment. If you want to manage your instance lifecycle, use EC2 Fleet instead. If you don't want to manage your instance lifecycle, use an Auto Scaling group instead. Use Spot Fleet only if you need console support for a use case where you would use EC2 Fleet. For more information, see Which is the best fleet method to use?.

To start using a Spot Fleet, create a request that includes the total target capacity for Spot Instances, an optional On-Demand portion, and either manually specify an AMI and a key pair, or specify a launch template that includes the configuration for the instances in the fleet. You can optionally specify additional parameters, or let the fleet use default values. You can also tag the fleet request, and its instances and volumes, when you create the fleet.

The fleet launches On-Demand Instances when there is available capacity, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

After your fleet is launched, you can describe the fleet request, the instances in the fleet, and any fleet events. You can also assign additional tags as needed.

If you need to change any fleet parameters, such as the total target capacity, you can modify the fleet, provided it was configured to maintain capacity. You can't modify the capacity of a one-time request after it's been submitted.

The fleet request remains active until it expires or you cancel (delete) it. When you cancel the fleet request, you can either terminate the instances or leave them running. If you choose to leave them running, the On-Demand Instances run until you terminate them, and the Spot Instances run until they're interrupted or you terminate them.

Topics

- Spot Fleet request states
- Spot Fleet permissions
- Create a Spot Fleet
- Tag a new or existing Spot Fleet request and the instances and volumes it launches
- Describe a Spot Fleet request, its instances, and event history

- Modify a Spot Fleet request
- Cancel (delete) a Spot Fleet request
- Understand automatic scaling for Spot Fleet

Spot Fleet request states

> **Important**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

A Spot Fleet request can be one of various states, with each state indicating a different stage of the request's lifecycle and its management of instances.

A Spot Fleet request can be in one of the following states:

`submitted`

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances. If a request would exceed your Spot Fleet quotas, it is canceled immediately.

`active`

The Spot Fleet has been validated and Amazon EC2 is attempting to maintain the target number of running Spot Instances. The request remains in this state until it is modified or canceled.

`modifying`

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed or the request is canceled. Only a `maintain` fleet type can be modified. This state does not apply to a one-time `request` fleet type.

`cancelled_running`

The Spot Fleet is canceled (deleted) and does not launch additional Spot Instances. Its existing instances continue to run until they are interrupted or terminated manually. The request remains in this state until all instances are interrupted or terminated.

`cancelled_terminating`

The Spot Fleet is canceled (deleted) and its instances are terminating. The request remains in this state until all instances are terminated.

`cancelled`

The Spot Fleet is canceled (deleted) and has no running instances. The request is deleted two days after its instances are terminated.

Spot Fleet permissions

Important

Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

If your users will create or manage a Spot Fleet, you need to grant them the required permissions.

If you use the Amazon EC2 console to create a Spot Fleet, it creates two service-linked roles named `AWSServiceRoleForEC2SpotFleet` and `AWSServiceRoleForEC2Spot`, and a role named `aws-ec2-spot-fleet-tagging-role` that grant the Spot Fleet the permissions to request, launch, terminate, and tag resources on your behalf. If you use the AWS CLI or an API, you must ensure that these roles exist.

Use the following instructions to grant the required permissions and create the roles.

Permissions and roles

- Grant permission to users for Spot Fleet
- Service-linked role for Spot Fleet
- Service-linked role for Spot Instances
- IAM role for tagging a Spot Fleet

Grant permission to users for Spot Fleet

If your users will create or manage a Spot Fleet, be sure to grant them the required permissions.

To create a policy for Spot Fleet

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Policies**, **Create policy**.
3. On the **Create policy** page, choose **JSON**, and replace the text with the following.

   JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "ec2:RunInstances",
                "ec2:CreateTags",
                "ec2:RequestSpotFleet",
                "ec2:ModifySpotFleetRequest",
                "ec2:CancelSpotFleetRequests",
                "ec2:DescribeSpotFleetRequests",
                "ec2:DescribeSpotFleetInstances",
                "ec2:DescribeSpotFleetRequestHistory"
            ],
            "Resource": "*"
        },
        {
            "Effect": "Allow",
            "Action": "iam:PassRole",
            "Resource": "arn:aws-eusc:iam::*:role/aws-ec2-spot-fleet-tagging-
role"
        },
        {
            "Effect": "Allow",
            "Action": [
                "iam:CreateServiceLinkedRole",
                "iam:ListRoles",
                "iam:ListInstanceProfiles"
            ],
            "Resource": "*"
        }
    ]
```

```
}
```

The preceding example policy grants a user the permissions required for most Spot Fleet use cases. To limit the user to specific API actions, specify only those API actions instead.

Required EC2 and IAM APIs

The following APIs must be included in the policy:

- `ec2:RunInstances` – Required to launch instances in a Spot Fleet
- `ec2:CreateTags` – Required to tag the Spot Fleet request, instances, or volumes
- `iam:PassRole` – Required to specify the Spot Fleet role
- `iam:CreateServiceLinkedRole` – Required to create the service-linked role
- `iam:ListRoles` – Required to enumerate existing IAM roles
- `iam:ListInstanceProfiles` – Required to enumerate existing instance profiles

> **Important**
>
> If you specify a role for the IAM instance profile in the launch specification or launch template, you must grant the user the permission to pass the role to the service. To do this, in the IAM policy include "`arn:aws-eusc:iam::*:role/`*`IamInstanceProfile-role`*" as a resource for the `iam:PassRole` action. For more information, see Granting a user permissions to pass a role to an AWS service in the *IAM User Guide*.

Spot Fleet APIs

Add the following Spot Fleet API actions to your policy, as needed:

- `ec2:RequestSpotFleet`
- `ec2:ModifySpotFleetRequest`
- `ec2:CancelSpotFleetRequests`
- `ec2:DescribeSpotFleetRequests`
- `ec2:DescribeSpotFleetInstances`

- `ec2:DescribeSpotFleetRequestHistory`

Optional IAM APIs

(Optional) To enable a user to create roles or instance profiles using the IAM console, you must add the following actions to the policy:

- `iam:AddRoleToInstanceProfile`
- `iam:AttachRolePolicy`
- `iam:CreateInstanceProfile`
- `iam:CreateRole`
- `iam:GetRole`
- `iam:ListPolicies`

4. Choose **Review policy**.
5. On the **Review policy** page, enter a policy name and description, and choose **Create policy**.
6. To provide access, add permissions to your users, groups, or roles:

   - Users and groups in AWS IAM Identity Center:

     Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.

   - Users managed in IAM through an identity provider:

     Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.

   - IAM users:

     - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
     - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

Service-linked role for Spot Fleet

Amazon EC2 uses service-linked roles for the permissions that it requires to call other AWS services on your behalf. A service-linked role is a unique type of IAM role that is linked directly to an AWS

service. Service-linked roles provide a secure way to delegate permissions to AWS services because only the linked service can assume a service-linked role. For more information, see Service-linked roles in the *IAM User Guide*.

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2SpotFleet** to launch and manage instances on your behalf.

> **Important**
>
> If you specify an encrypted AMI or an encrypted Amazon EBS snapshot in your Spot Fleet, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. For more information, see Grant access to CMKs for use with encrypted AMIs and EBS snapshots.

Permissions granted by AWSServiceRoleForEC2SpotFleet

The **AWSServiceRoleForEC2SpotFleet** role grants the Spot Fleet permission to request, launch, terminate, and tag instances on your behalf. Amazon EC2 uses this service-linked role to complete the following actions:

- `ec2:RequestSpotInstances` - Request Spot Instances
- `ec2:RunInstances` - Launch instances
- `ec2:TerminateInstances` - Terminate instances
- `ec2:DescribeImages` - Describe Amazon Machine Images (AMIs) for the instances
- `ec2:DescribeInstanceStatus` - Describe the status of the instances
- `ec2:DescribeSubnets` - Describe the subnets for the instances
- `ec2:CreateTags` - Add tags to the Spot Fleet request, instances, and volumes
- `elasticloadbalancing:RegisterInstancesWithLoadBalancer` - Add the specified instances to the specified load balancer
- `elasticloadbalancing:RegisterTargets` - Register the specified targets with the specified target group

Create the service-linked role

Under most circumstances, you don't need to manually create a service-linked role. Amazon EC2 creates the **AWSServiceRoleForEC2SpotFleet** service-linked role the first time you create a Spot Fleet using the console.

If you had an active Spot Fleet request before October 2017, when Amazon EC2 began supporting this service-linked role, Amazon EC2 created the **AWSServiceRoleForEC2SpotFleet** role in your AWS account. For more information, see A new role appeared in my AWS account in the *IAM User Guide*.

If you use the AWS CLI or an API to create a Spot Fleet, you must first ensure that this role exists.

To create the AWSServiceRoleForEC2SpotFleet role for Spot Fleet using the console

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. On the **Select trusted entity** page, do the following:
   a. For **Trusted entity type**, choose **AWS service**.
   b. Under **Use case**, for **Service or use case**, choose **EC2**.
   c. For **Use case**, choose **EC2 - Spot Fleet**.

      > **Note**
      >
      > The **EC2 - Spot Fleet** use case will automatically create a policy with the required IAM permissions and will suggest **AWSEC2SpotFleetServiceRolePolicy** as the role name.

   d. Choose **Next**.
5. On the **Add permissions** page, choose **Next**.
6. On the **Name, review, and create** page, choose **Create role**.

To create the AWSServiceRoleForEC2SpotFleet role for Spot Fleet using the AWS CLI

Use the create-service-linked-role command as follows.

```
aws iam create-service-linked-role --aws-service-name spotfleet.amazonaws.com
```

If you no longer need to use Spot Fleet, we recommend that you delete the **AWSServiceRoleForEC2SpotFleet** role. After this role is deleted from your account, Amazon EC2 will create the role again if you request a Spot Fleet using the console. For more information, see Deleting a service-linked role in the *IAM User Guide*.

Grant access to CMKs for use with encrypted AMIs and EBS snapshots

If you specify an encrypted AMI or an encrypted Amazon EBS snapshot in your Spot Fleet request and you use a customer managed key for encryption, you must grant the **AWSServiceRoleForEC2SpotFleet** role permission to use the CMK so that Amazon EC2 can launch instances on your behalf. To do this, you must add a grant to the CMK, as shown in the following procedure.

When providing permissions, grants are an alternative to key policies. For more information, see Using Grants and Using Key Policies in AWS KMS in the *AWS Key Management Service Developer Guide*.

To grant the AWSServiceRoleForEC2SpotFleet role permissions to use the CMK

- Use the create-grant command to add a grant to the CMK and to specify the principal (the **AWSServiceRoleForEC2SpotFleet** service-linked role) that is given permission to perform the operations that the grant permits. The CMK is specified by the `key-id` parameter and the ARN of the CMK. The principal is specified by the `grantee-principal` parameter and the ARN of the **AWSServiceRoleForEC2SpotFleet** service-linked role.

  ```
  aws kms create-grant \
      --region us-east-1 \
      --key-id arn:aws-eusc:kms:us-
  east-1:444455556666:key/1234abcd-12ab-34cd-56ef-1234567890ab \
      --grantee-principal arn:aws-eusc:iam::111122223333:role/aws-service-role/
  spotfleet.amazonaws.com/AWSServiceRoleForEC2SpotFleet \
      --operations "Decrypt" "Encrypt" "GenerateDataKey"
   "GenerateDataKeyWithoutPlaintext" "CreateGrant" "DescribeKey" "ReEncryptFrom"
   "ReEncryptTo"
  ```

Service-linked role for Spot Instances

Amazon EC2 uses the service-linked role named **AWSServiceRoleForEC2Spot** to launch and manage Spot Instances on your behalf. For more information, see Service-linked role for Spot Instance requests.

IAM role for tagging a Spot Fleet

The `aws-ec2-spot-fleet-tagging-role` IAM role grants the Spot Fleet permission to tag the Spot Fleet request, instances, and volumes. For more information, see Tag a new or existing Spot Fleet request and the instances and volumes it launches.

> **Important**
>
> If you choose to tag instances in the fleet and you also choose to maintain target capacity (the Spot Fleet request is of type `maintain`), the differences in the permissions that are set for the user and the `IamFleetRole` might lead to inconsistent tagging behavior of instances in the fleet. If the `IamFleetRole` does not include the `CreateTags` permission, some of the instances launched by the fleet might not be tagged. While we are working to fix this inconsistency, to ensure that all instances launched by the fleet are tagged, we recommend that you use the `aws-ec2-spot-fleet-tagging-role` role for the `IamFleetRole`. Alternatively, to use an existing role, attach the `AmazonEC2SpotFleetTaggingRole` AWS Managed Policy to the existing role. Otherwise, you need to manually add the `CreateTags` permission to your existing policy.

To create the IAM role for tagging a Spot Fleet

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. Choose **Create role**.
4. On the **Select trusted entity** page, under **Trusted entity type**, choose **AWS service**.
5. Under **Use case**, from **Use cases for other AWS services**, choose **EC2**, and then choose **EC2 - Spot Fleet Tagging**.
6. Choose **Next**.
7. On the **Add permissions** page, choose **Next**.

8. On the **Name, review, and create** page, for **Role name**, enter a name for the role (for example, **aws-ec2-spot-fleet-tagging-role**).
9. Review the information on the page, and then choose **Create role**.

Cross-service confused deputy prevention

The confused deputy problem is a security issue where an entity that doesn't have permission to perform an action can coerce a more-privileged entity to perform the action. We recommend that you use the aws:SourceArn and aws:SourceAccount global condition context keys in the aws-ec2-spot-fleet-tagging-role trust policy to limit the permissions that Spot Fleet gives another service to the resource.

To add the aws:SourceArn and aws:SourceAccount condition keys to the aws-ec2-spot-fleet-tagging-role trust policy

1. Open the IAM console at https://eusc-de-east-1.console.amazonaws-eusc.eu/iam/.
2. In the navigation pane, choose **Roles**.
3. Find the aws-ec2-spot-fleet-tagging-role that you created previously and choose the link (not the checkbox).
4. Under **Summary**, choose the **Trust relationships** tab, and then choose **Edit trust policy**.
5. In the JSON statement, add a Condition element containing your aws:SourceAccount and aws:SourceArn global condition context keys to prevent the confused deputy problem, as follows:

```
"Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:aws-eusc:ec2:eusc-de-east-1:111122223333:spot-fleet-request/sfr-*"
      },
      "StringEquals": {
        "aws:SourceAccount": "111122223333"
      }
```

> **Note**
>
> If the aws:SourceArn value contains the account ID and you use both global condition context keys, the aws:SourceAccount value and the account in the

`aws:SourceArn` value must use the same account ID when used in the same policy statement.

The final trust policy will be as follows:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": {
    "Sid": "ConfusedDeputyPreventionExamplePolicy",
    "Effect": "Allow",
    "Principal": {
      "Service": "spotfleet.amazonaws.com"
    },
    "Action": "sts:AssumeRole",
    "Condition": {
      "ArnLike": {
        "aws:SourceArn": "arn:aws-eusc:ec2:eusc-de-east-1:111122223333:spot-
fleet-request/sfr-*"
      },
      "StringEquals": {
        "aws:SourceAccount": "111122223333"
      }
    }
  }
}
```

6. Choose **Update policy**.

The following table provides potential values for `aws:SourceArn` to limit the scope of the your `aws-ec2-spot-fleet-tagging-role` in varying degrees of specificity.

API operation	Called service	Scope	aws:SourceArn
RequestSpotFleet	AWS STS (`AssumeRole`)	Limit the `AssumeRole` capability on `aws-ec2-spot-`	`arn:aws-eusc:ec2:*:123456789`

API operation	Called service	Scope	aws:SourceArn
		fleet-tagging-role to spot-fleet-requests in the specified account.	*012* :spot-fleet-request/sfr-*
RequestSpotFleet	AWS STS (AssumeRole)	Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to spot-fleet-requests in the specified account and specified Region. Note that this role will not be usable in other Regions.	arn:aws-eusc:ec2: *us-east-1* :*123456789012* :spot-fleet-request/sfr-*
RequestSpotFleet	AWS STS (AssumeRole)	Limit the AssumeRole capability on aws-ec2-spot-fleet-tagging-role to only actions affecting the fleet sfr-11111111-1111-1111-1111-111111111111. Note that this role may not be usable for other Spot Fleets. Also, this role cannot be used to launch any new Spot Fleets through request-spot-fleet.	arn:aws-eusc:ec2: *us-east-1* :*123456789012* :spot-fleet-request/sfr-*11111111-1111-1111-1111-111111111111*

Create a Spot Fleet

> **Important**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

Using the AWS Management Console, you can quickly create a Spot Fleet request by choosing only an AMI and your desired total target capacity. Amazon EC2 will configure a fleet that best meets your needs and follows Spot best practices. Alternatively, you can modify any of the default settings.

If you want to include On-Demand Instances in your fleet, you must specify a launch template in your request and specify you desired On-Demand capacity.

The fleet launches On-Demand Instances when capacity is available, and launches Spot Instances when your maximum price exceeds the Spot price and capacity is available.

If your fleet includes Spot Instances and is of type `maintain`, Amazon EC2 will attempt to maintain your fleet target capacity when your Spot Instances are interrupted.

Required permissions

For more information, see the section called “Spot Fleet permissions”.

Tasks

- Quickly create a Spot Fleet request
- Create a Spot Fleet request using defined parameters
- Create a Spot Fleet that replaces unhealthy Spot Instances

Quickly create a Spot Fleet request

Follow these steps to quickly create a Spot Fleet request using the Amazon EC2 console.

To create a Spot Fleet request using the recommended settings

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Create Spot Fleet Request**.
4. Under **Launch parameters**, choose **Manually configure launch parameters**.
5. For **AMI**, choose an AMI.
6. Under **Target capacity**, for **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (GiB)**.
7. Under **Your fleet request at a glance**, review your fleet configuration, and choose **Launch**.

Create a Spot Fleet request using defined parameters

You can create a Spot Fleet by using parameters that you define.

Console

To create a Spot Fleet request using defined parameters

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. If you are new to Spot, you see a welcome page; choose **Get started**. Otherwise, choose **Create Spot Fleet Request**.
4. For **Launch parameters**, you can either manually configure the launch parameters or you can use a launch template, as follows:

   a. [Manually configure] To define the launch parameters in the Amazon EC2 console, choose **Manually configure launch parameters**, and then do the following:

      i. For **AMI**, choose one of the basic AMIs provided by AWS, or choose **Search for AMI** to use an AMI from our user community, the AWS Marketplace, or one of your own.

      > **Note**
      >
      > If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. For fleets that are set to maintain target capacity, the target capacity will not be maintained.

      ii. (Optional) For **Key pair name**, choose an existing key pair or create a new one.

[Existing key pair] Choose the key pair.

[New key pair] Choose **Create new key pair** to go the **Key pairs** page. When you are done, return to the **Spot Requests** page and refresh the list.

iii. (Optional) Expand **Additional launch parameters**, and do the following:

A. (Optional) To enable Amazon EBS optimization, for **EBS-optimized**, select **Launch EBS-optimized instances**.

B. (Optional) To add temporary block-level storage for your instances, for **Instance store**, choose **Attach at launch**.

C. (Optional) To add storage, choose **Add new volume**, and specify additional instance store volumes or Amazon EBS volumes, depending on the instance type.

D. (Optional) By default, basic monitoring is enabled for your instances. To enable detailed monitoring, for **Monitoring**, select **Enable CloudWatch detailed monitoring**.

E. (Optional) To run a Dedicated Spot Instance, for **Tenancy**, choose **Dedicated - run a dedicated instance**.

F. (Optional) For **Security groups**, choose one or more security groups or create a new one.

[Existing security group] Choose one or more security groups.

[New security group] Choose **Create new security group** to go the **Security Groups** page. When you are done, return to the **Spot Requests** and refresh the list.

G. (Optional) To make your instances reachable from the internet, for **Auto-assign IPv4 Public IP**, choose **Enable**.

H. (Optional) To launch your Spot Instances with an IAM role, for **IAM instance profile**, choose the role.

I. (Optional) To run a start-up script, copy it to **User data**.

J. (Optional) To add a tag, choose **Create tag** and enter the key and value for the tag, and choose **Create**. Repeat for each tag.

For each tag, to tag the instances and the Spot Fleet request with the same tag, ensure that both **Instances** and **Fleet** are selected. To tag only the instances launched by the fleet, clear **Fleet**. To tag only the Spot Fleet request, clear **Instances**.

b. [Launch template] To use a configuration you created in a launch template, choose **Use a launch template**, and for **Launch template**, choose a launch template.

> **Note**
>
> If you want On-Demand capacity in your Spot Fleet, you must specify a launch template.

5. For **Additional request details**, do the following:

   a. Review the additional request details. To make changes, clear **Apply defaults**.

   b. (Optional) For **IAM fleet role**, you can use the default role or choose a different role. To use the default role after changing the role, choose **Use default role**.

   c. (Optional) To create a request that is valid only during a specific time period, edit **Request valid from** and **Request valid until**.

   d. (Optional) By default, Amazon EC2 terminates your Spot Instances when the Spot Fleet request expires. To keep them running after your request expires, clear **Terminate the instances when the request expires**.

   e. (Optional) To register your Spot Instances with a load balancer, choose **Receive traffic from one or more load balancers** and choose one or more Classic Load Balancers or target groups.

6. For **Target capacity**, do the following:

   a. For **Total target capacity**, specify the number of units to request. For the type of unit, you can choose **Instances**, **vCPUs**, or **Memory (MiB)**. To specify a target capacity of 0 so that you can add capacity later, you must first select **Maintain target capacity**.

   b. (Optional) For **Include On-Demand base capacity**, specify the number of On-Demand units to request. The number must be less than the **Total target capacity**. Amazon EC2 calculates the difference, and allocates the difference to Spot units to request.

> **Important**
>
> To specify optional On-Demand capacity, you must first choose a launch template.

c. (Optional) By default, Amazon EC2 terminates Spot Instances when they are interrupted. To maintain the target capacity, select **Maintain target capacity**. You can then specify that Amazon EC2 terminates, stops, or hibernates Spot Instances when they are interrupted. To do so, choose the corresponding option from **Interruption behavior**.

> **Note**
>
> If an AMI specified in the launch parameters is deregistered or disabled, no new instances can be launched from the AMI. In this case, for fleets that are set to maintain target capacity, the target capacity will not be maintained.

d. (Optional) To allow Spot Fleet to launch a replacement Spot Instance when an instance rebalance notification is emitted for an existing Spot Instance in the fleet, select **Capacity rebalance**, and then choose an instance replacement strategy. If you choose **Launch before terminate**, specify the delay (in seconds) before Amazon EC2 terminates the old instances. For more information, see Use Capacity Rebalancing in EC2 Fleet and Spot Fleet to replace at-risk Spot Instances.

e. (Optional) To control the amount you pay per hour for all the Spot Instances in your fleet, select **Set maximum cost for Spot Instances** and then enter the maximum total amount you're willing to pay per hour. When the maximum total amount is reached, Spot Fleet stops launching Spot Instances even if it hasn't met the target capacity. For more information, see Set a spending limit for your EC2 Fleet or Spot Fleet.

7. For **Network**, do the following:

a. For **Network**, choose an existing VPC or create a new one.

[Existing VPC] Choose the VPC.

[New VPC] Choose **Create new VPC** to go the Amazon VPC console. When you're done, return to this screen and refresh the list.

b. (Optional) For **Availability Zone**, let Amazon EC2 choose the Availability Zones for your Spot Instances, or specify one or more Availability Zones.

   If you have more than one subnet in an Availability Zone, choose the appropriate subnet from **Subnet**. To add subnets, choose **Create new subnet** to go to the Amazon VPC console. When you are done, return to this screen and refresh the list.

8. For **Instance type requirements**, you can either specify instance attributes and let Amazon EC2 identify the optimal instance types with these attributes, or you can specify a list of instances. For more information, see Specify attributes for instance type selection for EC2 Fleet or Spot Fleet.

   a. If you choose **Specify instance attributes that match your compute requirements**, specify your instance attributes as follows:

      i. For **vCPUs**, enter the desired minimum and maximum number of vCPUs. To specify no limit, select **No minimum** or **No maximum**, or both.

      ii. For **Memory (GiB)**, enter the desired minimum and maximum amount of memory. To specify no limit, select **No minimum** or **No maximum**, or both.

      iii. (Optional) For **Additional instance attribute**, you can optionally specify one or more attributes to express your compute requirements in more detail. Each additional attribute adds a further constraint to your request. You can omit the additional attributes; when omitted, the default values are used. For a description of each attribute and their default values, see get-spot-placement-scores.

      iv. (Optional) To view the instance types with your specified attributes, expand **Preview matching instance types**. To exclude instance types from being used in your request, select the instances and then choose **Exclude selected instance types**.

   b. If you choose **Manually select instance types**, Spot Fleet provides a default list of instance types. To select more instance types, choose **Add instance types**, select the instance types to use in your request, and choose **Select**. To delete instance types, select the instance types and choose **Delete**.

9. For **Allocation strategy**, choose a Spot allocation strategy and an On-Demand allocation strategy that meets your needs. For more information, see Use allocation strategies to determine how EC2 Fleet or Spot Fleet fulfills Spot and On-Demand capacity.

10. For **Your fleet request at a glance**, review your fleet configuration, and make any adjustments if necessary.

11. (Optional) To download a copy of the launch configuration for use with the AWS CLI, choose **JSON config**.
12. When you're ready to launch your Spot Fleet, choose **Launch**.

    The Spot Fleet request type is `fleet`. When the request is fulfilled, requests of type `instance` are added, where the state is `active` and the status is `fulfilled`.

AWS CLI

To create a Spot Fleet request

Use the request-spot-fleet command.

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://config.json
```

For example configuration files, see Example CLI configurations Spot Fleet.

PowerShell

To create a Spot Fleet request

Use the Request-EC2SpotFleet cmdlet. The following example launches Spot Instances in a capacity-optimized fleet.

```
Request-EC2SpotFleet `
    -SpotFleetRequestConfig_TargetCapacity 50 `
    -SpotFleetRequestConfig_AllocationStrategy "CapacityOptimized" `
    -SpotFleetRequestConfig_IamFleetRole "arn:aws-eusc:iam::123456789012:role/my-spot-fleet-role" `
    -SpotFleetRequestConfig_LaunchTemplateConfig @($launchConfig)
```

Define the launch configuration as follows, setting the launch template and override properties that you need. For example configurations, see Example CLI configurations Spot Fleet.

```
$lcSpec = Amazon.EC2.Model.FleetLaunchTemplateSpecification
# To do - Set FleetLaunchTemplateSpecification properties
$lcOverrides = New-Object Amazon.EC2.Model.LaunchTemplateOverrides
# To do - Set LaunchTemplateOverrides properties
$launchConfig = New-Object Amazon.EC2.Model.LaunchTemplateConfig
$launchConfig.LaunchTemplateSpecification $lcSpec
$launchConfig.Overrides @($lcOverrides)
```

Create a Spot Fleet that replaces unhealthy Spot Instances

Spot Fleet checks the health status of the Spot Instances in the fleet every two minutes. The health status of an instance is either `healthy` or `unhealthy`.

Spot Fleet determines the health status of an instance by using the status checks provided by Amazon EC2. An instance is determined as `unhealthy` when the status of either the instance status check or the system status check is `impaired` for three consecutive health checks. For more information, see Status checks for Amazon EC2 instances.

You can configure your fleet to replace unhealthy Spot Instances. After enabling health check replacement, a Spot Instance is replaced when it is reported as `unhealthy`. The fleet could go below its target capacity for up to a few minutes while an unhealthy Spot Instance is being replaced.

Requirements

- Health check replacement is supported only for Spot Fleets that maintain a target capacity (fleets of type `maintain`), not for one-time Spot Fleets (fleets of type `request`).
- Health check replacement is supported only for Spot Instances. This feature is not supported for On-Demand Instances.
- You can configure your Spot Fleet to replace unhealthy instances only when you create it.
- Users can use health check replacement only if they have permission to call the `ec2:DescribeInstanceStatus` action.

Console

To configure a Spot Fleet to replace unhealthy Spot Instances

1. Follow the steps for creating a Spot Fleet in Create a Spot Fleet request using defined parameters.
2. To configure the fleet to replace unhealthy Spot Instances, expand **Additional launch parameters**, and under **Health check**, select **Replace unhealthy instances**. To enable this option, you must first choose **Maintain target capacity**.

AWS CLI

To configure a Spot Fleet to replace unhealthy Spot Instances

Use the request-spot-fleet command with the `ReplaceUnhealthyInstances` property of `SpotFleetRequestConfig`.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "lowestPrice",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-role",
        "TargetCapacity": 10,
        "ReplaceUnhealthyInstances": true
    }
}
```

PowerShell

To configure a Spot Fleet request to replace unhealthy Spot Instances

Use the Request-EC2SpotFleet cmdlet with the `-SpotFleetRequestConfig_ReplaceUnhealthyInstance` parameter.

```
-SpotFleetRequestConfig_ReplaceUnhealthyInstance $true
```

Tag a new or existing Spot Fleet request and the instances and volumes it launches

Important

Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

To help categorize and manage your Spot Fleet requests and the instances and volumes that it launches, you can tag them with custom metadata. You can assign a tag to a Spot Fleet request when you create it, or afterward. Similarly, you can assign a tag to the instances and volumes when they're launched by the fleet, or afterward.

When you tag a fleet request, the instances and volumes that are launched by the fleet are not automatically tagged. You need to explicitly tag the instances and volumes launched by the fleet.

You can choose to assign tags to only the fleet request, or to only the instances launched by the fleet, or to only the volumes attached to the instances launched by the fleet, or to all of them.

> **Note**
>
> You can only tag volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.

You can assign tags using the Amazon EC2 console or a command line tool.

For more information about how tags work, see Tag your Amazon EC2 resources.

Contents

- Prerequisite
- Tag a new Spot Fleet and the instances and volumes that it launches
- Tag an existing Spot Fleet
- View Spot Fleet request tags

Prerequisite

Grant the user the permission to tag resources. For more information, see Example: Tag resources.

To grant a user the permission to tag resources

Create an IAM policy that includes the following:

- The `ec2:CreateTags` action. This grants the user permission to create tags.
- The `ec2:RequestSpotFleet` action. This grants the user permission to create a Spot Fleet request.
- For `Resource`, you must specify `"*"`. This allows users to tag all resource types.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
```

```
            "Sid": "TagSpotFleetRequest",
            "Effect": "Allow",
            "Action": [
                "ec2:CreateTags",
                "ec2:RequestSpotFleet"
            ],
            "Resource": "*"
        }
    ]
}
```

Important

Resource-level permissions are not currently supported for the `spot-fleet-request` resource. If you specify `spot-fleet-request` as a resource, you will get an unauthorized exception when you try to tag the fleet. The following example illustrates how *not* to set the policy.

```
{
    "Effect": "Allow",
    "Action": [
        "ec2:CreateTags",
        "ec2:RequestSpotFleet"
    ],
    "Resource": "arn:aws-eusc:ec2:us-east-1:111122223333:spot-fleet-request/*"
}
```

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.
- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:

- Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
- (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

Tag a new Spot Fleet and the instances and volumes that it launches

To tag a new Spot Fleet request and the instances and volumes that it launches using the console

1. Follow the Create a Spot Fleet request using defined parameters procedure.
2. The way you add a tag depends on whether you manually configured the fleet or used a launch template.

   - If you manually configured the fleet, do the following:

     To add a tag, expand **Additional launch parameters**, choose **Create tag**, and enter the key and value for the tag. Repeat for each tag.

     For each tag, you can tag the Spot Fleet request and the instances with the same tag. To tag both, ensure that both **Instances** and **Fleet** are selected. To tag only the Spot Fleet request, clear **Instances**. To tag only the instances launched by the fleet, clear **Fleet**.

     > **Note**
     >
     > When you manually configure a fleet, there is no option to tag volumes. Volume tags are only supported for volumes that are attached to On-Demand Instances. When you manually configure a fleet, you can't specify On-Demand Instances.

   - If you used a launch template, do the following:

     To add a tag to the fleet request, under **Tags**, choose **Create Tag**, and enter the key and value for the tag. Repeat for each tag.

     To tag the resources in your fleet, you must specify tags in the launch template.

To tag a new Spot Fleet request and the instances and volumes that it launches using the AWS CLI

To tag a Spot Fleet request when you create it, and to tag the instances and volumes when they are launched by the fleet, configure the Spot Fleet request configuration as follows:

Spot Fleet request tags:

- Specify the tags for the Spot Fleet request in `SpotFleetRequestConfig`.
- For `ResourceType`, specify `spot-fleet-request`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

Instance tags:

- Specify the tags for the instances in `LaunchSpecifications`.
- For `ResourceType`, specify `instance`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

  Alternatively, you can specify the tags for the instance in the launch template that is referenced in the Spot Fleet request.

Volume tags:

- Specify the tags for the volumes in the launch template that is referenced in the Spot Fleet request. Volume tagging in `LaunchSpecifications` is not supported.

In the following example, the Spot Fleet request is tagged with two tags: Key=Environment and Value=Production, and Key=Cost-Center and Value=123. The instances that are launched by the fleet are tagged with one tag (which is the same as one of the tags for the Spot Fleet request): Key=Cost-Center and Value=123.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::111122223333:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchSpecifications": [
            {
                "ImageId": "ami-0123456789EXAMPLE",
```

```
                "InstanceType": "c4.large",
                "TagSpecifications": [
                    {
                        "ResourceType": "instance",
                        "Tags": [
                            {
                                "Key": "Cost-Center",
                                "Value": "123"
                            }
                        ]
                    }
                ]
            }
        ],
        "SpotPrice": "5",
        "TargetCapacity": 2,
        "TerminateInstancesWithExpiration": true,
        "Type": "maintain",
        "ReplaceUnhealthyInstances": true,
        "InstanceInterruptionBehavior": "terminate",
        "InstancePoolsToUseCount": 1,
        "TagSpecifications": [
            {
                "ResourceType": "spot-fleet-request",
                "Tags": [
                    {
                        "Key": "Environment",
                        "Value":"Production"
                    },
                    {
                        "Key": "Cost-Center",
                        "Value":"123"
                    }
                ]
            }
        ]
    }
}
```

To tag instances launched by a Spot Fleet using the AWS CLI

To tag instances when they are launched by the fleet, you can either specify the tags in the launch template that is referenced in the Spot Fleet request, or you can specify the tags in the Spot Fleet request configuration as follows:

- Specify the tags for the instances in `LaunchSpecifications`.
- For `ResourceType`, specify `instance`. If you specify another value, the fleet request will fail.
- For `Tags`, specify the key-value pair. You can specify more than one key-value pair.

In the following example, the instances that are launched by the fleet are tagged with one tag: Key=Cost-Center and Value=123.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "ExcessCapacityTerminationPolicy": "default",

To tag volumes attached to On-Demand Instances launched by a Spot Fleet using the AWS CLI

To tag volumes when they are created by the fleet, you must specify the tags in the launch template that is referenced in the Spot Fleet request.

> **Note**
>
> Volume tags are only supported for volumes that are attached to On-Demand Instances. You can't tag volumes that are attached to Spot Instances.
> Volume tagging in `LaunchSpecifications` is not supported.

Tag an existing Spot Fleet

To tag an existing Spot Fleet request using the console

After you create a Spot Fleet request, you can add tags to the fleet request using the console.

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Tags** tab and choose **Create Tag**.

To tag an existing Spot Fleet request using the AWS CLI

You can use the create-tags command to tag existing resources. In the following example, the existing Spot Fleet request is tagged with Key=purpose and Value=test.

```
aws ec2 create-tags \
    --resources sfr-11112222-3333-4444-5555-66666EXAMPLE \
    --tags Key=purpose,Value=test
```

View Spot Fleet request tags

To view Spot Fleet request tags using the console

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request and choose the **Tags** tab.

To describe Spot Fleet request tags

Use the describe-tags command to view the tags for the specified resource. In the following example, you describe the tags for the specified Spot Fleet request.

```
aws ec2 describe-tags \
    --filters "Name=resource-id,Values=sfr-11112222-3333-4444-5555-66666EXAMPLE"
```

```
{
    "Tags": [
        {
            "Key": "Environment",
            "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
            "ResourceType": "spot-fleet-request",
            "Value": "Production"
        },
        {
            "Key": "Another key",
            "ResourceId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
            "ResourceType": "spot-fleet-request",
            "Value": "Another value"
        }
    ]
}
```

You can also view the tags of a Spot Fleet request by describing the Spot Fleet request.

Use the describe-spot-fleet-requests command to view the configuration of the specified Spot Fleet request, which includes any tags that were specified for the fleet request.

```
aws ec2 describe-spot-fleet-requests \
```

```
    --spot-fleet-request-ids sfr-11112222-3333-4444-5555-66666EXAMPLE
```

```
{
    "SpotFleetRequestConfigs": [
        {
            "ActivityStatus": "fulfilled",
            "CreateTime": "2020-02-13T02:49:19.709Z",
            "SpotFleetRequestConfig": {
                "AllocationStrategy": "capacityOptimized",
                "OnDemandAllocationStrategy": "lowestPrice",
                "ExcessCapacityTerminationPolicy": "Default",
                "FulfilledCapacity": 2.0,
                "OnDemandFulfilledCapacity": 0.0,
                "IamFleetRole": "arn:aws-eusc:iam::111122223333:role/aws-ec2-spot-
fleet-tagging-role",
                "LaunchSpecifications": [
                    {
                        "ImageId": "ami-0123456789EXAMPLE",
                        "InstanceType": "c4.large"
                    }
                ],
                "TargetCapacity": 2,
                "OnDemandTargetCapacity": 0,
                "Type": "maintain",
                "ReplaceUnhealthyInstances": false,
                "InstanceInterruptionBehavior": "terminate"
            },
            "SpotFleetRequestId": "sfr-11112222-3333-4444-5555-66666EXAMPLE",
            "SpotFleetRequestState": "active",
            "Tags": [
                {
                    "Key": "Environment",
                    "Value": "Production"
                },
                {
                    "Key": "Another key",
                    "Value": "Another value"
                }
            ]
        }
    ]
}
```

Describe a Spot Fleet request, its instances, and event history

> **Important**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

You can describe your Spot Fleet configuration, the instances in your Spot Fleet, and the event history of your Spot Fleet.

Console

To describe your Spot Fleet

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request. The ID begins with **sfr-**. To see the configuration details, choose **Description**.
4. To list the Spot Instances for the Spot Fleet, choose **Instances**.
5. To view the history for the Spot Fleet, choose **History**.

AWS CLI

To describe your Spot Fleet request

Use the describe-spot-fleet-requests command.

```
aws ec2 describe-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

To describe the running instances for the specified Spot Fleet request

Use the describe-spot-fleet-instances command.

```
aws ec2 describe-spot-fleet-instances \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE
```

To describe the event history for the specified Spot Fleet request

Use the describe-spot-fleet-request-history command.

```
aws ec2 describe-spot-fleet-request-history \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --start-time 2024-05-18T00:00:00Z
```

PowerShell

To describe your Spot Fleet request

Use the Get-EC2SpotFleetRequest cmdlet.

```
Get-EC2SpotFleetRequest
```

To describe the running instances for the specified Spot Fleet request

Use the Get-EC2SpotFleetInstance cmdlet.

```
Get-EC2SpotFleetInstance `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE"
```

To describe the event history for the specified Spot Fleet request

Use the Get-EC2SpotFleetRequestHistory cmdlet.

```
Get-EC2SpotFleetRequestHistory `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -UtcStartTime 2024-05-18T00:00:00Z
```

Modify a Spot Fleet request

Important

Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

You can modify an active Spot Fleet request to complete the following tasks:

- Increase the total target capacity and On-Demand portion
- Decrease the total target capacity and On-Demand portion

When you increase the total target capacity, the Spot Fleet launches additional Spot Instances according to the allocation strategy for its Spot Fleet request. When you increase the On-Demand portion, the Spot Fleet launches additional On-Demand Instances.

When you decrease the total target capacity, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet reaches the new target capacity. If the allocation strategy is `diversified`, the Spot Fleet terminates instances across the pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

Considerations

- You can't modify a one-time Spot Fleet request. You can only modify a Spot Fleet request if you selected **Maintain target capacity** when you created the Spot Fleet request.
- When a Spot Fleet terminates an instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Console

To modify a Spot Fleet request

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions**, **Modify target capacity**.
5. In **Modify target capacity**, do the following:
   a. Enter the new target capacity and On-Demand portion.
   b. (Optional) If you are decreasing the target capacity but want to keep the fleet at its current size, clear **Terminate instances**.
   c. Choose **Submit**.

AWS CLI

To modify a Spot Fleet request

Use the modify-spot-fleet-request command to update the target capacity of the specified Spot Fleet request.

```
aws ec2 modify-spot-fleet-request \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --target-capacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
aws ec2 modify-spot-fleet-request \
    --spot-fleet-request-id sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --target-capacity 10 \
    --excess-capacity-termination-policy NoTermination
```

PowerShell

To modify a Spot Fleet request

Use the Edit-EC2SpotFleetRequest cmdlet to update the target capacity of the specified Spot Fleet request.

```
Edit-EC2SpotFleetRequest `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TargetCapacity 20
```

You can modify the previous command as follows to decrease the target capacity of the specified Spot Fleet without terminating any Spot Instances as a result.

```
Edit-EC2SpotFleetRequest `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TargetCapacity 20 `
    -ExcessCapacityTerminationPolicy "NoTermination"
```

Cancel (delete) a Spot Fleet request

Important

Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

If you no longer require a Spot Fleet, you can cancel the Spot Fleet request, which deletes the request. After you cancel a fleet request, all Spot requests associated with the fleet are also canceled, so that no new Spot Instances are launched.

When you cancel a Spot Fleet request, you must also specify if you want to terminate all of its instances. These include both On-Demand Instances and Spot Instances.

Warning

Terminating an instance is permanent and irreversible.
After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

If you specify that the instances must be terminated when the fleet request is canceled, the fleet request enters the `cancelled_terminating` state. Otherwise, it enters the `cancelled_running` state, and the instances continue to run until they are interrupted or you terminate them manually.

Restrictions

- You can cancel up to 100 fleets in a single request. If you exceed the specified number, no fleets are canceled.

Console

To cancel (delete) a Spot Fleet request

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose **Actions**, **Cancel request**.
5. In the **Cancel Spot request** dialog box, do the following:
   a. To terminate the associated instances at the same time as canceling the Spot Fleet request, leave the **Terminate instances** checkbox selected. To cancel the Spot Fleet request without terminating the associated instances, clear the **Terminate instances** checkbox.
   b. Choose **Confirm**.

AWS CLI

To cancel (delete) a Spot Fleet request and terminate its instances

Use the cancel-spot-fleet-requests command with the `--terminate-instances` option.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --terminate-instances
```

The following is example output.

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_terminating",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

To cancel (delete) a Spot Fleet request without terminating its instances

Modify the previous example by using the `--no-terminate-instances` option instead.

```
aws ec2 cancel-spot-fleet-requests \
    --spot-fleet-request-ids sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE \
    --no-terminate-instances
```

The following is example output.

```
{
    "SuccessfulFleetRequests": [
        {
            "SpotFleetRequestId": "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE",
            "CurrentSpotFleetRequestState": "cancelled_running",
            "PreviousSpotFleetRequestState": "active"
        }
    ],
    "UnsuccessfulFleetRequests": []
}
```

PowerShell

To cancel (delete) a Spot Fleet request and terminate its instances

Use the Stop-EC2SpotFleetRequest cmdlet with the `-TerminateInstance` parameter.

```
Stop-EC2SpotFleetRequest `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TerminateInstance $true
```

To cancel (delete) a Spot Fleet request without terminating its instances

Modify the previous example by changing the value of the `-TerminateInstance` parameter.

```
Stop-EC2SpotFleetRequest `
    -SpotFleetRequestId "sfr-73fbd2ce-aa30-494c-8788-1cee4EXAMPLE" `
    -TerminateInstance $false
```

Understand automatic scaling for Spot Fleet

> **Important**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

Automatic scaling enables your Spot Fleet to increase or decrease its target capacity based on demand. With automatic scaling, a Spot Fleet can either launch instances (scale out) or terminate instances (scale in) within a specified range, in response to one or more scaling policies.

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling.

Types of automatic scaling

Spot Fleet supports the following types of automatic scaling:

- Target tracking scaling – Increase or decrease the current capacity of the fleet by targeting a value for a specific metric. This is similar to the way that your thermostat maintains the temperature of your home—you select the desired temperature and the thermostat does the rest.
- Step scaling – Increase or decrease the current capacity of the fleet based on a set of scaling adjustments, known as step adjustments, that vary based on the size of the alarm breach.
- Scheduled scaling – Increase or decrease the current capacity of the fleet based on the date and time.

Considerations

When using automatic scaling for your Spot Fleet, consider the following:

- **Instance weighting** – If you're using instance weighting, keep in mind that Spot Fleet can exceed the target capacity as needed. Fulfilled capacity can be a floating-point number but target capacity must be an integer, so Spot Fleet rounds up to the next integer. You must take

these behaviors into account when you look at the outcome of a scaling policy when an alarm is triggered. For example, suppose that the target capacity is 30, the fulfilled capacity is 30.1, and the scaling policy subtracts 1. When the alarm is triggered, the automatic scaling process subtracts 1 from 30.1 to get 29.1 and then rounds it up to 30, so no scaling action is taken. As another example, suppose that you selected instance weights of 2, 4, and 8, and a target capacity of 10, but no weight 2 instances were available so Spot Fleet provisioned instances of weights 4 and 8 for a fulfilled capacity of 12. If the scaling policy decreases target capacity by 20% and an alarm is triggered, the automatic scaling process subtracts 12*0.2 from 12 to get 9.6 and then rounds it up to 10, so no scaling action is taken.

- **Cooldown period** – The scaling policies that you create for Spot Fleet support a cooldown period. This is the number of seconds after a scaling activity completes where previous trigger-related scaling activities can influence future scaling events. For scale-out policies, while the cooldown period is in effect, the capacity that has been added by the previous scale-out event that initiated the cooldown is calculated as part of the desired capacity for the next scale out. The intention is to continuously (but not excessively) scale out. For scale in policies, the cooldown period is used to block subsequent scale in requests until it has expired. The intention is to scale in conservatively to protect your application's availability. However, if another alarm triggers a scale-out policy during the cooldown period after a scale-in, automatic scaling scales out your scalable target immediately.
- **Use detailed monitoring** – We recommend that you scale based on instance metrics with a 1-minute frequency because that ensures a faster response to utilization changes. Scaling on metrics with a 5-minute frequency can result in slower response time and scaling on stale metric data. To send metric data for your instances to CloudWatch in 1-minute periods, you must specifically enable detailed monitoring. For more information, see Manage detailed monitoring for your EC2 instances and Create a Spot Fleet request using defined parameters.
- **AWS CLI** – If you use the AWS CLI for configuring scaling for Spot Fleet, you'll use the application-autoscaling commands.

IAM permissions required for Spot Fleet automatic scaling

Automatic scaling for Spot Fleet is made possible by a combination of the Amazon EC2, Amazon CloudWatch, and Application Auto Scaling APIs. Spot Fleet requests are created with Amazon EC2, alarms are created with CloudWatch, and scaling policies are created with Application Auto Scaling. In addition to the IAM permissions required for using Spot Fleet and Amazon EC2, the user that accesses the fleet scaling settings must have the appropriate permissions for the services that support automatic scaling.

To use automatic scaling for Spot Fleet, users must have permissions to use the actions shown in the following example policy.

JSON

```
{
    "Version":"2012-10-17",
    "Statement": [
        {
            "Effect": "Allow",
            "Action": [
                "application-autoscaling:*",
                "ec2:DescribeSpotFleetRequests",
                "ec2:ModifySpotFleetRequest",
                "cloudwatch:DeleteAlarms",
                "cloudwatch:DescribeAlarmHistory",
                "cloudwatch:DescribeAlarms",
                "cloudwatch:DescribeAlarmsForMetric",
                "cloudwatch:GetMetricStatistics",
                "cloudwatch:ListMetrics",
                "cloudwatch:PutMetricAlarm",
                "cloudwatch:DisableAlarmActions",
                "cloudwatch:EnableAlarmActions",
                "iam:CreateServiceLinkedRole",
                "sns:CreateTopic",
                "sns:Subscribe",
                "sns:Get*",
                "sns:List*"
            ],
            "Resource": "*"
        }
    ]
}
```

You can also create your own IAM policies that allow more fine-grained permissions for calls to the Application Auto Scaling API. For more information, see Identity and Access Management for Application Auto Scaling in the *Application Auto Scaling User Guide*.

The Application Auto Scaling service also needs permission to describe your Spot Fleet and CloudWatch alarms, and permissions to modify your Spot Fleet target capacity on your behalf. If you enable automatic scaling for your Spot Fleet, it creates a service-linked role named

`AWSServiceRoleForApplicationAutoScaling_EC2SpotFleetRequest`. This service-linked role grants Application Auto Scaling permission to describe the alarms for your policies, to monitor the current capacity of the fleet, and to modify the capacity of the fleet. The original managed Spot Fleet role for Application Auto Scaling was `aws-ec2-spot-fleet-autoscale-role`, but it is no longer required. The service-linked role is the default role for Application Auto Scaling. For more information, see Service-linked roles for Application Auto Scaling in the *Application Auto Scaling User Guide*.

Target tracking scaling: Scale Spot Fleet by targeting a value for a specific metric

With target tracking scaling, you create a target tracking scaling policy by selecting a metric and setting a target value. Spot Fleet then creates and manages the CloudWatch alarms that trigger the scaling policy, and calculates the scaling adjustment based on the chosen metric and target value. The scaling policy adjusts capacity by adding or removing instances as needed to keep the metric at, or close to, the specified target value. A target tracking policy not only keeps the metric close to the target value, but also adjusts to the fluctuations in the metric due to a fluctuating load pattern and minimizes rapid capacity fluctuations.

You can create multiple target tracking scaling policies for a Spot Fleet, provided each policy uses a different metric. The fleet scales based on the policy that specifies the largest fleet capacity. This allows you to cover multiple scenarios to ensure sufficient capacity for your application workloads.

To ensure application availability, the fleet scales out proportionally to the metric as fast as it can, but scales in more gradually.

When a Spot Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

> **Note**
>
> Do not edit or delete the CloudWatch alarms that Spot Fleet manages for a target tracking scaling policy. Spot Fleet deletes the alarms automatically when you delete the target tracking scaling policy.

Prerequisites

- The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`.

- Configure the IAM permissions required for Spot Fleet automatic scaling.
- Review the Considerations.

To configure a target tracking policy

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Auto Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Auto Scaling** section.
5. If automatic scaling is not configured, choose **Configure**.
6. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Automatic scaling does not scale your fleet below the minimum capacity or above the maximum capacity.
7. For **Policy name**, enter a name for the policy.
8. Choose a **Target metric**.
9. Enter a **Target value** for the metric.
10. For **Cooldown period**, specify a new value (in seconds) or keep the default.
11. (Optional) To omit creating a scale-in policy based on the current configuration, select **Disable scale-in**. You can create a scale-in policy using a different configuration.
12. Choose **Save**.

To configure a target tracking policy using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the register-scalable-target command.
2. Create a scaling policy using the put-scaling-policy command.

Step scaling: Scale Spot Fleet using step scaling policies

With step scaling policies, you specify CloudWatch alarms to trigger the scaling process. For example, if you want to scale out when CPU utilization reaches a certain level, create an alarm using the CPU`Utilization` metric provided by Amazon EC2.

When you create a step scaling policy, you must specify one of the following scaling adjustment types:

- **Add** – Increase the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Remove** – Decrease the target capacity of the fleet by a specified number of capacity units or a specified percentage of the current capacity.
- **Set to** – Set the target capacity of the fleet to the specified number of capacity units.

When an alarm is triggered, the automatic scaling process calculates the new target capacity using the fulfilled capacity and the scaling policy, and then updates the target capacity accordingly. For example, suppose that the target capacity and fulfilled capacity are 10 and the scaling policy adds 1. When the alarm is triggered, the automatic scaling process adds 1 to 10 to get 11, so Spot Fleet launches 1 instance.

When a Spot Fleet terminates a Spot Instance because the target capacity was decreased, the instance receives a Spot Instance interruption notice.

Prerequisites

- The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`.
- Configure the IAM permissions required for Spot Fleet automatic scaling.
- Consider which CloudWatch metrics are important to your application. You can create CloudWatch alarms based on metrics provided by AWS or your own custom metrics.
- For the AWS metrics that you will use in your scaling policies, enable CloudWatch metrics collection if the service that provides the metrics does not enable it by default.
- Review the Considerations.

To create a CloudWatch alarm

1. Open the CloudWatch console at https://eusc-de-east-1.console.amazonaws-eusc.eu/cloudwatch/.
2. In the navigation pane, expand **Alarms** and choose **All alarms**.
3. Choose **Create alarm**.
4. On the **Specify metric and conditions** page, choose **Select metric**.

5. Choose **EC2 Spot**, then **Fleet Request Metrics**, and then select a metric (for example, **TargetCapacity**), and then choose **Select metric**.

   The **Specify metric and conditions** page appears, showing a graph and other information about the metric you selected.

6. For **Period**, choose the evaluation period for the alarm, for example, **1 minute**. When evaluating the alarm, each period is aggregated into one data point.

   > **Note**
   >
   > A shorter period creates a more sensitive alarm.

7. For **Conditions**, define the alarm by defining the threshold condition. For example, you can define a threshold to trigger the alarm whenever the value of the metric is greater than or equal to 80 percent.
8. Under **Additional configuration**, for **Datapoints to alarm**, specify how many datapoints (evaluation periods) must be in the ALARM state to trigger the alarm, for example, 1 evaluation period or 2 out of 3 evaluation periods. This creates an alarm that goes to ALARM state if that many consecutive periods are breaching. For more information, see Evaluating an alarm in the *Amazon CloudWatch User Guide*.
9. For **Missing data treatment**, choose one of the options (or leave the default of **Treat missing data as missing**). For more information, see Configuring how CloudWatch alarms treat missing data in the *Amazon CloudWatch User Guide*.
10. Choose **Next**.
11. (Optional) To receive notification of a scaling event, for **Notification**, you can choose or create the Amazon SNS topic you want to use to receive notifications. Otherwise, you can delete the notification now and add one later as needed.
12. Choose **Next**.
13. Under **Add name and description**, enter a name and description for the alarm and choose **Next**.
14. Choose **Create alarm**.

To configure a step scaling policy for your Spot Fleet

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Auto Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Auto Scaling** section.
5. If automatic scaling is not configured, choose **Configure**.
6. Use **Scale capacity between** to set the minimum and maximum capacity for your fleet. Scaling policies do not scale your fleet below the minimum capacity or above the maximum capacity.
7. Under **Scaling policies**, for **Policy type**, choose **Step scaling policy**.
8. Initially, **Scaling policies** contain step scaling policies named **ScaleUp** and **ScaleDown**. You can complete these policies, or choose **Remove policy** to delete them. You can also choose **Add policy**.
9. To define a policy, do the following:

    a. For **Policy name**, enter a name for the policy.

    b. For **Policy trigger**, select an existing alarm, or choose **Create alarm** to open the Amazon CloudWatch console and create an alarm.

    c. For **Modify capacity**, define the amount by which to scale and the lower and upper bound of the step adjustment. You can add or remove a specific number of instances or a percentage of the existing fleet size, or set the fleet to an exact size.

    For example, to create a step scaling policy that increases the capacity of the fleet by 30 percent, choose **Add**, enter **30** in the next field, and then choose **percent**. By default, the lower bound for an add policy is the alarm threshold and the upper bound is positive (+) infinity. By default, the upper bound for a remove policy is the alarm threshold and the lower bound is negative (-) infinity.

    d. (Optional) To add another step, choose **Add step**.

    e. For **Cooldown period**, specify a new value (in seconds) or keep the default.
10. Choose **Save**.

To configure step scaling policies for your Spot Fleet using the AWS CLI

1. Register the Spot Fleet request as a scalable target using the register-scalable-target command.
2. Create a scaling policy using the put-scaling-policy command.

3. Create an alarm that triggers the scaling policy using the put-metric-alarm command.

Scheduled scaling: Scale Spot Fleet on a schedule

Scaling your fleet on a schedule enables you to scale your application in response to predictable changes in demand. By creating *scheduled actions*, you can instruct Spot Fleet to perform scaling activities at specific times. To create a scheduled action, you must specify an existing Spot Fleet, the time when the scaling activity must occur, and the desired minimum and maximum capacity. Scheduled actions can be configured to scale once or on a recurring schedule. If you needs change, you can edit or delete scheduled actions.

Prerequisites

- Scheduled actions can only be created for existing Spot Fleets. You can't create a scheduled action when you create a Spot Fleet.
- The Spot Fleet request must have a request type of `maintain`. Automatic scaling is not supported for requests of type `request`.
- Configure the IAM permissions required for Spot Fleet automatic scaling.
- Review the Considerations.

To create a one-time scheduled action

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Scheduled Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Scheduled Scaling** section.
5. Choose **Create scheduled action**.
6. For **Name**, specify a name for the scheduled action.
7. Enter a value for **Minimum capacity**, **Maximum capacity**, or both.
8. For **Recurrence**, choose **Once**.
9. (Optional) Choose a date and time for **Start time**, **End time**, or both.
10. Choose **Create**.

To create a recurring scheduled action

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Scheduled Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Scheduled Scaling** section.
5. For **Name**, specify a name for the scheduled action.
6. Enter a value for **Minimum capacity**, **Maximum capacity**, or both.
7. For **Recurrence**, choose one of the predefined schedules (for example, **Every day**), or choose **Custom** and enter a cron expression. For more information about the cron expressions supported by scheduled scaling, see Cron expressions in the *Amazon EventBridge User Guide*.
8. (Optional) Choose a date and time for **Start time**, **End time**, or both.
9. Choose **Submit**.

To edit a scheduled action

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Scheduled Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Scheduled Scaling** section.
5. Select the scheduled action and choose **Actions**, **Edit**.
6. Make the needed changes and choose **Submit**.

To delete a scheduled action

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Spot Requests**.
3. Select your Spot Fleet request.
4. Choose the **Scheduled Scaling** tab near the bottom of the screen. If you selected the link for your Spot Fleet, there is no tab; instead, scroll down to the **Scheduled Scaling** section.
5. Select the scheduled action and choose **Actions**, **Delete**.

6. When prompted for confirmation, choose **Delete**.

To manage scheduled scaling using the AWS CLI

Use the following commands:

- put-scheduled-action
- describe-scheduled-actions
- delete-scheduled-action

Monitor your EC2 Fleet or Spot Fleet

Effective monitoring of your EC2 Fleet or Spot Fleet is essential for maintaining optimal performance and ensuring reliability. There are various tools to help you achieve this, including Amazon CloudWatch and Amazon EventBridge, which are covered in this topic.

With CloudWatch, you can collect and track metrics, set alarms, and automatically react to changes in your fleet's status.

With EventBridge, you can monitor and respond programmatically to events emitted by your fleet. By defining rules in EventBridge, you can automate responses to specific fleet events, such as instance termination or fleet state changes, improving your operational efficiency.

Topics

- Monitor your EC2 Fleet or Spot Fleet using CloudWatch
- Monitor and programmatically respond to the events emitted by your EC2 Fleet or Spot Fleet using Amazon EventBridge

Monitor your EC2 Fleet or Spot Fleet using CloudWatch

You can monitor your EC2 Fleet or Spot Fleet using the Amazon CloudWatch metrics described in this section.

> **Important**
>
> To ensure accuracy, we recommend that you enable detailed monitoring when using these metrics. For more information, see Manage detailed monitoring for your EC2 instances.

For more information about using CloudWatch, see Monitor your instances using CloudWatch.

EC2 Fleet and Spot Fleet metrics

The AWS/EC2Spot namespace includes the following metrics for your fleet, plus the CloudWatch metrics for the Spot Instances in your fleet. For more information, see Instance metrics.

Metric	Description
AvailableInstancePoolsCount	The Spot capacity pools specified in the fleet request. Units: Count
BidsSubmittedForCapacity	The capacity for which Amazon EC2 has submitted fleet requests. Units: Count
EligibleInstancePoolCount	The Spot capacity pools specified in the fleet request where Amazon EC2 can fulfill requests. Amazon EC2 does not fulfill requests in pools where the maximum price you're willing to pay for Spot Instances is less than the Spot price or the Spot price is greater than the price for On-Demand Instances. Units: Count
FulfilledCapacity	The capacity that Amazon EC2 has fulfilled. Units: Count
MaxPercentCapacityAllocation	The maximum value of PercentCapacityAllocation across all fleet pools specified in the fleet request. Units: Percent
PendingCapacity	The difference between TargetCapacity and FulfilledCapacity . Units: Count

Metric	Description
PercentCapacityAllocation	The capacity allocated for the Spot capacity pool for the specified dimensions. To get the maximum value recorded across all Spot capacity pools, use MaxPercentCapacityAllocation . Units: Percent
TargetCapacity	The target capacity of the fleet request. Units: Count
TerminatingCapacity	The capacity that is being terminated because the provisioned capacity is greater than the target capacity. Units: Count

If the unit of measure for a metric is Count, the most useful statistic is Average.

EC2 Fleet and Spot Fleet dimensions

To filter the data for your fleet, use the following dimensions.

Dimensions	Description
AvailabilityZone	Filter the data by Availability Zone.
FleetRequestId	Filter the data by fleet request.
InstanceType	Filter the data by instance type.

View the CloudWatch metrics for your EC2 Fleet or Spot Fleet

You can view the CloudWatch metrics for your fleet using the Amazon CloudWatch console. These metrics are displayed as monitoring graphs. These graphs show data points if the fleet is active.

Metrics are grouped first by namespace, and then by the various combinations of dimensions within each namespace. For example, you can view all fleet metrics or fleet metrics groups by fleet request ID, instance type, or Availability Zone.

To view fleet metrics

1. Open the CloudWatch console at https://eusc-de-east-1.console.amazonaws-eusc.eu/cloudwatch/.
2. In the navigation pane, expand **Metrics**, and choose **All metrics**.
3. Choose the **EC2 Spot** namespace.

   > **Note**
   >
   > If the **EC2 Spot** namespace is not displayed, there are two reasons for this. Either you have never used EC2 Fleet or Spot Fleet in the Region—only the AWS services that you're using send metrics to Amazon CloudWatch. Or, if you have used EC2 Fleet or Spot Fleet in the Region, but not for the past two weeks, the namespace does not appear.

4. To filter the metrics by dimension, choose one of the following:

   - **Fleet Request Metrics** – Group by fleet request
   - **By Availability Zone** – Group by fleet request and Availability Zone
   - **By Instance Type** – Group by fleet request and instance type
   - **By Availability Zone/Instance Type** – Group by fleet request, Availability Zone, and instance type

5. To view the data for a metric, select the checkbox next to the metric.

Monitor and programmatically respond to the events emitted by your EC2 Fleet or Spot Fleet using Amazon EventBridge

When the state of an EC2 Fleet or Spot Fleet changes, it emits a notification. The notification is made available as an event that is sent to Amazon EventBridge (formerly known as Amazon CloudWatch Events). Events are emitted on a best effort basis.

You can use Amazon EventBridge to create rules that trigger programmatic actions in response to an event. For example, you can create two EventBridge rules: one triggered when a fleet state

changes, and another triggered when an instance in the fleet is terminated. In this example, you can configure the first rule so that, if the fleet state changes, the rule invokes an SNS topic, sending an email notification to you. You can configure the second rule so that, if an instance in the fleet is terminated, the rule invokes a Lambda function to launch a new instance.

> **Note**
>
> Only fleets of type `maintain` and `request` emit events. Fleets of type `instant` do not emit events because they submit synchronous one-time requests, and the state of the fleet is known immediately in the response. To use Amazon EventBridge to monitor fleet events, the request type must be `maintain` or `request`.

For instructions on how to describe a fleet's event history, see Describe the event history for your EC2 Fleet.

Topics

- Create Amazon EventBridge rules to monitor EC2 Fleet or Spot Fleet events
- EC2 Fleet event types
- Spot Fleet event types

Create Amazon EventBridge rules to monitor EC2 Fleet or Spot Fleet events

When a state change notification is emitted for an EC2 Fleet or Spot Fleet, it is sent as an event to Amazon EventBridge as a JSON file. If EventBridge detects an event pattern that matches a pattern defined in a rule, EventBridge invokes the target (or targets) specified in the rule.

You can write EventBridge rules to automate actions based on matching event patterns.

The following fields in the event form the event pattern that is defined in the rule:

`"source": "aws.ec2fleet"`

Identifies that the event is from EC2 Fleet.

`"detail-type": "EC2 Fleet State Change"`

Identifies the event type.

```
"detail": { "sub-type": "submitted" }
```

Identifies the event sub-type.

For the list of EC2 Fleet and Spot Fleet events and example event data, see EC2 Fleet event types and Spot Fleet event types.

Examples

- Create an EventBridge rule to send a notification
- Create an EventBridge rule to trigger a Lambda function

Create an EventBridge rule to send a notification

The following example creates an EventBridge rule to send an email, text message, or mobile push notification every time that Amazon EC2 emits an EC2 Fleet state change notification. The signal in this example is emitted as an `EC2 Fleet State Change` event, which triggers the action defined by the rule.

Prerequisite

Before creating the EventBridge rule, you must create the Amazon SNS topic for the email, text message, or mobile push notification.

To create an EventBridge rule to send a notification when an EC2 Fleet state changes

1. Open the Amazon EventBridge console at https://eusc-de-east-1.console.amazonaws-eusc.eu/events/.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:
   a. Enter a **Name** for the rule, and, optionally, a description.

      A rule can't have the same name as another rule in the same Region and on the same event bus.
   b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.
   c. For **Rule type**, choose **Rule with an event pattern**.
   d. Choose **Next**.

4. For **Build event pattern**, do the following:

   a. For **Event source**, choose **AWS events or EventBridge partner events**.

   b. For **Event pattern**, for this example you'll specify the following event pattern to match the `EC2 Fleet Instance Change` event.

   ```
   {
    "source": ["aws.ec2fleet"],
    "detail-type": ["EC2 Fleet Instance Change"]
   }
   ```

   To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

   i. To use a template to create the event pattern, do the following:

      A. Choose **Event pattern form**.

      B. For **Event source**, choose **AWS services**.

      C. For **AWS Service**, choose **EC2 Fleet**.

      D. For **Event type**, choose **EC2 Fleet Instance Change**.

      E. To customize the template, choose **Edit pattern** and make your changes to match the example event pattern.

   ii. (Alternative) To specify a custom event pattern, do the following:

      A. Choose **Custom pattern (JSON editor)**.

      B. In the **Event pattern** box, add the event pattern for this example.

   c. Choose **Next**.

5. For **Select target(s)**, do the following:

   a. For **Target types**, choose **AWS service**.

   b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.

   c. For **Topic**, choose an existing topic. You first need to create an Amazon SNS topic using the Amazon SNS console. For more information, see Using Amazon SNS for application-to-person (A2P) messaging in the *Amazon Simple Notification Service Developer Guide*.

d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see Creating Amazon EventBridge rules that react to events (step 16) in the *Amazon EventBridge User Guide*.

e. Choose **Next**.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.

7. For **Review and create**, do the following:

   a. Review the details of the rule and modify them as necessary.

   b. Choose **Create rule**.

For more information, see Amazon EventBridge rules and Amazon EventBridge event patterns in the *Amazon EventBridge User Guide*

Create an EventBridge rule to trigger a Lambda function

The following example creates an EventBridge rule to trigger a Lambda function every time that Amazon EC2 emits an EC2 Fleet instance change notification for when an instance is launched. The signal in this example is emitted as an `EC2 Fleet Instance Change` event, sub-type `launched`, which triggers the action defined by the rule.

Before creating the EventBridge rule, you must create the Lambda function.

To create the Lambda function to use in the EventBridge rule

1. Open the AWS Lambda console at https://eusc-de-east-1.console.amazonaws-eusc.eu/lambda/.
2. Choose **Create function**.
3. Enter a name for your function, configure the code, and then choose **Create function**.

   For more information, see Create your first Lambda function in the *AWS Lambda Developer Guide*.

To create an EventBridge rule to trigger a Lambda function when an instance in an EC2 Fleet changes state

1. Open the Amazon EventBridge console at https://eusc-de-east-1.console.amazonaws-eusc.eu/events/.
2. Choose **Create rule**.
3. For **Define rule detail**, do the following:

   a. Enter a **Name** for the rule, and, optionally, a description.

      A rule can't have the same name as another rule in the same Region and on the same event bus.

   b. For **Event bus**, choose **default**. When an AWS service in your account generates an event, it always goes to your account's default event bus.

   c. For **Rule type**, choose **Rule with an event pattern**.

   d. Choose **Next**.

4. For **Build event pattern**, do the following:

   a. For **Event source**, choose **AWS events or EventBridge partner events**.

   b. For **Event pattern**, for this example you'll specify the following event pattern to match the `EC2 Fleet Instance Change` event and `launched` sub-type.

```
{
 "source": ["aws.ec2fleet"],
 "detail-type": ["EC2 Fleet Instance Change"],
 "detail": {
   "sub-type": ["launched"]
}
```

      To add the event pattern, you can either use a template by choosing **Event pattern form**, or specify your own pattern by choosing **Custom pattern (JSON editor)**, as follows:

      i. To use a template to create the event pattern, do the following:

         A. Choose **Event pattern form**.

         B. For **Event source**, choose **AWS services**.

         C. For **AWS Service**, choose **EC2 Fleet**.

D. For **Event type**, choose **EC2 Fleet Instance Change**.

E. Choose **Edit pattern**, and add `"detail": {"sub-type": ["launched"]` to match the example event pattern. For proper JSON format, insert a comma (`,`) after the preceding square bracket (`]`).

ii. (Alternative) To specify a custom event pattern, do the following:

A. Choose **Custom pattern (JSON editor)**.

B. In the **Event pattern** box, add the event pattern for this example.

c. Choose **Next**.

5. For **Select target(s)**, do the following:

a. For **Target types**, choose **AWS service**.

b. For **Select a target**, choose **SNS topic** to send an email, text message, or mobile push notification when the event occurs.

c. For **Topic**, choose **Lambda function**, and for **Function**, choose the function that you created to respond when the event occurs.

d. (Optional) Under **Additional settings**, you can optionally configure additional settings. For more information, see Creating Amazon EventBridge rules that react to events (step 16) in the *Amazon EventBridge User Guide*.

e. Choose **Next**.

6. (Optional) For **Tags**, you can optionally assign one or more tags to your rule, and then choose **Next**.

7. For **Review and create**, do the following:

a. Review the details of the rule and modify them as necessary.

b. Choose **Create rule**.

For a tutorial on how to create a Lambda function and an EventBridge rule that runs the Lambda function, see Tutorial: Log the State of an Amazon EC2 Instance Using EventBridge in the *AWS Lambda Developer Guide*.

EC2 Fleet event types

There are five EC2 Fleet event types. For each event type, there are several sub-types.

Event types

- EC2 Fleet State Change
- EC2 Fleet Spot Instance Request Change
- EC2 Fleet Instance Change
- EC2 Fleet Information
- EC2 Fleet Error

EC2 Fleet State Change

EC2 Fleet sends an `EC2 Fleet State Change` event to Amazon EventBridge when an EC2 Fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "715ed6b3-b8fc-27fe-fad6-528c7b8bf8a2",
    "detail-type": "EC2 Fleet State Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:20Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-
be4d-6b0809bfff0a"
    ],
    "detail": {
        "sub-type": "active"
    }
}
```

The possible values for `sub-type` are:

`active`

The EC2 Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

`deleted`

The EC2 Fleet request is deleted and has no running instances. The EC2 Fleet will be deleted two days after its instances are terminated.

`deleted_running`

The EC2 Fleet request is deleted and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

`deleted_terminating`

The EC2 Fleet request is deleted and its instances are terminating. The request remains in this state until all instances are terminated.

`expired`

The EC2 Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent `terminated` event indicates that the instances are terminated.

`modify_in_progress`

The EC2 Fleet request is being modified. The request remains in this state until the modification is fully processed.

`modify_succeeded`

The EC2 Fleet request was modified.

`submitted`

The EC2 Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

`progress`

The EC2 Fleet request is in the process of being fulfilled.

EC2 Fleet Spot Instance Request Change

EC2 Fleet sends an `EC2 Fleet Spot Instance Request Change` event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "19331f74-bf4b-a3dd-0f1b-ddb1422032b9",
```

```
    "detail-type": "EC2 Fleet Spot Instance Request Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:05Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:fleet/
fleet-83fd4e48-552a-40ef-9532-82a3acca5f10"
    ],
    "detail": {
        "spot-instance-request-id": "sir-rmqske6h",
        "description": "SpotInstanceRequestId sir-rmqske6h, PreviousState:
 cancelled_running",
        "sub-type": "cancelled"
    }
}
```

The possible values for `sub-type` are:

`active`

The Spot Instance request is fulfilled and has an associated Spot Instance.

`cancelled`

You cancelled the Spot Instance request, or the Spot Instance request expired.

`disabled`

You stopped the Spot Instance.

`submitted`

The Spot Instance request is submitted.

EC2 Fleet Instance Change

EC2 Fleet sends an `EC2 Fleet Instance Change` event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "542ce428-c8f1-0608-c015-e8ed6522c5bc",
```

```
    "detail-type": "EC2 Fleet Instance Change",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T09:00:23Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:fleet/fleet-598fb973-87b7-422d-
be4d-6b0809bfff0a"
    ],
    "detail": {
        "instance-id": "i-0c594155dd5ff1829",
        "description": "{\"instanceType\":\"c5.large\",\"image\":\"ami-6057e21a\",
\"productDescription\":\"Linux/UNIX\",\"availabilityZone\":\"us-east-1d\"}",
        "sub-type": "launched"
    }
}
```

The possible values for `sub-type` are:

`launched`

A new instance was launched.

`terminated`

The instance was terminated.

`termination_notified`

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Fleet Information

EC2 Fleet sends an `EC2 Fleet Information` event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
```

```
    "id": "76529817-d605-4571-7224-d36cc1b2c0c4",
    "detail-type": "EC2 Fleet Information",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-11-09T08:17:07Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:fleet/fleet-8becf5fe-
bb9e-415d-8f54-3fa5a8628b91"
    ],
    "detail": {
        "description": "c4.xlarge, ami-0947d2ba12ee1ff75, Linux/UNIX, us-east-1a,
 Spot price in either SpotFleetRequestConfigData or SpotFleetLaunchSpecification or
 LaunchTemplate or LaunchTemplateOverrides is less than Spot market price $0.0619",
        "sub-type": "launchSpecUnusable"
    }
}
```

The possible values for `sub-type` are:

`fleetProgressHalted`

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

`launchSpecTemporarilyBlacklisted`

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

`launchSpecUnusable`

The price in a launch specification is not valid because it is below the Spot price.

`registerWithLoadBalancersFailed`

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Fleet Error

EC2 Fleet sends an `EC2 Fleet Error` event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
    "id": "69849a22-6d0f-d4ce-602b-b47c1c98240e",
    "detail-type": "EC2 Fleet Error",
    "source": "aws.ec2fleet",
    "account": "123456789012",
    "time": "2020-10-07T01:44:24Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:fleet/fleet-9bb19bc6-60d3-4fd2-ae47-
d33e68eafa08"
    ],
    "detail": {
        "description": "m3.large, ami-00068cd7555f543d5, Linux/UNIX: IPv6 is not
 supported for the instance type 'm3.large'. ",
        "sub-type": "spotFleetRequestConfigurationInvalid"
    }
}
```

The possible values for `sub-type` are:

`iamFleetRoleInvalid`

The EC2 Fleet does not have the required permissions to either launch or terminate an instance.

`allLaunchSpecsTemporarilyBlacklisted`

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

`spotInstanceCountLimitExceeded`

You've reached the limit on the number of Spot Instances that you can launch.

`spotFleetRequestConfigurationInvalid`

The configuration is not valid. For more information, see the description of the event.

Spot Fleet event types

> **Note**
>
> Spot Fleet uses a legacy API with no planned investment. We recommend using EC2 Fleet or an Auto Scaling group instead. For more information, see Which is the best fleet method to use?.

There are five Spot Fleet event types. For each event type, there are several sub-types.

Event types

- EC2 Spot Fleet State Change
- EC2 Spot Fleet Spot Instance Request Change
- EC2 Spot Fleet Instance Change
- EC2 Spot Fleet Information
- EC2 Spot Fleet Error

EC2 Spot Fleet State Change

Spot Fleet sends an `EC2 Spot Fleet State Change` event to Amazon EventBridge when a Spot Fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "d1af1091-6cc3-2e24-203a-3b870e455d5b",
    "detail-type": "EC2 Spot Fleet State Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T08:57:06Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:spot-fleet-request/
sfr-4b6d274d-0cea-4b2c-b3be-9dc627ad1f55"
    ],
    "detail": {
        "sub-type": "submitted"
```

```
    }
}
```

The possible values for `sub-type` are:

`active`

The Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.

`cancelled`

The Spot Fleet request is canceled and has no running instances. The Spot Fleet will be deleted two days after its instances are terminated.

`cancelled_running`

The Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

`cancelled_terminating`

The Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.

`expired`

The Spot Fleet request has expired. If the request was created with `TerminateInstancesWithExpiration` set, a subsequent `terminated` event indicates that the instances are terminated.

`modify_in_progress`

The Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.

`modify_succeeded`

The Spot Fleet request was modified.

`submitted`

The Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.

`progress`

The Spot Fleet request is in the process of being fulfilled.

EC2 Spot Fleet Spot Instance Request Change

Spot Fleet sends an `EC2 Spot Fleet Spot Instance Request Change` event to Amazon EventBridge when a Spot Instance request in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "cd141ef0-14af-d670-a71d-fe46e9971bd2",
    "detail-type": "EC2 Spot Fleet Spot Instance Request Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T08:53:21Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:spot-fleet-request/sfr-
a98d2133-941a-47dc-8b03-0f94c6852ad1"
    ],
    "detail": {
        "spot-instance-request-id": "sir-a2w9gc5h",
        "description": "SpotInstanceRequestId sir-a2w9gc5h, PreviousState:
 cancelled_running",
        "sub-type": "cancelled"
    }
}
```

The possible values for `sub-type` are:

`active`

The Spot Instance request is fulfilled and has an associated Spot Instance.

`cancelled`

You cancelled the Spot Instance request, or the Spot Instance request expired.

`disabled`

You stopped the Spot Instance.

`submitted`

The Spot Instance request is submitted.

EC2 Spot Fleet Instance Change

Spot Fleet sends an `EC2 Spot Fleet Instance Change` event to Amazon EventBridge when an instance in the fleet changes state.

The following is example data for this event.

```
{
    "version": "0",
    "id": "11591686-5bd7-bbaa-eb40-d46529c2710f",
    "detail-type": "EC2 Spot Fleet Instance Change",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T07:25:02Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:spot-fleet-request/sfr-c8a764a4-
bedc-4b62-af9c-0095e6e3ba61"
    ],
    "detail": {
        "instance-id": "i-08b90df1e09c30c9b",
        "description": "{\"instanceType\":\"r4.2xlarge\",\"image\":
\"ami-032930428bf1abbff\",\"productDescription\":\"Linux/UNIX\",\"availabilityZone\":
\"us-east-1a\"}",
        "sub-type": "launched"
    }
}
```

The possible values for `sub-type` are:

`launched`

A new instance was launched.

`terminated`

The instance was terminated.

`termination_notified`

An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

EC2 Spot Fleet Information

Spot Fleet sends an `EC2 Spot Fleet Information` event to Amazon EventBridge when there is an error during fulfillment. The information event does not block the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
    "id": "73a60f70-3409-a66c-635c-7f66c5f5b669",
    "detail-type": "EC2 Spot Fleet Information",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-08T20:56:12Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:spot-fleet-request/sfr-2531ea06-
af18-4647-8757-7d69c94971b1"
    ],
    "detail": {
        "description": "r3.8xlarge, ami-032930428bf1abbff, Linux/UNIX, us-east-1a, Spot
 bid price is less than Spot market price $0.5291",
        "sub-type": "launchSpecUnusable"
    }
}
```

The possible values for `sub-type` are:

`fleetProgressHalted`

The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced `launchSpecUnusable` events). A launch specification might become valid if the Spot price changes.

`launchSpecTemporarilyBlacklisted`

The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.

`launchSpecUnusable`

The price in a launch specification is not valid because it is below the Spot price.

`registerWithLoadBalancersFailed`

An attempt to register instances with load balancers failed. For more information, see the description of the event.

EC2 Spot Fleet Error

Spot Fleet sends an `EC2 Spot Fleet Error` event to Amazon EventBridge when there is an error during fulfillment. The error event blocks the fleet from attempting to fulfil its target capacity.

The following is example data for this event.

```
{
    "version": "0",
    "id": "10adc4e7-675c-643e-125c-5bfa1b1ba5d2",
    "detail-type": "EC2 Spot Fleet Error",
    "source": "aws.ec2spotfleet",
    "account": "123456789012",
    "time": "2020-11-09T06:56:07Z",
    "region": "us-east-1",
    "resources": [
        "arn:aws-eusc:ec2:us-east-1:123456789012:spot-fleet-request/
sfr-38725d30-25f1-4f30-83ce-2907c56dba17"
    ],
    "detail": {
        "description": "r4.2xlarge, ami-032930428bf1abbff, Linux/UNIX: The
 associatePublicIPAddress parameter can only be specified for the network interface
 with DeviceIndex 0. ",
        "sub-type": "spotFleetRequestConfigurationInvalid"
    }
}
```

The possible values for `sub-type` are:

`iamFleetRoleInvalid`

The Spot Fleet does not have the required permissions to either launch or terminate an instance.

`allLaunchSpecsTemporarilyBlacklisted`

None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.

`spotInstanceCountLimitExceeded`

You've reached the limit on the number of Spot Instances that you can launch.

`spotFleetRequestConfigurationInvalid`

The configuration is not valid. For more information, see the description of the event.

Tutorials for EC2 Fleet

There are different ways to configure an EC2 Fleet. The configuration you choose depends on your specific use case.

The following tutorials cover some of the possible use cases and provide the tasks required to implement them.

Use case	Link to tutorial
Use instance weighting to manage the availability and performance of your EC2 Fleet. With instance weighting, you assign a weight to each instance type in your EC2 Fleet to represent their compute capacity and performance relative to each other. Based on the weights, the fleet can use any combinati on of the specified instance types, as long as it can fulfil the desired target capacity.	Tutorial: Configure EC2 Fleet to use instance weighting

Use case	Link to tutorial
Use On-Demand capacity to ensure availability during peak periods, but benefit from additional Spot capacity at a lower cost. Configure your EC2 Fleet to use On-Demand Instances as the primary capacity to ensure available capacity during peak periods. In addition, allocate some capacity to Spot Instances to benefit from discounted pricing, while keeping in mind that Spot Instances can be interrupted if Amazon EC2 needs the capacity back.	Tutorial: Configure EC2 Fleet to use On-Demand Instances as the primary capacity
Use Capacity Reservations to reserve compute capacity for your On-Demand Instances. Configure your EC2 Fleet to use `targeted` Capacity Reservations first when launching On-Demand Instances. If you have strict capacity requirements, and are running business-critical workloads that require a certain level of long or short-term capacity assurance, we recommend that you create a Capacity Reservation to ensure that you always have access to Amazon EC2 capacity when you need it, for as long as you need it.	Tutorial: Configure EC2 Fleet to launch On-Demand Instances using targeted Capacity Reservations
Use Capacity Blocks to reserve highly sought-after GPU instances for your ML workloads. Configure your EC2 Fleet to launch instances into Capacity Blocks.	Tutorial: Configure your EC2 Fleet to launch instances into Capacity Blocks

Use case	Link to tutorial
Use a single Capacity Reservation Resource Group to launch instances into multiple Capacity Reservation types. Configure your EC2 Fleet to launch instances across multiple Capacity Reservation types – On-Demand Capacity Reservations, Capacity Blocks for ML, and interruptible Capacity Reservations – using a single Capacity Reservation Resource Group. You can prioritize the Capacity Reservation types in a specific order, and optionally fall back to On-Demand capacity when reserved capacity is insufficient to meet your target.	Tutorial: Configure your EC2 Fleet to launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group

Tutorial: Configure EC2 Fleet to use instance weighting

This tutorial uses a fictitious company called Example Corp to illustrate the process of requesting an EC2 Fleet using instance weighting.

Objective

Example Corp, a pharmaceutical company, wants to use the computational power of Amazon EC2 for screening chemical compounds that might be used to fight cancer.

Planning

Example Corp first reviews Spot Best Practices. Next, Example Corp determines the requirements for their EC2 Fleet.

Instance types

Example Corp has a compute- and memory-intensive application that performs best with at least 60 GB of memory and eight virtual CPUs (vCPUs). They want to maximize these resources for the application at the lowest possible price. Example Corp decides that any of the following EC2 instance types would meet their needs:

Instance type	Memory (GiB)	vCPUs
r3.2xlarge	61	8
r3.4xlarge	122	16
r3.8xlarge	244	32

Target capacity in units

With instance weighting, target capacity can equal a number of instances (the default) or a combination of factors such as cores (vCPUs), memory (GiBs), and storage (GBs). By considering the base for their application (60 GB of RAM and eight vCPUs) as one unit, Example Corp decides that 20 times this amount would meet their needs. So the company sets the target capacity of their EC2 Fleet request to 20 units.

Instance weights

After determining the target capacity, Example Corp calculates instance weights. To calculate the instance weight for each instance type, they determine the units of each instance type that are required to reach the target capacity as follows:

- r3.2xlarge (61.0 GB, 8 vCPUs) = 1 unit of 20
- r3.4xlarge (122.0 GB, 16 vCPUs) = 2 units of 20
- r3.8xlarge (244.0 GB, 32 vCPUs) = 4 units of 20

Therefore, Example Corp assigns instance weights of 1, 2, and 4 to the respective launch configurations in their EC2 Fleet request.

Price per unit hour

Example Corp uses the On-Demand price per instance hour as a starting point for their price. They could also use recent Spot prices, or a combination of the two. To calculate the price per unit hour, they divide their starting price per instance hour by the weight. For example:

Instance type	On-Demand price	Instance weight	Price per unit hour
r3.2xLarge	$0.7	1	$0.7
r3.4xLarge	$1.4	2	$0.7
r3.8xLarge	$2.8	4	$0.7

Example Corp could use a global price per unit hour of $0.7 and be competitive for all three instance types. They could also use a global price per unit hour of $0.7 and a specific price per unit hour of $0.9 in the `r3.8xlarge` launch specification.

Verify permissions

Before creating an EC2 Fleet, Example Corp verifies that it has an IAM role with the required permissions. For more information, see EC2 Fleet prerequisites.

Create a launch template

Next, Example Corp creates a launch template. The launch template ID is used in the following step. For more information, see Create an Amazon EC2 launch template.

Create the EC2 Fleet

Example Corp creates a file, `config.json`, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-07b3bc7625cdab851",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r3.2xlarge",
                    "SubnetId": "subnet-482e4972",
```

```
                    "WeightedCapacity": 1
                },
                {
                    "InstanceType": "r3.4xlarge",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 2
                },
                {
                    "InstanceType": "r3.8xlarge",
                    "MaxPrice": "0.90",
                    "SubnetId": "subnet-482e4972",
                    "WeightedCapacity": 4
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example Corp creates the EC2 Fleet using the following create-fleet command.

```
aws ec2 create-fleet --cli-input-json file://config.json
```

For more information, see Create an EC2 Fleet.

Fulfillment

The allocation strategy determines which Spot capacity pools your Spot Instances come from.

With the `lowest-price` strategy (which is the default strategy), the Spot Instances come from the pool with the lowest price per unit at the time of fulfillment. To provide 20 units of capacity, the EC2 Fleet launches either 20 `r3.2xlarge` instances (20 divided by 1), 10 `r3.4xlarge` instances (20 divided by 2), or 5 `r3.8xlarge` instances (20 divided by 4).

If Example Corp used the `diversified` strategy, the Spot Instances would come from all three pools. The EC2 Fleet would launch 6 `r3.2xlarge` instances (which provide 6 units), 3 `r3.4xlarge` instances (which provide 6 units), and 2 `r3.8xlarge` instances (which provide 8 units), for a total of 20 units.

Tutorial: Configure EC2 Fleet to use On-Demand Instances as the primary capacity

This tutorial uses a fictitious company called ABC Online to illustrate the process of requesting an EC2 Fleet with On-Demand as the primary capacity, and Spot capacity if available.

Objective

ABC Online, a restaurant delivery company, aims to provision Amazon EC2 capacity across EC2 instance types and purchasing options to achieve their desired scale, performance, and cost.

Plan

ABC Online requires a fixed capacity to handle peak periods, but would like to benefit from additional capacity at a lower cost. The company determines the following requirements for their EC2 Fleet:

- On-Demand Instance capacity – ABC Online requires 15 On-Demand Instances to ensure that they can accommodate traffic at peak periods.
- Spot Instance capacity – To enhance performance, but at a lower price, ABC Online plans to provision 5 Spot Instances.

Verify permissions

Before creating an EC2 Fleet, ABC Online verifies that it has an IAM role with the required permissions. For more information, see EC2 Fleet prerequisites.

Create a launch template

Next, ABC Online creates a launch template. The launch template ID is used in the following step. For more information, see Create an Amazon EC2 launch template.

Create the EC2 Fleet

ABC Online creates a file, `config.json`, with the following configuration for its EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

```
{
    "LaunchTemplateConfigs": [
```

```
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-07b3bc7625cdab851",
                "Version": "2"
            }

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 20,
        "OnDemandTargetCapacity":15,
        "DefaultTargetCapacityType": "spot"
    }
}
```

ABC Online creates the EC2 Fleet using the following create-fleet command.

```
aws ec2 create-fleet --cli-input-json file://config.json
```

For more information, see Create an EC2 Fleet.

Fulfillment

The allocation strategy determines that the On-Demand capacity is always fulfilled, while the balance of the target capacity is fulfilled as Spot if there is available capacity.

Tutorial: Configure EC2 Fleet to launch On-Demand Instances using targeted Capacity Reservations

This tutorial walks you through all the steps that you must perform so that your EC2 Fleet launches On-Demand Instances into `targeted` Capacity Reservations.

You will learn how to configure a fleet to use `targeted` On-Demand Capacity Reservations first when launching On-Demand Instances. You will also learn how to configure the fleet so that, when the total On-Demand target capacity exceeds the number of available unused Capacity Reservations, the fleet uses the specified allocation strategy for selecting the instance pools in which to launch the remaining target capacity.

EC2 Fleet configuration

In this tutorial, the fleet is configured as follows:

- Target capacity: 10 On-Demand Instances
- Total unused `targeted` Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

  Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

To launch On-Demand Instances into targeted Capacity Reservations, you must perform a number of steps, as follows:

- Step 1: Create Capacity Reservations
- Step 2: Create a Capacity Reservation resource group
- Step 3: Add the Capacity Reservations to the Capacity Reservation resource group
- (Optional) Step 4: View the Capacity Reservations in the resource group
- Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group
- (Optional) Step 6: Describe the launch template
- Step 7: Create an EC2 Fleet
- (Optional) Step 8: View the number of remaining unused Capacity Reservations

Step 1: Create Capacity Reservations

Use the create-capacity-reservation command to create the Capacity Reservations, three for `us-east-1a` and another three for `us-east-1b`. Except for the Availability Zone, the other attributes of the Capacity Reservations are identical.

3 Capacity Reservations in `us-east-1a`

```
aws ec2 create-capacity-reservation \
    --availability-zone us-east-1a \
    --instance-type c5.xlarge \
```

```
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-1234567890abcdef1
```

3 Capacity Reservations in `us-east-1b`

```
aws ec2 create-capacity-reservation \
    --availability-zone us-east-1b \
    --instance-type c5.xlarge \
    --instance-platform Linux/UNIX \
    --instance-count 3 \
    --instance-match-criteria targeted
```

Example of resulting Capacity Reservation ID

```
cr-54321abcdef567890
```

Step 2: Create a Capacity Reservation resource group

Use the `resource-groups` service and the create-group command to create a Capacity Reservation resource group. In this example, the resource group is named `my-cr-group`. For information about why you must create a resource group, see Use Capacity Reservations to reserve On-Demand capacity in EC2 Fleet.

```
aws resource-groups create-group \
    --name my-cr-group \
    --configuration '{"Type":"AWS::EC2::CapacityReservationPool"}'
 '{"Type":"AWS::ResourceGroups::Generic", "Parameters": [{"Name": "allowed-resource-
types", "Values": ["AWS::EC2::CapacityReservation"]}]}'
```

Step 3: Add the Capacity Reservations to the Capacity Reservation resource group

Use the `resource-groups` service and the group-resources command to add the Capacity Reservations that you created in Step 1 to the Capacity Reservations resource group. Note that you must reference the On-Demand Capacity Reservations by their ARNs.

```
aws resource-groups group-resources \
    --group my-cr-group \
    --resource-arns \
      arn:aws-eusc:ec2:us-east-1:123456789012:capacity-reservation/cr-1234567890abcdef1
 \
      arn:aws-eusc:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890
```

Example output

```
{
   "Failed": [],
   "Succeeded": [
   "arn:aws-eusc:ec2:us-east-1:123456789012:capacity-reservation/
cr-1234567890abcdef1",
   "arn:aws-eusc:ec2:us-east-1:123456789012:capacity-reservation/cr-54321abcdef567890"
   ]
}
```

(Optional) Step 4: View the Capacity Reservations in the resource group

Use the `resource-groups` service and the list-group-resources command to optionally describe the resource group to view its Capacity Reservations.

```
aws resource-groups list-group-resources --group my-cr-group
```

Example output

```
{
    "ResourceIdentifiers": [
        {
            "ResourceType": "AWS::EC2::CapacityReservation",
            "ResourceArn": "arn:aws-eusc:ec2:us-east-1:123456789012:capacity-
reservation/cr-1234567890abcdef1"
        },
        {
            "ResourceType": "AWS::EC2::CapacityReservation",
            "ResourceArn": "arn:aws-eusc:ec2:us-east-1:123456789012:capacity-
reservation/cr-54321abcdef567890"
        }
    ]
}
```

Step 5: Create a launch template that specifies that the Capacity Reservation targets a specific resource group

Use the create-launch-template command to create a launch template in which to specify the Capacity Reservations to use. In this example, the fleet will use `targeted` Capacity Reservations, which have been added to a resource group. Therefore, the launch template data specifies that the Capacity Reservation targets a specific resource group. In this example, the launch template is named `my-launch-template`.

```
aws ec2 create-launch-template \
    --launch-template-name my-launch-template \
    --launch-template-data \
        '{"ImageId": "ami-0123456789example",
          "CapacityReservationSpecification":
            {"CapacityReservationTarget":
                { "CapacityReservationResourceGroupArn": "arn:aws-eusc:resource-
groups:us-east-1:123456789012:group/my-cr-group" }
            }
        }'
```

(Optional) Step 6: Describe the launch template

Use the describe-launch-template-versions command to optionally describe the launch template to view its configuration.

```
aws ec2 describe-launch-template-versions --launch-template-name my-launch-template
```

Example output

```
{
    "LaunchTemplateVersions": [
        {
            "LaunchTemplateId": "lt-01234567890example",
            "LaunchTemplateName": "my-launch-template",
            "VersionNumber": 1,
            "CreateTime": "2021-01-19T20:50:19.000Z",
            "CreatedBy": "arn:aws-eusc:iam::123456789012:user/Admin",
            "DefaultVersion": true,
            "LaunchTemplateData": {
                "ImageId": "ami-0947d2ba12ee1ff75",
                "CapacityReservationSpecification": {
```

```
                    "CapacityReservationTarget": {
                        "CapacityReservationResourceGroupArn": "arn:aws-eusc:resource-
groups:us-east-1:123456789012:group/my-cr-group"
                    }
                }
            }
        }
    ]
}
```

Step 7: Create an EC2 Fleet

Create an EC2 Fleet that specifies the configuration information for the instances that it will launch. The following EC2 Fleet configuration shows only the pertinent configurations for this example. The launch template `my-launch-template` is the launch template you created in Step 5. There are two instance pools, each with the same instance type (`c5.xlarge`), but with different Availability Zones (`us-east-1a` and `us-east-1b`). The price of the instance pools is the same because pricing is defined for the Region, not per Availability Zone. The total target capacity is 10, and the default target capacity type is `on-demand`. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

> **Note**
>
> The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
               {
                   "InstanceType": "c5.xlarge",
                   "AvailabilityZone": "us-east-1a"
               },
```

```
                {
                     "InstanceType": "c5.xlarge",
                     "AvailabilityZone": "us-east-1b"
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 10,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price",
        "CapacityReservationOptions": {
             "UsageStrategy": "use-capacity-reservations-first"
         }
    },
    "Type": "instant"
}
```

After you create the `instant` fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` `targeted` Capacity Reservations in `us-east-1a`
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` `targeted` Capacity Reservations in `us-east-1b`
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is `lowest-price` in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

(Optional) Step 8: View the number of remaining unused Capacity Reservations

After the fleet is launched, you can optionally run describe-capacity-reservations to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{ "CapacityReservationId":  "cr-111",
     "InstanceType":  "c5.xlarge",
     "AvailableInstanceCount":  0
}

 { "CapacityReservationId":  "cr-222",
     "InstanceType":  "c5.xlarge",
     "AvailableInstanceCount":  0
}
```

Tutorial: Configure your EC2 Fleet to launch instances into Capacity Blocks

This tutorial walks you through the steps that you must perform so that your EC2 Fleet launches instances into Capacity Blocks.

In most cases, the target capacity of the EC2 Fleet request should be less than or equal to the available capacity of the Capacity Block reservation that you are targeting. Target capacity requests that exceed the limits of the Capacity Block reservation will not be fulfilled. If the target capacity request exceeds the limits of your Capacity Block reservation, you will receive an `Insufficient Capacity Exception` for the capacity that exceeds the limits of your Capacity Block reservation.

> **Note**
>
> For Capacity Blocks, EC2 Fleet will not fallback to launching On-Demand Instances for the remainder of the desired target capacity.

If EC2 Fleet is unable to fulfill the requested target capacity in an available Capacity Block reservation, EC2 Fleet will fulfill as much capacity as it can and return the instances that it was able to launch. You can repeat the call to EC2 Fleet again until all the instances are provisioned.

After configuring the EC2 Fleet request, you must wait until the start date of your Capacity Block reservation. If you make requests to EC2 Fleet to launch into a Capacity Block that hasn't started yet, you will receive an `Insufficient Capacity Error`.

After your Capacity Block reservation becomes active, you can make EC2 Fleet API calls and provision the instances into your Capacity Block based on the parameters you selected. Instances

running in the Capacity Block continue to run until you manually stop or terminate them or until Amazon EC2 terminates the instances when the Capacity Block reservation ends.

For more information about Capacity Blocks, see Capacity Blocks for ML.

Considerations

- Only EC2 Fleet requests of type `instant` are supported for launching instances into Capacity Blocks. For more information, see Configure an EC2 Fleet of type instant.
- Multiple Capacity Blocks in the same EC2 Fleet request aren't supported.
- Using `OnDemandTargetCapacity` or `SpotTargetCapacity` while also setting `capacity-block` as the `DefaultTargetCapacity` isn't supported.
- If `DefaultTargetCapacityType` is set to `capacity-block`, you can't provide `OnDemandOptions::CapacityReservationOptions`. An exception will occur.

To configure an EC2 Fleet to launch instances into Capacity Blocks

1. **Create a launch template.**

   In the launch template, do the following:

   - For `InstanceMarketOptionsRequest`, set `MarketType` to `capacity-block`.
   - To target the Capacity Block reservation, for `CapacityReservationID`, specify the Capacity Block reservation ID.

   Make note of launch template name and version. You'll use this information in the next step.

   For more information about creating a launch template, see Create an Amazon EC2 launch template.

2. **Configure the EC2 Fleet.**

   Create a file, `config.json`, with the following configuration for your EC2 Fleet. In the following example, replace the resource identifiers with your own resource identifiers.

   For more information about configuring an EC2 Fleet, see Create an EC2 Fleet.

```
{
    "LaunchTemplateConfigs": [
```

```
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "CBR-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "p5.48xlarge",
                    "AvailabilityZone": "us-east-1a"
                },
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 10,
        "DefaultTargetCapacityType": "capacity-block"
    },
    "Type": "instant"
}
```

3. **Launch the fleet.**

   Use the following create-fleet command.

   ```
   aws ec2 create-fleet --cli-input-json file://config.json
   ```

   For more information, see Create an EC2 Fleet.

Tutorial: Configure your EC2 Fleet to launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group

This tutorial walks you through the steps to configure an EC2 Fleet that launches instances across multiple Capacity Reservation types – On-Demand Capacity Reservations (ODCRs), Capacity Blocks for ML, and interruptible Capacity Reservations – using a single Capacity Reservation Resource Group.

You will learn how to create a Capacity Reservation Resource Group that contains different Capacity Reservation types, configure your EC2 Fleet to prioritize the Capacity Reservation types

in a specific order, and optionally fall back to On-Demand capacity when reserved capacity is insufficient to meet your target.

Considerations

- Only EC2 Fleet requests of type `instant` are supported when using `ReservedCapacityOptions`.
- You must explicitly specify which Capacity Reservation types to target in the `ReservationTypes` list. EC2 Fleet launches instances only into the Capacity Reservation types that you specify.
- `ReservedCapacityOptions` is mutually exclusive with `OnDemandOptions.CapacityReservationOptions`. You can't use both in the same EC2 Fleet request.

This tutorial assumes that you already have the following Capacity Reservations in your account:

- An ODCR (`cr-1234567890abcdef1`) for `p5.48xlarge` in `us-east-1a`
- An ODCR (`cr-abcdef1234567890a`) for `p4d.24xlarge` in `us-east-1b`
- A Capacity Block (`cr-0123456789abcdef0`) for `p5.48xlarge` in `us-east-1a`
- An interruptible Capacity Reservation (`cr-9876543210fedcba9`) for `p5.48xlarge` in `us-east-1a`, shared with you by another account in your organization

Verify permissions

Before creating an EC2 Fleet, verify that you have an IAM role with the required permissions. For more information, see EC2 Fleet prerequisites.

Step 1: Create a Capacity Reservation Resource Group

Create a Capacity Reservation Resource Group to hold the Capacity Reservations that your EC2 Fleet targets. Configure the group so that it accepts Capacity Reservations of any instance type and Capacity Reservation type, which allows the group to hold a mix of Capacity Reservation types. For step-by-step instructions, see Capacity Reservation groups.

Note

When you create the group, do not specify the `instance-type` or `reservation-type` parameters in the `AWS::EC2::CapacityReservationPool` configuration. Omitting these parameters allows the group to accept Capacity Reservations of any instance type and Capacity Reservation type.

Step 2: Add Capacity Reservations to the group

Add your Capacity Reservations to the Capacity Reservation Resource Group. You can add any combination of ODCRs, Capacity Blocks for ML, interruptible Capacity Reservations, and UltraServer Capacity Blocks. For this tutorial, add the four Capacity Reservations listed at the beginning of this tutorial. For step-by-step instructions, see Capacity Reservation groups.

Step 3: Create a launch template

Use the create-launch-template command to create a launch template that targets the Capacity Reservation Resource Group. When you use `ReservedCapacityOptions` in your EC2 Fleet configuration, you do not need to set a `MarketType` in the launch template – EC2 Fleet sets this automatically for each Capacity Reservation type.

```
aws ec2 create-launch-template \
    --launch-template-name my-cr-resource-group-template \
    --launch-template-data \
        '{"ImageId": "ami-0123456789example",
          "CapacityReservationSpecification":
            {"CapacityReservationTarget":
                {"CapacityReservationResourceGroupArn": "arn:aws-eusc:resource-
groups:us-east-1:123456789012:group/my-cr-resource-group"}
            }
        }'
```

Step 4: Create an EC2 Fleet

Create an EC2 Fleet that targets multiple Capacity Reservation types in your Capacity Reservation Resource Group. The key configuration is `ReservedCapacityOptions`, which specifies the following:

- `ReservationTypes` – An ordered list of Capacity Reservation types to target. EC2 Fleet works through the types in this order. Valid values are `on-demand-capacity-reservation`, `capacity-block`, and `interruptible-capacity-reservation`.
- `AllocationStrategy` – How instance types are prioritized within each Capacity Reservation type. Set to `prioritized` to follow your instance type override order.
- `ReservedCapacityFallbackOptions` – Set `MarketTypes` to `["on-demand"]` to launch On-Demand Instances when reserved capacity is insufficient. If you don't specify fallback options, EC2 Fleet does not fall back to any other market type after the specified Capacity Reservation types are exhausted.

Create a file named `config.json` with the following content. In the following example, replace the resource identifiers with your own resource identifiers.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-cr-resource-group-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "p5.48xlarge",
                    "AvailabilityZone": "us-east-1a",
                    "Priority": 1
                },
                {
                    "InstanceType": "p4d.24xlarge",
                    "AvailabilityZone": "us-east-1b",
                    "Priority": 2
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 100,
        "DefaultTargetCapacityType": "reserved-capacity"
    },
    "ReservedCapacityOptions": {
```

```
        "ReservationTypes": ["on-demand-capacity-reservation", "capacity-block",
 "interruptible-capacity-reservation"],
        "ReservedCapacityFallbackOptions": {
            "MarketTypes": ["on-demand"]
        },
        "AllocationStrategy": "prioritized"
    },
    "Type": "instant"
}
```

Use the create-fleet command to launch the fleet:

```
aws ec2 create-fleet --cli-input-json file://config.json
```

For more information, see Create an EC2 Fleet.

How EC2 Fleet resolves Capacity Reservations

Based on the preceding configuration, EC2 Fleet attempts to launch instances in the following order:

1. **ODCRs** – `p5.48xlarge` reservations first (the highest priority instance type), and then `p4d.24xlarge` reservations. Within each instance type, if multiple ODCRs exist, one is selected at random.
2. **Capacity Blocks** – If no available capacity remains across all ODCRs, EC2 Fleet targets Capacity Blocks. `p5.48xlarge` reservations first, and then `p4d.24xlarge`, selected at random within each instance type.
3. **Interruptible Capacity Reservations** – If no available capacity remains across all Capacity Blocks, EC2 Fleet targets interruptible Capacity Reservations. `p5.48xlarge` reservations first, and then `p4d.24xlarge`, selected at random within each instance type.
4. **On-Demand fallback** – If reserved capacity is insufficient to meet the target of 100 instances, the remaining capacity is launched as On-Demand Instances. EC2 Fleet launches these On-Demand Instances according to the allocation strategy that you specify in `OnDemandOptions`.

Note

EC2 Fleet resolves the Capacity Reservation type first, and then the instance type within each Capacity Reservation type. Each Capacity Reservation type is fully exhausted before EC2 Fleet moves to the next type in the ordered list.

(Optional) Step 5: Verify instance properties

Use the describe-instances command to verify which Capacity Reservation type each instance consumed. Instances launched by the fleet display the following properties.

Property	On-Demand Capacity Reservation value	Capacity Block value	Interruptible Capacity Reservation value	On-Demand value
`instance-lifecycle`	`null`	`capacity-block`	`interruptible-capacity-reservation`	`null`
`capacity-reservation-id`	Capacity Reservation ID consumed	Capacity Reservation ID consumed	Capacity Reservation ID consumed	Not present
`capacity-reservation-specification`	Group ARN	Group ARN	Group ARN	Group ARN

You can filter instances by Capacity Reservation Resource Group using the following command:

```
aws ec2 describe-instances \
    --filters "Name=capacity-reservation-specification.capacity-reservation-
target.capacity-reservation-resource-group-arn,Values=arn:aws-eusc:resource-groups:us-
east-1:123456789012:group/my-cr-resource-group"
```

Clean up

To stop incurring charges, terminate the instances when they are no longer needed. Note that instances launched into Capacity Blocks are automatically terminated when the Capacity Block reservation ends. Instances launched into interruptible Capacity Reservations are automatically terminated if the capacity owner reclaims the capacity.

Example CLI configurations for EC2 Fleet

You can define your EC2 Fleet configuration in a JSON file, and then reference that file with the create-fleet command to create your fleet, as follows:

```
aws ec2 create-fleet --cli-input-json file://file_name.json
```

The following examples illustrate launch configurations for various EC2 Fleet use cases. For more information about the configuration parameters, see create-fleet.

Examples

- Example 1: Launch Spot Instances as the default purchasing option
- Example 2: Launch On-Demand Instances as the default purchasing option
- Example 3: Launch On-Demand Instances as the primary capacity
- Example 4: Launch On-Demand Instances using multiple Capacity Reservations
- Example 5: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations
- Example 6: Launch On-Demand Instances using targeted Capacity Reservations

- Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances
- Example 8: Launch Spot Instances in a capacity-optimized fleet
- Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities
- Example 10: Launch Spot Instances in a price-capacity-optimized fleet
- Example 11: Configure attribute-based instance type selection
- Example 12: Launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group

For more CLI examples for fleets of type `instant`, see Configure an EC2 Fleet of type instant.

Example 1: Launch Spot Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is `spot`, which results in the fleet launching 2 Spot Instances.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example 2: Launch On-Demand Instances as the default purchasing option

The following example specifies the minimum parameters required in an EC2 Fleet: a launch template, target capacity, and default purchasing option. The launch template is identified by

its launch template ID and version number. The target capacity for the fleet is 2 instances, and the default purchasing option is on-demand, which results in the fleet launching 2 On-Demand Instances.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
        "DefaultTargetCapacityType": "on-demand"
    }
}
```

Example 3: Launch On-Demand Instances as the primary capacity

The following example specifies the total target capacity of 2 instances for the fleet, and a target capacity of 1 On-Demand Instance. The default purchasing option is spot. The fleet launches 1 On-Demand Instance as specified, but needs to launch one more instance to fulfill the total target capacity. The purchasing option for the difference is calculated as TotalTargetCapacity – OnDemandTargetCapacity = DefaultTargetCapacityType, which results in the fleet launching 1 Spot Instance.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            }

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 2,
```

```
        "OnDemandTargetCapacity": 1,
        "DefaultTargetCapacityType": "spot"
    }
}
```

Example 4: Launch On-Demand Instances using multiple Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the Capacity Reservations to use when there are more Capacity Reservations than are needed to fulfil the target capacity.

In this example, the fleet configuration is as follows:

- Target capacity: 12 On-Demand Instances
- Total unused Capacity Reservations: 15 (more than the fleet's target capacity of 12 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: `lowest-price` (When there are multiple unused Capacity Reservations in multiple instance pools, the fleet determines the pools in which to launch the On-Demand Instances based on the On-Demand allocation strategy.)

  Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
```

```
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount":5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 12, and the default target capacity type is `on-demand`. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

In this example, the On-Demand Instance price is:

- `m5.large` – $0.096 per hour
- `m4.xlarge` – $0.20 per hour
- `m4.2xlarge` – $0.40 per hour

Note

The fleet type must be of type `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-abc1234567example",
                "Version": "1"
            },
            "Overrides": [
                {
                  "InstanceType": "m5.large",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                },
                {
                  "InstanceType": "m4.xlarge",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                },
                {
                  "InstanceType": "m4.2xlarge",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                }
              ]

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 12,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price",
        "CapacityReservationOptions": {
            "UsageStrategy": "use-capacity-reservations-first"
        }
```

```
    },
    "Type": "instant"
}
```

After you create the `instant` fleet using the preceding configuration, the following 12 instances are launched to meet the target capacity:

- 5 `m5.large` On-Demand Instances in `us-east-1a` – `m5.large` in `us-east-1a` is the lowest price, and there are 5 available unused `m5.large` Capacity Reservations
- 5 `m4.xlarge` On-Demand Instances in us-east-1a – `m4.xlarge` in `us-east-1a` is the next lowest price, and there are 5 available unused `m4.xlarge` Capacity Reservations
- 2 `m4.2xlarge` On-Demand Instances in us-east-1a – `m4.2xlarge` in `us-east-1a` is the third lowest price, and there are 5 available unused `m4.2xlarge` Capacity Reservations of which only 2 are needed to meet the target capacity

After the fleet is launched, you can run describe-capacity-reservations to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the `m5.large` and `m4.xlarge` Capacity Reservations were used, with 3 `m4.2xlarge` Capacity Reservations remaining unused.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 3
}
```

Example 5: Launch On-Demand Instances using Capacity Reservations when the total target capacity exceeds the number of unused Capacity Reservations

You can configure a fleet to use On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-reservations-first`. This example demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 16 On-Demand Instances
- Total unused Capacity Reservations: 15 (less than the fleet's target capacity of 16 On-Demand Instances)
- Number of Capacity Reservation pools: 3 (`m5.large`, `m4.xlarge`, and `m4.2xlarge`)
- Number of Capacity Reservations per pool: 5
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

  Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

Capacity Reservations

The account has the following 15 unused Capacity Reservations in 3 different pools. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
```

```
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount":5,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 16, and the default target capacity type is `on-demand`. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

In this example, the On-Demand Instance price is:

- m5.large – $0.096 per hour
- m4.xlarge – $0.20 per hour
- m4.2xlarge – $0.40 per hour

> **Note**
>
> The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateId": "lt-0e8c754449b27161c",
                "Version": "1"
            },
            "Overrides": [
                {
                  "InstanceType": "m5.large",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                },
                {
                  "InstanceType": "m4.xlarge",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                },
                {
                  "InstanceType": "m4.2xlarge",
                  "AvailabilityZone": "us-east-1a",
                  "WeightedCapacity": 1
                }
              ]

        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 16,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price"
        "CapacityReservationOptions": {
            "UsageStrategy": "use-capacity-reservations-first"
        }
    },
    "Type": "instant",
}
```

After you create the `instant` fleet using the preceding configuration, the following 16 instances are launched to meet the target capacity:

- 6 `m5.large` On-Demand Instances in `us-east-1a` – `m5.large` in `us-east-1a` is the lowest price, and there are 5 available unused `m5.large` Capacity Reservations. The Capacity Reservations are used first to launch 5 On-Demand Instances. After the remaining `m4.xlarge` and `m4.2xlarge` Capacity Reservations are used, to meet the target capacity an additional On-Demand Instance is launched according to the On-Demand allocation strategy, which is `lowest-price` in this example.
- 5 `m4.xlarge` On-Demand Instances in `us-east-1a` – `m4.xlarge` in `us-east-1a` is the next lowest price, and there are 5 available unused `m4.xlarge` Capacity Reservations
- 5 `m4.2xlarge` On-Demand Instances in `us-east-1a` – `m4.2xlarge` in `us-east-1a` is the third lowest price, and there are 5 available unused `m4.2xlarge` Capacity Reservations

After the fleet is launched, you can run describe-capacity-reservations to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "m5.large",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-222",
    "InstanceType": "m4.xlarge",
    "AvailableInstanceCount": 0
}

{
    "CapacityReservationId": "cr-333",
    "InstanceType": "m4.2xlarge",
    "AvailableInstanceCount": 0
}
```

Example 6: Launch On-Demand Instances using targeted Capacity Reservations

You can configure a fleet to use `targeted` On-Demand Capacity Reservations first when launching On-Demand Instances by setting the usage strategy for Capacity Reservations to `use-capacity-`

`reservations-first`. This example demonstrates how to launch On-Demand Instances into `targeted` Capacity Reservations, where the attributes of the Capacity Reservations are the same except for their Availability Zones (`us-east-1a` and `us-east-1b`). It also demonstrates how the fleet selects the instance pools in which to launch On-Demand Instances when the total target capacity exceeds the number of available unused Capacity Reservations.

In this example, the fleet configuration is as follows:

- Target capacity: 10 On-Demand Instances
- Total unused `targeted` Capacity Reservations: 6 (less than the fleet's On-Demand target capacity of 10 On-Demand Instances)
- Number of Capacity Reservation pools: 2 (`us-east-1a` and `us-east-1b`)
- Number of Capacity Reservations per pool: 3
- On-Demand allocation strategy: `lowest-price` (When the number of unused Capacity Reservations is less than the On-Demand target capacity, the fleet determines the pools in which to launch the remaining On-Demand capacity based on the On-Demand allocation strategy.)

  Note that you can also use the `prioritized` allocation strategy instead of the `lowest-price` allocation strategy.

For a walkthrough of the procedures that you must perform to accomplish this example, see Tutorial: Configure EC2 Fleet to launch On-Demand Instances using targeted Capacity Reservations.

Capacity Reservations

The account has the following 6 unused Capacity Reservations in 2 different pools. In this example, the pools differ by their Availability Zones. The number of Capacity Reservations in each pool is indicated by `AvailableInstanceCount`.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1a",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

```
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.xlarge",
    "InstancePlatform": "Linux/UNIX",
    "AvailabilityZone": "us-east-1b",
    "AvailableInstanceCount": 3,
    "InstanceMatchCriteria": "open",
    "State": "active"
}
```

Fleet configuration

The following fleet configuration shows only the pertinent configurations for this example. The total target capacity is 10, and the default target capacity type is `on-demand`. The On-Demand allocation strategy is `lowest-price`. The usage strategy for Capacity Reservations is `use-capacity-reservations-first`.

In this example, the On-Demand Instance price for `c5.xlarge` in `us-east-1` is $0.17 per hour.

> **Note**
>
> The fleet type must be `instant`. Other fleet types do not support `use-capacity-reservations-first`.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
               {
                   "InstanceType": "c5.xlarge",
                   "AvailabilityZone": "us-east-1a"
               },
               {
                    "InstanceType": "c5.xlarge",
                    "AvailabilityZone": "us-east-1b"
               }
```

```
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 10,
        "DefaultTargetCapacityType": "on-demand"
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price",
        "CapacityReservationOptions": {
             "UsageStrategy": "use-capacity-reservations-first"
         }
    },
    "Type": "instant"
}
```

After you create the `instant` fleet using the preceding configuration, the following 10 instances are launched to meet the target capacity:

- The Capacity Reservations are used first to launch 6 On-Demand Instances as follows:
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` `targeted` Capacity Reservations in `us-east-1a`
  - 3 On-Demand Instances are launched into the 3 `c5.xlarge` `targeted` Capacity Reservations in `us-east-1b`
- To meet the target capacity, 4 additional On-Demand Instances are launched into regular On-Demand capacity according to the On-Demand allocation strategy, which is `lowest-price` in this example. However, because the pools are the same price (because price is per Region and not per Availability Zone), the fleet launches the remaining 4 On-Demand Instances into either of the pools.

After the fleet is launched, you can run describe-capacity-reservations to see how many unused Capacity Reservations are remaining. In this example, you should see the following response, which shows that all of the Capacity Reservations in all of the pools were used.

```
{
    "CapacityReservationId": "cr-111",
    "InstanceType": "c5.xlarge",
    "AvailableInstanceCount": 0
}
```

```
{
    "CapacityReservationId": "cr-222",
    "InstanceType": "c5.xlarge",
    "AvailableInstanceCount": 0
}
```

Example 7: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the EC2 Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from when the new replacement Spot Instances are launched to when the old Spot Instances are automatically deleted, for `termination-delay`, specify a value in seconds. For more information, see Configuration options.

> **Note**
>
> We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete so that the old instances are only terminated after these procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the EC2 Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacity-optimized`. For more information about what you should consider when configuring an EC2 Fleet for Capacity Rebalancing, see Use Capacity Rebalancing in EC2 Fleet and Spot Fleet to replace at-risk Spot Instances.

```
{
    "ExcessCapacityTerminationPolicy": "termination",
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "LaunchTemplate",
                "Version": "1"
```

```
            },
                 "Overrides": [
                       {
                           "InstanceType": "c3.large",
                           "WeightedCapacity": 1,
                            "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       },
                       {
                           "InstanceType": "c4.large",
                           "WeightedCapacity": 1,
                            "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       },
                       {
                           "InstanceType": "c5.large",
                           "WeightedCapacity": 1,
                            "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       }
                   ]
          }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 5,
        "DefaultTargetCapacityType": "spot"
    },
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        "MaintenanceStrategies": {
            "CapacityRebalance": {
                "ReplacementStrategy": "launch-before-terminate",
                "TerminationDelay": "720"
            }
        }
    }
}
```

Example 8: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set `AllocationStrategy` to `capacity-optimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized",
        },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
                 "Overrides": [
                       {
                           "InstanceType": "r4.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2a"
                           },
                      },
                       {
                           "InstanceType": "m4.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2b"
                           },
                       },
                       {
                           "InstanceType": "c5.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2b"
                           }
                       }
                  ]
           }
    ],
    "TargetCapacitySpecification": {
```

```
            "TotalTargetCapacity": 50,
            "DefaultTargetCapacityType": "spot"

    }
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacity-optimized-prioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacity-optimized-prioritized`. EC2 Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect EC2 Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{
    "SpotOptions": {
        "AllocationStrategy": "capacity-optimized-prioritized"
        },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
                 "Overrides": [
                        {
```

```
                        "InstanceType": "r4.2xlarge",
                        "Priority": 1,
                        "Placement": {
                            "AvailabilityZone": "us-west-2a"
                        },
                    },
                     {
                        "InstanceType": "m4.2xlarge",
                        "Priority": 2,
                        "Placement": {
                            "AvailabilityZone": "us-west-2b"
                        },
                     },
                     {
                        "InstanceType": "c5.2xlarge",
                        "Priority": 3,
                        "Placement": {
                            "AvailabilityZone": "us-west-2b"
                        }
                     }
                ]
            }
    ],
    "TargetCapacitySpecification": {
            "TotalTargetCapacity": 50,
            "DefaultTargetCapacityType": "spot"
}
```

Example 10: Launch Spot Instances in a price-capacity-optimized fleet

The following example demonstrates how to configure an EC2 Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot `AllocationStrategy` to `price-capacity-optimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The EC2 Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{
    "SpotOptions": {
        "AllocationStrategy": "price-capacity-optimized",
```

```
        "MinTargetCapacity": 2,
        "SingleInstanceType": true
    },
    "OnDemandOptions": {
        "AllocationStrategy": "lowest-price"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
                 "Overrides": [
                       {
                           "InstanceType": "r4.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2a"
                           },
                      },
                       {
                           "InstanceType": "m4.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2b"
                           },
                       },
                       {
                           "InstanceType": "c5.2xlarge",
                           "Placement": {
                               "AvailabilityZone": "us-west-2b"
                           }
                       }
                  ]
           }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 50,
        "OnDemandTargetCapacity":0,
        "SpotTargetCapacity":50,
        "DefaultTargetCapacityType": "spot"
    },
    "Type": "instant"
}
```

Example 11: Configure attribute-based instance type selection

The following example demonstrates how to configure an EC2 Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when EC2 Fleet provisions the fleet.

For a list and descriptions of all the possible attributes that you can specify, see InstanceRequirements in the *Amazon EC2 API Reference*.

```
{
 "SpotOptions": {
  "AllocationStrategy": "price-capacity-optimized"
 },
 "LaunchTemplateConfigs": [{
  "LaunchTemplateSpecification": {
   "LaunchTemplateName": "my-launch-template",
   "Version": "1"
  },
  "Overrides": [{
   "InstanceRequirements": {
    "VCpuCount": {
     "Min": 2
    },
    "MemoryMiB": {
     "Min": 4
    }
   }
  }]
 }],
 "TargetCapacitySpecification": {
```

```
  "TotalTargetCapacity": 20,
  "DefaultTargetCapacityType": "spot"
 },
 "Type": "instant"
}
```

Example 12: Launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group

The following example configures an `instant` EC2 Fleet to launch instances across multiple Capacity Reservation types – On-Demand Capacity Reservations, Capacity Blocks for ML, and interruptible Capacity Reservations – using a single Capacity Reservation Resource Group. You specify these preferences in the `ReservedCapacityOptions` structure, and set `DefaultTargetCapacityType` to `reserved-capacity`.

In the following example:

- `ReservationTypes` – An ordered list of the Capacity Reservation types to target. EC2 Fleet works through the types in this order: `on-demand-capacity-reservation`, then `capacity-block`, then `interruptible-capacity-reservation`.
- `AllocationStrategy` – Set to `prioritized` to prioritize instance types within each Capacity Reservation type according to your instance type override order.
- `ReservedCapacityFallbackOptions` – `MarketTypes` is set to `["on-demand"]`, so the fleet launches On-Demand Instances for any target capacity that can't be met from reserved capacity. If you omit this, the fleet does not fall back to any other market type after the specified Capacity Reservation types are exhausted.

The launch template targets the Capacity Reservation Resource Group. When you use `ReservedCapacityOptions`, you don't need to set a `MarketType` in the launch template – EC2 Fleet sets this automatically for each Capacity Reservation type.

```
{
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-cr-resource-group-template",
                "Version": "1"
            },
```

```
            "Overrides": [
                {
                    "InstanceType": "p5.48xlarge",
                    "AvailabilityZone": "us-east-1a",
                    "Priority": 1
                },
                {
                    "InstanceType": "p4d.24xlarge",
                    "AvailabilityZone": "us-east-1b",
                    "Priority": 2
                }
            ]
        }
    ],
    "TargetCapacitySpecification": {
        "TotalTargetCapacity": 100,
        "DefaultTargetCapacityType": "reserved-capacity"
    },
    "ReservedCapacityOptions": {
        "ReservationTypes": ["on-demand-capacity-reservation", "capacity-block",
 "interruptible-capacity-reservation"],
        "ReservedCapacityFallbackOptions": {
            "MarketTypes": ["on-demand"]
        },
        "AllocationStrategy": "prioritized"
    },
    "Type": "instant"
}
```

For a step-by-step tutorial, see Tutorial: Configure your EC2 Fleet to launch instances into multiple Capacity Reservation types using a Capacity Reservation Resource Group.

Example CLI configurations Spot Fleet

You can define your Spot Fleet configuration in a JSON file, and then reference that file using the request-spot-fleet AWS CLI command to create your fleet, as follows:

```
aws ec2 request-spot-fleet --spot-fleet-request-config file://file_name.json
```

The following examples illustrate launch configurations for various Spot Fleet use cases. For more information about the configuration parameters, see request-spot-fleet. For more information about creating a Spot Fleet, see Create a Spot Fleet.

Note

For Spot Fleet, you can't specify a network interface ID in a launch template or launch specification. Make sure you omit the `NetworkInterfaceID` parameter in your launch template or launch specification.

Examples

- Example 1: Launch Spot Instances using the lowest-priced Availability Zone in the Region
- Example 2: Launch Spot Instances using the lowest-priced Availability Zone from a list
- Example 3: Launch Spot Instances using the lowest-priced instance type from a list
- Example 4. Override the price for the request
- Example 5: Launch a Spot Fleet using the diversified allocation strategy
- Example 6: Launch a Spot Fleet using instance weighting
- Example 7: Launch a Spot Fleet using On-Demand capacity
- Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances
- Example 9: Launch Spot Instances in a capacity-optimized fleet
- Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities
- Example 11: Launch Spot Instances in a priceCapacityOptimized fleet
- Example 12: Configure attribute-based instance type selection

Example 1: Launch Spot Instances using the lowest-priced Availability Zone in the Region

The following example specifies a single launch specification without an Availability Zone or subnet. The Spot Fleet launches the instances in the lowest-priced Availability Zone that has a default subnet. The price you pay does not exceed the On-Demand price.

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
```

```
            "KeyName": "my-key-pair",
            "SecurityGroups": [
                {
                    "GroupId": "sg-1a2b3c4d"
                }
            ],
            "InstanceType": "m3.medium",
            "IamInstanceProfile": {
                "Arn": "arn:aws-eusc:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Example 2: Launch Spot Instances using the lowest-priced Availability Zone from a list

The following examples specify two launch specifications with different Availability Zones or subnets, but the same instance type and AMI.

Availability Zones

The Spot Fleet launches the instances in the default subnet of the lowest-priced Availability Zone that you specified.

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "m3.medium",
          "Placement": {
              "AvailabilityZone": "us-west-2a, us-west-2b"
          },
```

```
            "IamInstanceProfile": {
                "Arn": "arn:aws-eusc:iam::123456789012:instance-profile/my-iam-role"
            }
        }
    ]
}
```

Subnets

You can specify default subnets or nondefault subnets, and the nondefault subnets can be from a default VPC or a nondefault VPC. The Spot service launches the instances in whichever subnet is in the lowest-priced Availability Zone.

You can't specify different subnets from the same Availability Zone in a Spot Fleet request.

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "m3.medium",
          "SubnetId": "subnet-a61dafcf, subnet-65ea5f08",
          "IamInstanceProfile": {
              "Arn": "arn:aws-eusc:iam::123456789012:instance-profile/my-iam-role"
          }
      }
  ]
}
```

If the instances are launched in a default VPC, they receive a public IPv4 address by default. If the instances are launched in a nondefault VPC, they do not receive a public IPv4 address by default. Use a network interface in the launch specification to assign a public IPv4 address to instances launched in a nondefault VPC. When you specify a network interface, you must include the subnet ID and security group ID using the network interface.

```
  ...
      {
          "ImageId": "ami-1a2b3c4d",
          "KeyName": "my-key-pair",
          "InstanceType": "m3.medium",
          "NetworkInterfaces": [
              {
                  "DeviceIndex": 0,
                  "SubnetId": "subnet-1a2b3c4d",
                  "Groups": [ "sg-1a2b3c4d" ],
                  "AssociatePublicIpAddress": true
              }
          ],
          "IamInstanceProfile": {
              "Arn": "arn:aws-eusc:iam::123456789012:instance-profile/my-iam-role"
          }
      }
  ...
```

Example 3: Launch Spot Instances using the lowest-priced instance type from a list

The following examples specify two launch configurations with different instance types, but the same AMI and Availability Zone or subnet. The Spot Fleet launches the instances using the specified instance type with the lowest price.

Availability Zone

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "c5.4xlarge",
          "Placement": {
```

```
            "AvailabilityZone": "us-west-2b"
        }
    },
    {
        "ImageId": "ami-1a2b3c4d",
        "SecurityGroups": [
            {
                "GroupId": "sg-1a2b3c4d"
            }
        ],
        "InstanceType": "r3.8xlarge",
        "Placement": {
            "AvailabilityZone": "us-west-2b"
        }
    }
  ]
}
```

Subnet

```
{
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "c5.4xlarge",
          "SubnetId": "subnet-1a2b3c4d"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "SecurityGroups": [
              {
                  "GroupId": "sg-1a2b3c4d"
              }
          ],
          "InstanceType": "r3.8xlarge",
```

```
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

Example 4. Override the price for the request

We recommended that you use the default maximum price, which is the On-Demand price. If you prefer, you can specify a maximum price for the fleet request and maximum prices for individual launch specifications.

The following examples specify a maximum price for the fleet request and maximum prices for two of the three launch specifications. The maximum price for the fleet request is used for any launch specification that does not specify a maximum price. The Spot Fleet launches the instances using the instance type with the lowest price.

Availability Zone

```
{
  "SpotPrice": "1.00",
  "TargetCapacity": 30,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c3.2xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2b"
          },
          "SpotPrice": "0.10"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c3.4xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2b"
          },
          "SpotPrice": "0.20"
      },
      {
          "ImageId": "ami-1a2b3c4d",
```

```
            "InstanceType": "c3.8xlarge",
            "Placement": {
                "AvailabilityZone": "us-west-2b"
            }
        }
    ]
}
```

Subnet

```
{
  "SpotPrice": "1.00",
  "TargetCapacity": 30,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c3.2xlarge",
          "SubnetId": "subnet-1a2b3c4d",
          "SpotPrice": "0.10"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c3.4xlarge",
          "SubnetId": "subnet-1a2b3c4d",
          "SpotPrice": "0.20"
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c3.8xlarge",
          "SubnetId": "subnet-1a2b3c4d"
      }
  ]
}
```

Example 5: Launch a Spot Fleet using the diversified allocation strategy

The following example uses the `diversified` allocation strategy. The launch specifications have different instance types but the same AMI and Availability Zone or subnet. The Spot Fleet distributes the 30 instances across the three launch specifications, such that there are 10 instances

of each type. For more information, see Use allocation strategies to determine how EC2 Fleet or Spot Fleet fulfills Spot and On-Demand capacity.

Availability Zone

```
{
  "SpotPrice": "0.70",
  "TargetCapacity": 30,
  "AllocationStrategy": "diversified",
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c4.2xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2b"
          }
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "m3.2xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2b"
          }
      },
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "r3.2xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2b"
          }
      }
  ]
}
```

Subnet

```
{
    "SpotPrice": "0.70",
    "TargetCapacity": 30,
    "AllocationStrategy": "diversified",
```

```
    "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
    "LaunchSpecifications": [
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "c4.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        },
        {
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "r3.2xlarge",
            "SubnetId": "subnet-1a2b3c4d"
        }
    ]
}
```

A best practice to increase the chance that a spot request can be fulfilled by EC2 capacity in the event of an outage in one of the Availability Zones is to diversify across zones. For this scenario, include each Availability Zone available to you in the launch specification. And, instead of using the same subnet each time, use three unique subnets (each mapping to a different zone).

Availability Zone

```
{
  "SpotPrice": "0.70",
  "TargetCapacity": 30,
  "AllocationStrategy": "diversified",
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {
          "ImageId": "ami-1a2b3c4d",
          "InstanceType": "c4.2xlarge",
          "Placement": {
              "AvailabilityZone": "us-west-2a"
          }
      },
      {
```

```
            "ImageId": "ami-1a2b3c4d",
            "InstanceType": "m3.2xlarge",
            "Placement": {

        }
    ]
}
```

Example 6: Launch a Spot Fleet using instance weighting

The following examples use instance weighting, which means that the price is per unit hour instead of per instance hour. Each launch configuration lists a different instance type and a different weight. The Spot Fleet selects the instance type with the lowest price per unit hour. The Spot Fleet calculates the number of Spot Instances to launch by dividing the target capacity by the instance weight. If the result isn't an integer, the Spot Fleet rounds it up to the next integer, so that the size of your fleet is not below its target capacity.

If the `r3.2xlarge` request is successful, Spot provisions 4 of these instances. Divide 20 by 6 for a total of 3.33 instances, then round up to 4 instances.

If the `c3.xlarge` request is successful, Spot provisions 7 of these instances. Divide 20 by 3 for a total of 6.66 instances, then round up to 7 instances.

For more information, see Use instance weighting to manage cost and performance of your EC2 Fleet or Spot Fleet.

Availability Zone

```
{
  "SpotPrice": "0.70",
  "TargetCapacity": 20,
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "LaunchSpecifications": [
      {

          "InstanceType": "c3.xlarge",
          "SubnetId": "subnet-1a2b3c4d",
          "WeightedCapacity": 3
      }
  ]
}
```

Example 7: Launch a Spot Fleet using On-Demand capacity

To ensure that you always have instance capacity, you can include a request for On-Demand capacity in your Spot Fleet request. If there is capacity, the On-Demand request is always fulfilled. The balance of the target capacity is fulfilled as Spot if there is capacity and availability.

The following example specifies the desired target capacity as 10, of which 5 must be On-Demand capacity. Spot capacity is not specified; it is implied in the balance of the target capacity minus the On-Demand capacity. Amazon EC2 launches 5 capacity units as On-Demand, and 5 capacity units (10-5=5) as Spot if there is available Amazon EC2 capacity and availability.

```
{
  "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-tagging-
role",
  "AllocationStrategy": "lowestPrice",
  "TargetCapacity": 10,
```

```
  "SpotPrice": null,
  "ValidFrom": "2018-04-04T15:58:13Z",

        "Version": "2"
      },
      "Overrides": [
        {
          "InstanceType": "t2.medium",
          "WeightedCapacity": 1,
          "SubnetId": "subnet-d0dc51fb"
        }
      ]
    }
  ]
}
```

Example 8: Configure Capacity Rebalancing to launch replacement Spot Instances

The following example configures the Spot Fleet to launch a replacement Spot Instance when Amazon EC2 emits a rebalance recommendation for a Spot Instance in the fleet. To configure the automatic replacement of Spot Instances, for `ReplacementStrategy`, specify `launch-before-terminate`. To configure the time delay from the launch of the new replacement Spot Instances to the automatic deletion of the old Spot Instances, for `termination-delay`, specify a value in seconds. For more information, see Configuration options.

Note

We recommend using `launch-before-terminate` only if you can predict how long your instance shutdown procedures will take to complete. This ensures that the old instances are terminated only after the shutdown procedures are completed. You are charged for all instances while they are running.

The effectiveness of the Capacity Rebalancing strategy depends on the number of Spot capacity pools specified in the Spot Fleet request. We recommend that you configure the fleet with a diversified set of instance types and Availability Zones, and for `AllocationStrategy`, specify `capacityOptimized`. For more information about what you should consider when configuring a Spot Fleet for Capacity Rebalancing, see Use Capacity Rebalancing in EC2 Fleet and Spot Fleet to replace at-risk Spot Instances.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimized",
        "IamFleetRole": "arn:aws-eusc:iam::123456789012:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
                    "LaunchTemplateName": "LaunchTemplate",
                    "Version": "1"
                },
                 "Overrides": [
                       {
                           "InstanceType": "c3.large",
                           "WeightedCapacity": 1,
                           "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       },
                       {
                           "InstanceType": "c4.large",
                           "WeightedCapacity": 1,
                           "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       },
                       {
                           "InstanceType": "c5.large",
                           "WeightedCapacity": 1,
                           "Placement": {
                               "AvailabilityZone": "us-east-1a"
                           }
                       }
                ]
          }
    ],
```

```
        "TargetCapacity": 5,
        "SpotMaintenanceStrategies": {
            "CapacityRebalance": {
                "ReplacementStrategy": "launch-before-terminate",
                "TerminationDelay": "720"
            }
        }
    }
}
```

Example 9: Launch Spot Instances in a capacity-optimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity. To optimize for capacity, you must set `AllocationStrategy` to `capacityOptimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching.

```
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimized",
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                    "AvailabilityZone": "us-west-2a"
                },
                {
                    "InstanceType": "m4.2xlarge",
                    "AvailabilityZone": "us-west-2b"
                },
                {
                    "InstanceType": "c5.2xlarge",
```

```
                    "AvailabilityZone": "us-west-2b"
                }
            ]
        }
    ]
}
```

Example 10: Launch Spot Instances in a capacity-optimized fleet with priorities

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for capacity while using priority on a best-effort basis.

When using the `capacityOptimizedPrioritized` allocation strategy, you can use the `Priority` parameter to specify the priorities of the Spot capacity pools, where the lower the number the higher priority. You can also set the same priority for several Spot capacity pools if you favor them equally. If you do not set a priority for a pool, the pool will be considered last in terms of priority.

To prioritize Spot capacity pools, you must set `AllocationStrategy` to `capacityOptimizedPrioritized`. Spot Fleet will optimize for capacity first, but will honor the priorities on a best-effort basis (for example, if honoring the priorities will not significantly affect Spot Fleet's ability to provision optimal capacity). This is a good option for workloads where the possibility of disruption must be minimized and the preference for certain instance types matters.

In the following example, the three launch specifications specify three Spot capacity pools. Each pool is prioritized, where the lower the number the higher priority. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with the highest priority on a best-effort basis, but optimizes for capacity first.

```
{
    "TargetCapacity": "50",
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "capacityOptimizedPrioritized"
    },
    "LaunchTemplateConfigs": [
        {
            "LaunchTemplateSpecification": {
                "LaunchTemplateName": "my-launch-template",
                "Version": "1"
            },
```

```
            "Overrides": [
                {
                    "InstanceType": "r4.2xlarge",
                   "Priority": 1,
                    "AvailabilityZone": "us-west-2a"
                },
                {
                          "InstanceType": "m4.2xlarge",
                          "Priority": 2,
                          "AvailabilityZone": "us-west-2b"
                },
                {
                          "InstanceType": "c5.2xlarge",
                          "Priority": 3,
                          "AvailabilityZone": "us-west-2b"
                }
            ]
        }
    ]
}
```

Example 11: Launch Spot Instances in a priceCapacityOptimized fleet

The following example demonstrates how to configure a Spot Fleet with a Spot allocation strategy that optimizes for both capacity and lowest price. To optimize for capacity while taking price into consideration, you must set the Spot `AllocationStrategy` to `priceCapacityOptimized`.

In the following example, the three launch specifications specify three Spot capacity pools. The target capacity is 50 Spot Instances. The Spot Fleet attempts to launch 50 Spot Instances into the Spot capacity pool with optimal capacity for the number of instances that are launching while also choosing the pool that is the lowest priced.

```
{
    "SpotFleetRequestConfig": {
        "AllocationStrategy": "priceCapacityOptimized",
        "OnDemandAllocationStrategy": "lowestPrice",
        "ExcessCapacityTerminationPolicy": "default",
        "IamFleetRole": "arn:aws-eusc:iam::111111111111:role/aws-ec2-spot-fleet-
tagging-role",
        "LaunchTemplateConfigs": [
            {
                "LaunchTemplateSpecification": {
```

```
                    "LaunchTemplateId": "lt-0123456789example",
                    "Version": "1"
                },
                "Overrides": [
                     {
                          "InstanceType": "r4.2xlarge",
                          "AvailabilityZone": "us-west-2a"
                     },
                     {
                          "InstanceType": "m4.2xlarge",
                          "AvailabilityZone": "us-west-2b"
                     },
                     {
                          "InstanceType": "c5.2xlarge",
                          "AvailabilityZone": "us-west-2b"
                     }
                ]
            }
        ],
        "TargetCapacity": 50,
        "Type": "request"
    }
}
```

Example 12: Configure attribute-based instance type selection

The following example demonstrates how to configure a Spot Fleet to use attribute-based instance type selection for identifying instance types. To specify the required instance attributes, you specify the attributes in the `InstanceRequirements` structure.

In the following example, two instance attributes are specified:

- `VCpuCount` – A minimum of 2 vCPUs is specified. Because no maximum is specified, there is no maximum limit.
- `MemoryMiB` – A minimum of 4 MiB of memory is specified. Because no maximum is specified, there is no maximum limit.

Any instance types that have 2 or more vCPUs and 4 MiB or more of memory will be identified. However, price protection and the allocation strategy might exclude some instance types when Spot Fleet provisions the fleet.

For a list and descriptions of all the possible attributes that you can specify, see InstanceRequirements in the *Amazon EC2 API Reference*.

```
{
 "AllocationStrategy": "priceCapacityOptimized",
 "TargetCapacity": 20,
 "Type": "request",
 "LaunchTemplateConfigs": [{
  "LaunchTemplateSpecification": {
   "LaunchTemplateName": "my-launch-template",
   "Version": "1"
  },
  "Overrides": [{
   "InstanceRequirements": {
    "VCpuCount": {
     "Min": 2
    },
    "MemoryMiB": {
     "Min": 4
    }
   }
  }]
 }]
}
```

Quotas for EC2 Fleet and Spot Fleet

Your AWS account has default quotas, formerly referred to as limits, for each AWS service. Unless otherwise noted, each quota is Region-specific.

The usual Amazon EC2 quotas apply to instances launched by an EC2 Fleet or a Spot Fleet, such as Spot Instance limits and volume limits.

In addition, your AWS account has the following quotas related to EC2 Fleet and Spot Fleet:

Quota description	Quota
The number of EC2 Fleets and Spot Fleets per Region of type `maintain` and `request`	1,000 [1] [2] [3]

Quota description	Quota
in the `active`, `deleted_running` , and `cancelled_running` states	
The number of EC2 Fleets of type `instant`	Unlimited
The number of Spot capacity pools (unique combination of instance type and subnet) for EC2 Fleets and Spot Fleets of type `maintain` and `request`	300 [1]
The number of Spot capacity pools (unique combination of instance type and subnet) for EC2 Fleets of type `instant`	Unlimited
The size of the user data in a launch specification	16 KB [2]
The target capacity per EC2 Fleet or Spot Fleet	10,000
The number of Capacity Reservations per EC2 Fleet request when using `ReservedCapacityOptions`	5,000 [2]
The target capacity across all EC2 Fleets and Spot Fleets in a Region	100,000 [1]
An EC2 Fleet request or a Spot Fleet request can't span Regions.	
An EC2 Fleet request or a Spot Fleet request can't span different subnets from the same Availability Zone.	

[1] These quotas apply to both your EC2 Fleets and your Spot Fleets.

[2] These are hard quotas. You can't request an increase for these quotas.

[3] After you delete an EC2 Fleet or cancel a Spot Fleet request, and if you specified that the fleet should *not* terminate its Spot Instances when you deleted or canceled the request, the fleet request enters the `deleted_running` (EC2 Fleet) or `cancelled_running` (Spot Fleet) state and the instances continue to run until they are interrupted or you terminate them manually. If you terminate the instances, the fleet request enters the `deleted_terminating` (EC2 Fleet) or `cancelled_terminating` (Spot Fleet) state and does not count towards this quota. For more information, see Delete an EC2 Fleet request and the instances in the fleet and Cancel (delete) a Spot Fleet request.

Request a quota increase for target capacity

If you need more than the default quota for target capacity, you can request a quota increase.

To request a quota increase for target capacity

1. Open the Support Center Create case form.
2. Choose **Service limit increase**.
3. For **Limit type**, choose **EC2 Fleet**.
4. For **Region**, choose the AWS Region in which to request the quota increase.
5. For **Limit**, choose **Target Fleet Capacity per Fleet (in units)** or **Target Fleet Capacity per Region (in units)**, depending on which quota you want to increase.
6. For **New limit value**, enter the new quota value.
7. To request an increase for another quota, choose **Add another request**, and repeat Steps 4–6.
8. For **Use case description**, enter your reason for requesting a quota increase.
9. Under **Contact options**, specify your preferred contact language and contact method.
10. Choose **Submit**.

Networking in Amazon EC2

Amazon VPC enables you to launch AWS resources, such as Amazon EC2 instances, into a virtual network dedicated to your AWS account, known as a virtual private cloud (VPC). When you launch an instance, you can select a subnet from the VPC. The instance is configured with a primary network interface, which is a logical virtual network card. The instance receives a primary private IP address from the IPv4 address of the subnet, and it is assigned to the primary network interface.

You can control whether the instance receives a public IP address from Amazon's pool of public IP addresses. The public IP address of an instance is associated with your instance only until it is stopped or terminated. If you require a persistent public IP address, you can allocate an Elastic IP address for your AWS account and associate it with an instance or a network interface. An Elastic IP address remains associated with your AWS account until you release it, and you can move it from one instance to another as needed. You can bring your own IP address range to your AWS account, where it appears as an address pool, and then allocate Elastic IP addresses from your address pool.

To increase network performance and reduce latency, you can launch instances in a placement group. You can get significantly higher packet per second (PPS) performance using enhanced networking. You can accelerate high performance computing and machine learning applications using an Elastic Fabric Adapter (EFA), which is a network device that you can attach to a supported instance type.

Features

- Regions and Zones
- Amazon EC2 instance IP addressing
- EC2 instance hostnames and domains
- Bring your own IP addresses (BYOIP) to Amazon EC2
- Elastic IP addresses
- Elastic network interfaces
- Amazon EC2 instance network bandwidth
- Enhanced networking on Amazon EC2 instances
- Elastic Fabric Adapter for AI/ML and HPC workloads on Amazon EC2
- Amazon EC2 topology
- Placement groups for your Amazon EC2 instances
- Network maximum transmission unit (MTU) for your EC2 instance

- Virtual private clouds for your EC2 instances
- Secondary Networks

Regions and Zones

Amazon EC2 is hosted in multiple locations world-wide. These locations are composed of AWS Regions, Availability Zones, Local Zones, AWS Outposts, and Wavelength Zones.

- **Regions** are separate geographic areas.
- **Availability Zones** are multiple, isolated locations within each Region.
- **Local Zones** provide you with the ability to place resources, such as compute and storage, in multiple locations closer to your end users.
- **Wavelength Zones** provide you with the ability to build applications that deliver ultra-low latencies to 5G devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks.
- **AWS Outposts** brings native AWS services, infrastructure, and operating models to virtually any data center, colocation space, or on-premises facility.

AWS operates state-of-the-art, highly available data centers. Although rare, failures can occur that affect the availability of instances that are in the same location. If you host all of your instances in a single location that is affected by a failure, none of your instances would be available.

For more information, see AWS Global Infrastructure.

Contents

- Regions
- Availability Zones
- Local Zones
- Wavelength Zones
- AWS Outposts

Regions

Each Region is designed to be isolated from the other Regions. This achieves the greatest possible fault tolerance and stability.

When you launch an instance, select a Region that puts your instances close to specific customers, or that meets the legal or other requirements that you have. You can launch instances in multiple Regions.

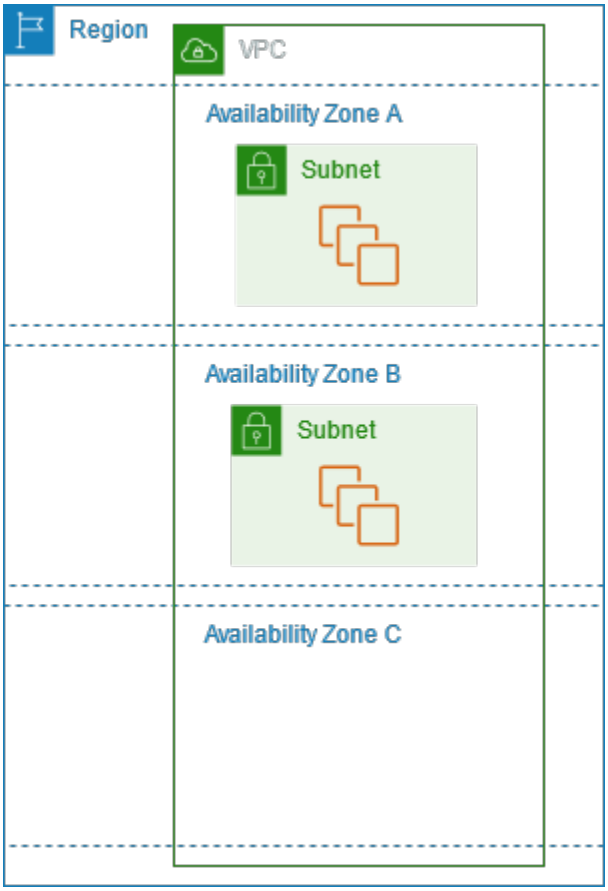
When you view your resources, you see only the resources that are tied to the Region that you specified. This is because Regions are isolated from each other, and we don't automatically replicate resources across Regions.

Available Regions

For the list of available Regions, see AWS Regions.

Regional endpoints for Amazon EC2

When you work with an instance using the command line interface or API actions, you must specify its Regional endpoint. For more information about the Regions and endpoints for Amazon EC2, see Amazon EC2 service endpoints in the *Amazon EC2 Developer Guide*.



For more information, see AWS Regions in the *AWS Regions and Availability Zones User Guide*.

Availability Zones

Each Region has multiple, isolated locations known as *Availability Zones*. The code for an Availability Zone is its Region code followed by a letter identifier. For example, `eusc-de-east-1a`.

By launching EC2 instances in multiple Availability Zones, you can protect your applications from the failure of a single location in the Region.

The following diagram illustrates multiple Availability Zones in an AWS Region. Availability Zone A and Availability Zone B each have one subnet, and each subnet has EC2 instances. Availability Zone C has no subnets, therefore you can't launch instances into this Availability Zone.

For more information, see Virtual private clouds for your EC2 instances.

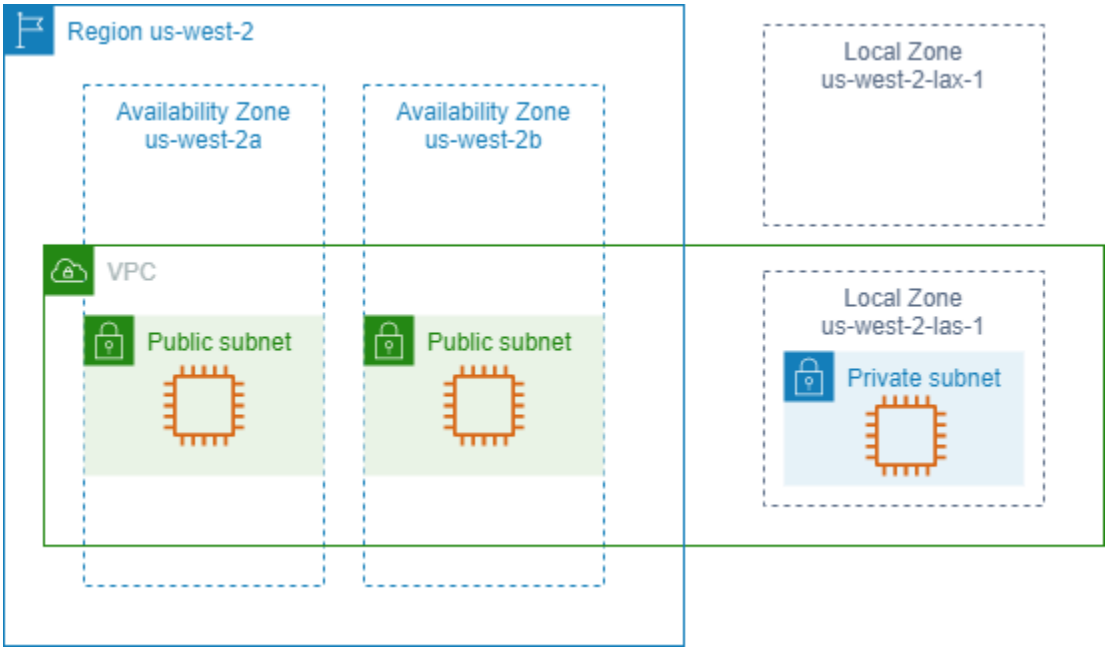
Availability Zones by Region

For the list of Availability Zones by Region, see AWS Availability Zones.

Instances in Availability Zones

When you launch an instance, you select a Region and a virtual private cloud (VPC). Then, you can either select a subnet from one of the Availability Zones or let us choose a subnet for you. When you launch your initial instances, we recommend that you let us select an Availability Zone for you based on system health and available capacity. If you launch additional instances, specify an Availability Zone only if your new instances must be close to, or separated from, your existing instances.

If you distribute instances across multiple Availability Zones and an instance fails, you can design your application so that an instance in another Availability Zone handles requests instead.



For more information, see AWS Availability Zones in the *AWS Regions and Availability Zones User Guide*.

Local Zones

A Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support Direct Connect, so that resources created in a Local Zone can serve local users with low-latency communications. For more information, see What is AWS Local Zones? in the *AWS Local Zones User Guide*.

The code for a Local Zone is its Region code followed by an identifier that indicates its physical location. For example, `us-west-2-lax-1` in Los Angeles.

The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and two of its Local Zones. The VPC spans the Availability Zones and one of the Local Zones. Each zone in the VPC has one subnet, and each subnet has an instance.

Available Local Zones

For the list of available Local Zones, see Available Local Zones in the *AWS Local Zones User Guide*. For the list of announced Local Zones, see AWS Local Zones locations.

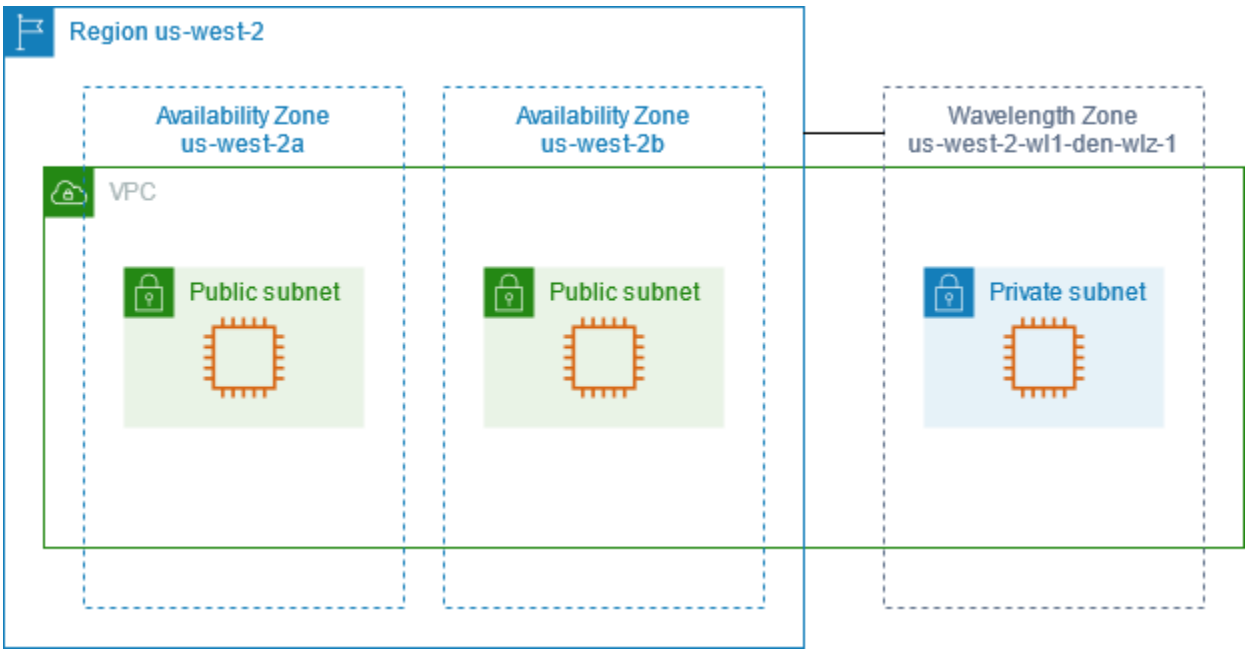
Instances in Local Zones

To use a Local Zone, you must first enable it. Then, create a subnet in the Local Zone. You can specify the Local Zone subnet when you launch instances, which places it in the Local Zone subnet in the Local Zone.

When you launch an instance in a Local Zone, you also allocate an IP address from a network border group. A network border group is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-west-2-lax-1a`. You can allocate the following IP addresses from a network border group:

- Amazon-provided Elastic IPv4 addresses
- Amazon-provided IPv6 VPC addresses (available only in the Los Angeles zones)

For more information about how to launch an instance in a Local Zone, see Getting started with AWS Local Zones in the *AWS Local Zones User Guide*.



Wavelength Zones

AWS Wavelength enables developers to build applications that deliver ultra-low latencies to mobile devices and end users. Wavelength deploys standard AWS compute and storage services to the edge of telecommunication carriers' 5G networks. Developers can extend a virtual private cloud (VPC) to one or more Wavelength Zones, and then use AWS resources like Amazon EC2 instances to run applications that require ultra-low latency and a connection to AWS services in the Region.

A Wavelength Zone is an isolated zone in the carrier location where the Wavelength infrastructure is deployed. Wavelength Zones are tied to a Region. A Wavelength Zone is a logical extension of a Region, and is managed by the control plane in the Region.

The code for a Wavelength Zone is its Region code followed by an identifier that indicates the physical location. For example, `us-east-1-wl1-bos-wlz-1` in Boston.

The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and a Wavelength Zone. The VPC spans the Availability Zones and the Wavelength Zone. Each zone in the VPC has one subnet, and each subnet has an instance.

Wavelength Zones are not available in every Region. For information about the Regions that support Wavelength Zones, see Available Wavelength Zones in the *AWS Wavelength Developer Guide*.

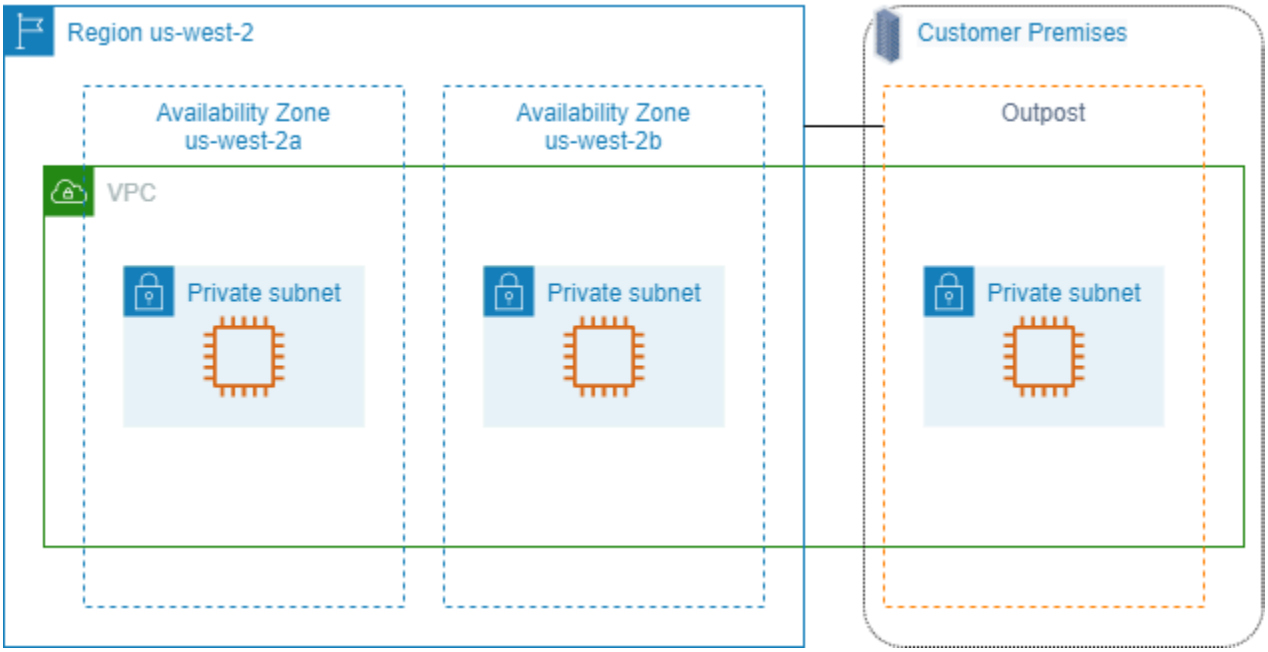
Available Wavelength Zones

For the list of available Wavelength Zones, see Available Wavelength Zones in the *AWS Wavelength Guide*.

Instances in Wavelength Zones

To use a Wavelength Zone, you must first opt in to the Zone. Then, create a subnet in the Wavelength Zone. You can specify the Wavelength subnet when you launch instances. You also allocate a carrier IP address from a network border group, which is a unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-east-1-wl1-bos-wlz-1`.

For step-by-step directions to launch an instance in a Wavelength Zone, see Get started with AWS Wavelength in the *AWS Wavelength Developer Guide*.



AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming

interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region. You can create subnets on your Outpost and specify them when you create AWS resources. Instances in Outpost subnets communicate with other instances in the AWS Region using private IP addresses, all within the same VPC.

The following diagram illustrates the AWS Region `us-west-2`, two of its Availability Zones, and an Outpost. The VPC spans the Availability Zones and the Outpost. The Outpost is in an on-premises customer data center. Each zone in the VPC has one subnet, and each subnet has an instance.

Instances on an Outpost

To begin using AWS Outposts, you must create an Outpost and order Outpost capacity. AWS Outposts offers two form factors, Outposts racks and Outposts servers. For more information about Outposts configurations, see AWS Outposts Family. After your Outpost equipment is installed, the compute and storage capacity is available for you when you launch EC2 instances on your Outpost.

To launch EC2 instances, you must create an Outpost subnet. Security groups control inbound and outbound traffic for instances in an Outpost subnet, just as they do for instances in an Availability Zone subnet. To connect to instances in Outpost subnets using SSH, specify a key pair when you launch them, just as you do for instances in Availability Zone subnets.

For more information, see Get started with Outposts racks or Get started with Outposts servers.

Volumes on an Outposts rack

If your Outposts compute capacity is on an Outpost rack, you can create EBS volumes in the Outpost subnet that you created. When you create the volume, specify the Amazon Resource Name (ARN) of the Outpost.

The following create-volume command creates an empty 50 GB volume on the specified Outpost.

```
aws ec2 create-volume --availability-zone us-east-2a --outpost-arn arn:aws-
eusc:outposts:us-east-2:123456789012:outpost/op-03e6fecad652a6138 --size 50
```

You can dynamically modify the size of your Amazon EBS gp2 volumes without detaching them. For more information about modifying a volume without detaching it, see Request modifications to your EBS volumes in the *Amazon EBS User Guide*.

We recommend that you limit the root volume for an instance on an Outpost rack to 30 GiB or smaller. You can specify data volumes in the block device mapping of the AMI or the instance to provide additional storage. To trim unused blocks from the boot volume, see How to Build Sparse EBS Volumes in the *AWS Partner Network Blog*.

We recommend that you increase the NVMe timeout for the root volume. For more information, see I/O operation timeout in the *Amazon EBS User Guide*.

Volumes on an Outposts server

Instances on Outposts servers provide instance store volumes but do not support EBS volumes. Choose an Amazon EBS-backed AMI with only a single EBS snapshot. Choose an instance size with enough instance storage to meet the needs of your application. For more information, see Instance store volume limits.

Amazon EC2 instance IP addressing

Amazon EC2 and Amazon VPC support both the IPv4 and IPv6 addressing protocols. By default, Amazon VPC uses the IPv4 addressing protocol; you can't disable this behavior. When you create a VPC, you must specify an IPv4 CIDR block (a range of private IPv4 addresses). You can optionally assign an IPv6 CIDR block to your VPC and assign IPv6 addresses from that block to instances in your subnets.

When you launch an EC2 instance, you specify a VPC and a subnet. The instance receives a private IPv4 address from the CIDR range of the subnet. You can optionally configure your instances with public IPv4 addresses and IPv6 addresses. If EC2 instances in different VPCs communicate using public IP addresses, the traffic stays in the AWS private global network and does not traverse the public internet.

Contents

- Private IPv4 addresses
- Public IPv4 addresses
- Public IPv4 address optimization
- IPv6 addresses
- Multiple IP addresses
- EC2 instance hostnames
- Link-local addresses
- Manage the IPv4 addresses for your EC2 instances
- Manage the IPv6 addresses for your EC2 instances
- Secondary IP addresses for your EC2 instances
- Configure secondary private IPv4 addresses for Windows instances

Private IPv4 addresses

A private IPv4 address is an IP address that's not reachable over the Internet. You can use private IPv4 addresses for communication between instances in the same VPC. For more information about the standards and specifications of private IPv4 addresses, see RFC 1918. We allocate private IPv4 addresses to instances using DHCP.

> **Note**
>
> You can create a VPC with a publicly routable CIDR block that falls outside of the private IPv4 address ranges specified in RFC 1918. However, for the purposes of this documentation, we refer to private IPv4 addresses (or 'private IP addresses') as the IP addresses that are within the IPv4 CIDR range of your VPC.

VPC subnets can be one of the following types:

- IPv4-only subnets – You can only create resources in these subnets with IPv4 addresses assigned to them.
- IPv6-only subnets – You can only create resources in these subnets with IPv6 addresses assigned to them.
- IPv4 and IPv6 subnets – You can create resources in these subnets with either IPv4 or IPv6 addresses assigned to them.

When you launch an EC2 instance into an IPv4-only or dual stack (IPv4 and IPv6) subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. For more information, see IP addressing in the *Amazon VPC User Guide*. If you don't specify a primary private IP address when you launch the instance, we select an available IP address in the subnet's IPv4 range for you. Each instance has a default network interface (index 0) that is assigned the primary private IPv4 address. You can also specify additional private IPv4 addresses, known as *secondary private IPv4 addresses*. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another. For more information, see Multiple IP addresses.

A private IPv4 address, regardless of whether it is a primary or secondary address, remains associated with the network interface when the instance is stopped and started, or hibernated and started, and is released when the instance is terminated.

Public IPv4 addresses

A public IP address is an IPv4 address that's reachable from the Internet. You can use public addresses for communication between your instances and the Internet.

When you launch an instance in a default VPC, we assign it a public IP address by default. When you launch an instance into a nondefault VPC, the subnet has an attribute that determines whether instances launched into that subnet receive a public IP address from the public IPv4 address pool. By default, we don't assign a public IP address to instances launched in a nondefault subnet.

You can control whether your instance receives a public IP address as follows:

- **Modify the public IP addressing attribute of your subnet.** For more information, see Modify the public IPv4 addressing attribute for your subnet in the *Amazon VPC User Guide*.
- **Enable or disable the public IP addressing feature during launch.** This overrides the subnet's public IP addressing attribute. For more information, see Assign a public IPv4 address at launch.
- **Unassign a public IP address from your instance after launch.** For more information, see the section called “Manage IP addresses”.

A public IP address is assigned to your instance from Amazon's pool of public IPv4 addresses, and is not associated with your AWS account. When a public IP address is disassociated from your instance, it is released back into the public IPv4 address pool, and you cannot reuse it.

We release the public IP address from your instance and assign a new one in the following cases:

- We release the public IP address when the instance is stopped, hibernated, or terminated. We assign a new public IP address when you start your stopped or hibernated instance.
- We release the public IP address when you associate an Elastic IP address with the instance. We assign a new public IP address when you disassociate the Elastic IP address from your instance.
- If we release the public IP address of your instance and it has a secondary network interface, we do not assign a new public IP address.
- If we release the public IP address of your instance and it has a secondary private IP address that is associated with an Elastic IP address, we do not assign a new public IP address.

If you require a persistent public IP address that can be associated to and from instances as you require, use an Elastic IP address instead.

If you use dynamic DNS to map an existing DNS name to a new instance's public IP address, it might take up to 24 hours for the IP address to propagate through the Internet. As a result, new instances might not receive traffic while terminated instances continue to receive requests. To solve this problem, use an Elastic IP address. You can allocate your own Elastic IP address, and associate it with your instance. For more information, see Elastic IP addresses.

If you are using Amazon VPC IP Address Manager (IPAM), you can get a contiguous block of public IPv4 addresses from AWS and use it to allocate Elastic IP addresses to AWS resources. Using contiguous IPv4 address blocks can significantly reduce management overhead for security access control lists and simplify IP address allocation and tracking for enterprises scaling on AWS. For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.

Considerations

- AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the **Public IPv4 Address** tab on the Amazon VPC pricing page.
- Instances that access other instances through their public NAT IP address are charged for regional or Internet data transfer, depending on whether the instances are in the same Region.

Public IPv4 address optimization

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the **Public IPv4 Address** tab on the Amazon VPC pricing page.

The following list contains actions you can take to optimize the number of public IPv4 addresses you use:

- Use an elastic load balancer to load balance traffic to your EC2 instances and disable **Auto-assign public IP** on the primary ENI assigned to the instances. Load balancers use a single public IPv4 address, so this reduces your public IPv4 address count. You may also want consolidate existing load balancers to further reduce the public IPv4 address count.
- If the only reason for using a NAT gateway is to SSH into an EC2 instance in a private subnet for maintenance or emergencies, consider using EC2 Instance Connect Endpoint instead. With EC2 Instance Connect Endpoint, you can connect to an instance from the internet without requiring the instance to have a public IPv4 address.
- If your EC2 instances are in a public subnet with public IP addresses allocated to them, consider moving the instances to a private subnet, removing the public IP addresses, and using a public NAT gateway to allow access to and from your EC2 instances. There are cost considerations for using NAT gateways. Use this calculation method to decide if NAT gateways are cost effective. You can get the `Number of public IPv4 addresses` required for this calculation by creating an AWS Billing Cost and Usage Report.

  ```
  NAT gateway per hour + NAT gateway public IPs + NAT gateway transfer / Existing
   public IP cost
  ```

  Where:

  - `NAT gateway per hour = $0.045 * 730 hours in a month * Number of Availability Zones the NAT gateways are in`
  - `NAT gateway public IPs = $0.005 * 730 hours in a month * Number of IPs associated with your NAT gateways`
  - `NAT gateway transfer = $0.045 * Number of GBs that will go through the NAT gateway in a month`
  - `Existing public IP cost = $0.005 * 730 hours in a month * Number of public IPv4 addresses`

If the total is less than 1, NAT gateways are cheaper than public IPv4 addresses.

- Use AWS PrivateLink to connect privately to AWS services or services hosted by other AWS accounts rather than using public IPv4 addresses and internet gateways.
- Bring your own IP address range (BYOIP) to AWS and use the range for public IPv4 addresses rather than using Amazon-owned public IPv4 addresses.
- Turn off auto-assign public IPv4 address for instances launched into subnets. This option is generally disabled by default for VPCs when you create a subnet, but you should check your existing subnets to ensure it's disabled.
- If you have EC2 instances that do not need public IPv4 addresses, check that the network interfaces attached to your instances have **Auto-assign public IP** disabled.
- Configure accelerator endpoints in AWS Global Accelerator for EC2 instances in private subnets to enable internet traffic to flow directly to the endpoints in your VPCs without requiring public IP addresses. You can also bring your own addresses to AWS Global Accelerator and use your own IPv4 addresses for your accelerator's static IP addresses.

IPv6 addresses

IPv6 addresses are globally unique and can be configured to remain private or reachable over the Internet. Both public and private IPv6 addressing is available in AWS:

- **Private IPv6**: AWS considers private IPv6 addresses those that are not advertised and cannot be advertised on the Internet from AWS.
- **Public IPv6**: AWS considers public IPv6 addresses those that are advertised on the Internet from AWS.

For more information about public and private IPv6 addresses, see IPv6 addresses in the *Amazon VPC User Guide*.

All instance types support IPv6 addresses except for the following: C1, M1, M2, M3, and T1.

Your EC2 instances receive an IPv6 address if an IPv6 CIDR block is associated with your VPC and subnet, and if one of the following is true:

- Your subnet is configured to automatically assign an IPv6 address to an instance during launch. For more information, see Modify the IP addressing attributes of your subnet.

- You assign an IPv6 address to your instance during launch.
- You assign an IPv6 address to the primary network interface of your instance after launch.
- You assign an IPv6 address to a network interface in the same subnet, and attach the network interface to your instance after launch.

When your instance receives an IPv6 address during launch, the address is associated with the primary network interface (index 0) of the instance. You can manage the IPv6 addresses for your instances primary network interface as follows:

- Assign and unassign IPv6 addresses from the network interface. The number of IPv6 addresses you can assign to a network interface and the number of network interfaces you can attach to an instance varies per instance type. For more information, see Maximum IP addresses per network interface.
- Enable a primary IPv6 address. A primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. For more information, see Create a network interface for your EC2 instance or Manage the IP addresses for your network interface.

An IPv6 address persists when you stop and start, or hibernate and start, your instance, and is released when you terminate your instance. You cannot reassign an IPv6 address while it's assigned to another network interface—you must first unassign it.

You can control whether instances are reachable through their IPv6 addresses by controlling the routing for your subnet or by using security group and network ACL rules. For more information, see Internetwork traffic privacy in the *Amazon VPC User Guide*.

For more information about reserved IPv6 address ranges, see IANA IPv6 Special-Purpose Address Registry and RFC4291.

Multiple IP addresses

You can specify multiple private IPv4 and IPv6 addresses for your instances. The number of network interfaces and private IPv4 and IPv6 addresses that you can specify for an instance depends on the instance type. For more information, see Maximum IP addresses per network interface.

Use cases

- Host multiple websites on a single server by using multiple SSL certificates on a single server and associating each certificate with a specific IP address.
- Operate network appliances, such as firewalls or load balancers, that have multiple IP addresses for each network interface.
- Redirect internal traffic to a standby instance in case your instance fails, by reassigning the secondary IP address to the standby instance.

How multiple IP addresses work

- You can assign a secondary private IPv4 address to any network interface.
- You can assign multiple IPv6 addresses to a network interface that's in a subnet that has an associated IPv6 CIDR block.
- You must choose a secondary IPv4 address from the IPv4 CIDR block range of the subnet for the network interface.
- You must choose IPv6 addresses from the IPv6 CIDR block range of the subnet for the network interface.
- You associate security groups with network interfaces, not individual IP addresses. Therefore, each IP address you specify in a network interface is subject to the security group of its network interface.
- Multiple IP addresses can be assigned and unassigned to network interfaces attached to running or stopped instances.
- Secondary private IPv4 addresses that are assigned to a network interface can be reassigned to another one if you explicitly allow it.
- An IPv6 address cannot be reassigned to another network interface; you must first unassign the IPv6 address from the existing network interface.
- When assigning multiple IP addresses to a network interface using the command line tools or API, the entire operation fails if one of the IP addresses can't be assigned.
- Primary private IPv4 addresses, secondary private IPv4 addresses, Elastic IP addresses, and IPv6 addresses remain with a secondary network interface when it is detached from an instance or attached to an instance.
- Although you can't detach the primary network interface from an instance, you can reassign the secondary private IPv4 address of the primary network interface to another network interface.

For more information, see the section called “Secondary IP addresses”.

EC2 instance hostnames

When you create an EC2 instance, AWS creates a hostname for that instance. For more information on the types of hostnames and how they're provisioned by AWS, see EC2 instance hostnames and domains. Amazon provides a DNS server that resolves Amazon-provided hostnames to IPv4 and IPv6 addresses. The Amazon DNS server is located at the base of your VPC network range plus two. For more information, see DNS attributes for your VPC in the *Amazon VPC User Guide*.

Link-local addresses

Amazon EC2 reserves specific IPv4 link-local addresses for services that are accessible only from an EC2 instance. These services run on the underlying host, not on the instance. When you access the reserved link-local addresses for these services, you're communicating with either the Xen hypervisor or the Nitro controller. The underlying host handles traffic to these reserved addresses instead of forwarding it according to customer-configured routes. Security groups and network ACLs do not filter this traffic.

AWS does not reserve every IPv4 address in `169.254.0.0/16`. Traffic to a non-reserved address in this range follows the applicable VPC route. Your security groups and network ACLs can filter this traffic.

Link-local address ranges

- IPv4 – 169.254.0.0/16 (169.254.0.0 to 169.254.255.255)
- IPv6 – fe80::/10

Services that you access using link-local addresses

- Instance Metadata Service – `169.254.169.254`
- Amazon Route 53 Resolver (also known as the Amazon DNS server) – `169.254.169.253`
- Amazon Time Sync Service – `169.254.169.123`
- AWS KMS servers

Manage the IPv4 addresses for your EC2 instances

You can assign a public IPv4 address to your instance when you launch it. You can view the IPv4 addresses for your instance in the console through either the **Instances** page or the **Network Interfaces** page.

Tasks

- Assign a public IPv4 address at launch
- Assign a private IPv4 address at launch
- View the primary IPv4 address
- View the IPv4 addresses using instance metadata

Assign a public IPv4 address at launch

Each subnet has an attribute that determines whether instances launched into that subnet are assigned a public IP address. By default, nondefault subnets have this attribute set to false, and default subnets have this attribute set to true. When you launch an instance, a public IPv4 addressing feature is also available for you to control whether your instance is assigned a public IPv4 address; you can override the default behavior of the subnet's IP addressing attribute. The public IPv4 address is assigned from Amazon's pool of public IPv4 addresses, and is assigned to the network interface with the device index of 0. This feature depends on certain conditions at the time you launch your instance.

Considerations

- You can unassign the public IP address from your instance after launch by managing the IP addresses associated with a network interface. For more information about public IPv4 addresses, see Public IPv4 addresses.
- You can't auto-assign a public IP address if you specify more than one network interface. Additionally, you cannot override the subnet setting using the auto-assign public IP feature if you specify an existing network interface for device index 0.
- Whether you assign a public IP address to your instance during launch or not, you can associate an Elastic IP address with your instance after it's launched. For more information, see Elastic IP addresses. You can also modify your subnet's public IPv4 addressing behavior. For more information, see Modify the public IPv4 addressing attribute for your subnet.

Console

To assign a public IPv4 address at launch

Follow the procedure to launch an instance, and when you configure Network Settings, choose the option to **Auto-assign Public IP**.

AWS CLI

To assign a public IPv4 address at launch

Use the run-instances command with the `--associate-public-ip-address` option.

```
--associate-public-ip-address
```

PowerShell

To assign a public IPv4 address at launch

Use the New-EC2Instance cmdlet with the `-AssociatePublicIp` parameter.

```
-AssociatePublicIp $true
```

Assign a private IPv4 address at launch

You can specify a private IPv4 address from the IPv4 address range of the subnet, or let Amazon EC2 chose one for you. This address is assigned to the primary network interface.

To assign IPv4 addresses after launch, see the section called “Assign secondary IP addresses to an instance”.

Console

To assign a private IPv4 address at launch

Follow the procedure to launch an instance. When you configure Network Settings, expand **Advanced network configuration** and enter a value for **Primary IP**.

AWS CLI

To assign a private IPv4 address at launch

Use the run-instances command with the `--private-ip-address` option.

```
--private-ip-addresses 10.251.50.12
```

To let Amazon EC2 choose the IP address, omit this option.

PowerShell

To assign a private IPv4 address at launch

Use the New-EC2Instance cmdlet with the `-PrivateIpAddress` parameter.

```
-PrivateIpAddress 10.251.50.12
```

To let Amazon EC2 choose the IP address, omit this parameter.

View the primary IPv4 address

The public IPv4 address is displayed as a property of the network interface in the console, but it's mapped to the primary private IPv4 address through NAT. Therefore, if you inspect the properties of your network interface on your instance, for example, through `ifconfig` (Linux) or `ipconfig` (Windows), the public IPv4 address is not displayed.

Console

To view the IPv4 addresses for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Networking** tab, find **Public IPv4 address** and **Private IPv4 addresses**.
5. (Optional) The **Networking** tab also contains the network interfaces and Elastic IP addresses for the instance.

AWS CLI

To view the primary IPv4 address for an instance

Use the describe-instances command.

```
aws ec2 describe-instances \
```

```
    --instance-ids i-1234567890abcdef0 \
    --query "Reservations[].Instances[].PrivateIpAddress" \
    --output text
```

The following is example output.

```
10.251.50.12
```

PowerShell

To view the primary IPv4 address for an instance

Use the Get-EC2Instance cmdlet.

```
(Get-EC2Instance `
    -InstanceId i-1234567890abcdef0).Instances.PrivateIpAddress
```

The following is example output.

```
10.251.50.12
```

View the IPv4 addresses using instance metadata

You can get the IPv4 addresses for your instance by retrieving instance metadata. For more information, see Use instance metadata to manage your EC2 instance.

To view the IPv4 addresses using instance metadata

1. Connect to your instance. For more information, see Connect to your EC2 instance.
2. Run one of the following commands.

   IMDSv2

   Linux

   Run the following command from your Linux instance.

```
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-
metadata-token-ttl-seconds: 21600"` \
```

```
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
meta-data/local-ipv4
```

Windows

Run the following command from your Windows instance.

```
[string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-
seconds" = "21600"} `
    -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} `
    -Method GET -Uri http://169.254.169.254/latest/meta-data/local-ipv4
```

IMDSv1

Linux

Run the following command from your Linux instance.

```
curl http://169.254.169.254/latest/meta-data/local-ipv4
```

Windows

Run the following command from your Windows instance.

```
Invoke-RestMethod http://169.254.169.254/latest/meta-data/local-ipv4
```

3. Use one of the following commands to access the public IP address. If there is an Elastic IP address associated with the instance, the command returns the Elastic IP address.

   IMDSv2

   Linux

   Run the following command from your Linux instance.

```
[ec2-user ~]$ TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H
 "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
```

```
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/
meta-data/public-ipv4
```

Windows

Run the following command from your Windows instance.

```
[string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-
seconds" = "21600"} `
    -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} `
    -Method GET -Uri http://169.254.169.254/latest/meta-data/public-ipv4
```

IMDSv1

Linux

Run the following command from your Linux instance.

```
curl http://169.254.169.254/latest/meta-data/public-ipv4
```

Windows

Run the following command from your Windows instance.

```
Invoke-RestMethod http://169.254.169.254/latest/meta-data/public-ipv4
```

Manage the IPv6 addresses for your EC2 instances

If your VPC and subnet have IPv6 CIDR blocks associated with them, you can assign an IPv6 address to your instance during or after launch. You can access the IPv6 addresses for your instances in the console on either the **Instances** page or the **Network Interfaces** page. The following tasks configure IP addresses for your instances. To configure IP addresses for your network interfaces instead, see the section called “Manage IP addresses”.

Tasks

- Assign an IPv6 address to an instance

- View the IPv6 addresses for an instance
- View IPv6 addresses using instance metadata
- Unassign an IPv6 address from an instance

Assign an IPv6 address to an instance

You can specify an IPv6 address from the IPv6 address range of the subnet, or let Amazon EC2 choose one for you. This address is assigned to the primary network interface. Note that the following instance types do not support IPv6 addresses: C1, M1, M2, M3, and T1.

Console

To assign an IPv6 address at launch

Follow the procedure to launch an instance. When you configure Network Settings, choose the option to **Auto-assign IPv6 IP**. If you don't see this option, the selected subnet does not have an associated IPv6 CIDR block.

To assign an IPv6 address after launch

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Assign new IP address**.
5. Enter an IPv6 address from the range of the subnet, or leave the field blank to let Amazon EC2 choose the IPv6 address for you. If you don't see this option, the instance subnet does not have an associated IPv6 CIDR block.
6. Choose **Save**.

AWS CLI

To assign an IPv6 address at launch

Use the run-instances command with the `--ipv6-addresses` option. The following example assigns two IPv6 addresses.

```
--ipv6-addresses Ipv6Address=2001:db8::1234:5678:1.2.3.4
 Ipv6Address=2001:db8::1234:5678:5.6.7.8
```

To let Amazon EC2 choose the IPv6 addresses, use the `--ipv6-address-count` option instead. The following example assigns two IPv6 addresses.

```
--ipv6-address-count 2
```

To assign an IPv6 address after launch

Use the assign-ipv6-addresses command. The following example assigns two IPv6 addresses.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --ipv6-addresses 2001:db8::1234:5678:1.2.3.4 2001:db8::1234:5678:5.6.7.8
```

To let Amazon EC2 choose the IPv6 addresses, use the `--ipv6-address-count` option instead. The following example assigns two IPv6 addresses.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --ipv6-address-count 2
```

PowerShell

To assign an IPv6 address at launch

Use the New-EC2Instance cmdlet with the `-Ipv6Address` parameter. The following example assigns two IPv6 addresses.

```
-Ipv6Address $ipv6addr1,$ipv6addr2
```

Define the IPv6 addresses as follows.

```
$ipv6addr1 = New-Object Amazon.EC2.Model.InstanceIpv6Address
$ipv6addr1.Ipv6Address = "2001:db8::1234:5678:1.2.3.4"
$ipv6addr2 = New-Object Amazon.EC2.Model.InstanceIpv6Address
$ipv6addr2.Ipv6Address = "2001:db8::1234:5678:5.6.7.8"
```

To let Amazon EC2 choose the IPv6 addresses, use the `-Ipv6AddressCount` parameter instead. The following example assigns two IPv6 addresses.

```
-Ipv6AddressCount 2
```

To assign an IPv6 address after launch

Use the Register-EC2Ipv6AddressList cmdlet. The following example assigns two IPv6 addresses.

```
Register-EC2Ipv6AddressList `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Ipv6Address "2001:db8::1234:5678:1.2.3.4","2001:db8::1234:5678:5.6.7.8"
```

To let Amazon EC2 choose the IPv6 addresses, use the `-Ipv6AddressCount` parameter instead. The following example assigns two IPv6 addresses.

```
Register-EC2Ipv6AddressList `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Ipv6AddressCount 2
```

View the IPv6 addresses for an instance

You can view the IPv6 addresses for your instances.

Console

To view the IPv6 addresses for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. On the **Networking** tab, locate **IPv6 addresses**.

AWS CLI

To view the IPv6 address for an instance

Use the describe-instances command.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0 \
    --query "Reservations[*].Instances[].Ipv6Address" \
```

```
    --output text
```

The following is example output.

```
2001:db8::1234:5678:1.2.3.4
```

PowerShell

To view the IPv6 address for an instance

Use the Get-EC2Instance cmdlet.

```
(Get-EC2Instance `
    -InstanceId i-1234567890abcdef0).Instances.Ipv6Address
```

The following is example output.

```
2001:db8::1234:5678:1.2.3.4
```

View IPv6 addresses using instance metadata

After you connect to your instance, you can retrieve the IPv6 addresses using instance metadata. First, you must get the MAC address of the instance from `http://169.254.169.254/latest/meta-data/network/interfaces/macs/`.

IMDSv2

Linux

Run the following command from your Linux instance.

```
TOKEN=`curl -X PUT "http://169.254.169.254/latest/api/token" -H "X-aws-ec2-metadata-token-ttl-seconds: 21600"` \
&& curl -H "X-aws-ec2-metadata-token: $TOKEN" http://169.254.169.254/latest/meta-data/network/interfaces/macs/mac-address/ipv6s
```

Windows

Run the following cmdlets from your Windows instance.

```
[string]$token = Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token-ttl-seconds"
 = "21600"} `
    -Method PUT -Uri http://169.254.169.254/latest/api/token
```

```
Invoke-RestMethod -Headers @{"X-aws-ec2-metadata-token" = $token} `
    -Method GET -Uri http://169.254.169.254/latest/meta-data/network/interfaces/
macs/mac-address/ipv6s
```

IMDSv1

Linux

Run the following command from your Linux instance.

```
curl http://169.254.169.254/latest/meta-data/network/interfaces/macs/mac-address/
ipv6s
```

Windows

Run the following cmdlet from your Windows instance.

```
Invoke-RestMethod -Uri http://169.254.169.254/latest/meta-data/network/interfaces/
macs/mac-address/ipv6s
```

Unassign an IPv6 address from an instance

You can unassign an IPv6 address from an instance at any time.

Console

To unassign an IPv6 address from an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface. Under **IPv6 addresses**, choose **Unassign** next to the IPv6 address.
5. Choose **Save**.

AWS CLI

To unassign an IPv6 address from an instance

Use the unassign-ipv6-addresses command.

```
aws ec2 unassign-ipv6-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --ipv6-addresses 2001:db8::1234:5678:1.2.3.4
```

PowerShell

To unassign an IPv6 address from an instance

Use the Unregister-EC2Ipv6AddressList cmdlet.

```
Unregister-EC2Ipv6AddressList `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Ipv6Address 2001:db8::1234:5678:1.2.3.4
```

Secondary IP addresses for your EC2 instances

The first IPv4 address assigned to a network interface is known as the primary IP address. Secondary IP addresses are additional IPv4 address assigned to a network interface. For more information, see the section called “Multiple IP addresses”.

You can also assign multiple IPv6 addresses to an instance. For more information, see the section called “IPv6 addresses”.

Tasks

- Assign secondary IP addresses to an instance
- Configure the operating system to use secondary IP addresses
- Unassign a secondary IP address from an instance

Assign secondary IP addresses to an instance

You can assign secondary IP addresses to the network interface for an instance as you launch the instance, or after the instance is running.

Console

To assign a secondary IP address at launch

1. Follow the procedure to launch an instance. When you configure Network Settings, expand **Advanced network configuration**.
2. For **Secondary IP**, choose **Automatically assign** and enter the number of IP addresses for Amazon EC2 to assign. Alternatively, choose **Manually assign** and enter the IPv4 addresses.
3. Complete the remaining steps to launch the instance.

To assign a secondary IP address after launch

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select your instance, and choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface.
5. To add an IPv4 address, under **IPv4 addresses**, choose **Assign new IP address**. Enter an IPv4 address from the range of the subnet, or leave the field blank to let Amazon EC2 choose one for you.
6. Choose **Save**.

AWS CLI

To assign a secondary IP address at launch

Use the run-instances command with the `--secondary-private-ip-addresses` option.

```
--secondary-private-ip-addresses 10.251.50.12
```

To let Amazon EC2 choose the IP address, use the `--secondary-private-ip-address-count` option instead. The following example assigns one secondary IP address.

```
--secondary-private-ip-address-count 1
```

Alternatively, you can create a network interface. For more information, see the section called "Create a network interface".

To assign a secondary IP address after launch

Use the assign-private-ip-addresses command with the `--private-ip-addresses` option.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-ids eni-1234567890abcdef0 \
    --private-ip-addresses 10.251.50.12
```

To let Amazon EC2 choose the IPv4 address, use the `--secondary-private-ip-address-count` parameter instead. The following example assigns one IPv4 address.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-ids eni-1234567890abcdef0 \
    --secondary-private-ip-address-count 1
```

PowerShell

To assign a secondary IP address at launch

You must create a network interface. For more information, see the section called "Create a network interface".

To assign a secondary IP address after launch

Use the Register-EC2PrivateIpAddress cmdlet with the `-PrivateIpAddress` parameter.

```
Register-EC2PrivateIpAddress `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -PrivateIpAddress 10.251.50.12
```

To let Amazon EC2 choose the IPv4 addresses, use the `-SecondaryPrivateIpAddressCount` parameter instead. The following example assigns one IPv4 address.

```
Register-EC2PrivateIpAddress `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -SecondaryPrivateIpAddressCount 1
```

Configure the operating system to use secondary IP addresses

After you assign a secondary IP address to your instance, you must configure the operating system on your instance to recognize the additional private IPv4 address.

Linux instances

- If you are using Amazon Linux, the ec2-net-utils package can take care of this step for you. It configures additional network interfaces that you attach while the instance is running, refreshes secondary IPv4 addresses during DHCP lease renewal, and updates the related routing rules. You can immediately refresh the list of interfaces by using one of the following commands, depending on your system: `sudo systemctl restart systemd-networkd` (AL2023) or `sudo service network restart` (Amazon Linux 2). You can view the up-to-date list using the following command: `ip addr li`. If you require manual control over your network configuration, you can remove the ec2-net-utils package. For more information, see Configure your network interface using ec2-net-utils.
- If you are using another Linux distribution, see the documentation for your Linux distribution. Search for information about configuring additional network interfaces and secondary IPv4 addresses. If the instance has two or more interfaces on the same subnet, search for information about using routing rules to work around asymmetric routing.

Windows instances

For more information, see Configure secondary private IPv4 addresses for Windows instances.

Unassign a secondary IP address from an instance

If you no longer require a secondary IP address, you can unassign it from the instance or the network interface. When a secondary private IPv4 address is unassigned from a network interface, the Elastic IP address (if it exists) is also disassociated.

Console

To unassign a secondary private IPv4 address from an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select an instance, choose **Actions**, **Networking**, **Manage IP addresses**.
4. Expand the network interface. For **IPv4 addresses**, choose **Unassign** for the IPv4 address to unassign.
5. Choose **Save**.

AWS CLI

To unassign a secondary private IP address

Use the unassign-private-ip-addresses command.

```
aws ec2 unassign-private-ip-addresses \
    --network-interface eni-1234567890abcdef0\
    --private-ip-addresses 10.251.50.12
```

PowerShell

To unassign a secondary private IP address

Use the Unregister-EC2PrivateIpAddress cmdlet.

```
Unregister-EC2PrivateIpAddress `
    -NetworkInterface eni-1234567890abcdef0 `
    -PrivateIpAddress 10.251.50.12
```

Configure secondary private IPv4 addresses for Windows instances

You can specify multiple private IPv4 addresses for your instances. After you assign a secondary private IPv4 address to an instance, you must configure the operating system on the instance to recognize the secondary private IPv4 address.

> **Note**
>
> These instructions are based on Windows Server 2022. The implementation of these steps might vary based on the operating system of the Windows instance.

Tasks

- Prerequisites
- Step 1: Configure static IP addressing in your instance
- Step 2: Configure a secondary private IP address for your instance
- Step 3: Configure applications to Use the secondary private IP address

Prerequisites

- Assign the secondary private IPv4 address to the network interface for the instance. You can assign the secondary private IPv4 address when you launch the instance, or after the instance is running. For more information, see Assign secondary IP addresses to an instance.

Step 1: Configure static IP addressing in your instance

To enable your Windows instance to use multiple IP addresses, you must configure your instance to use static IP addressing rather than a DHCP server.

> **Important**
>
> When you configure static IP addressing in your instance, the IP address must match exactly what is shown in the console, CLI, or API. If you enter these IP addresses incorrectly, the instance could become unreachable.

To configure static IP addressing on a Windows instance

1. Connect to your instance.
2. Find the IP address, subnet mask, and default gateway addresses for the instance by performing the following steps:

   - Run the following command in PowerShell:

     ```
     ipconfig /all
     ```

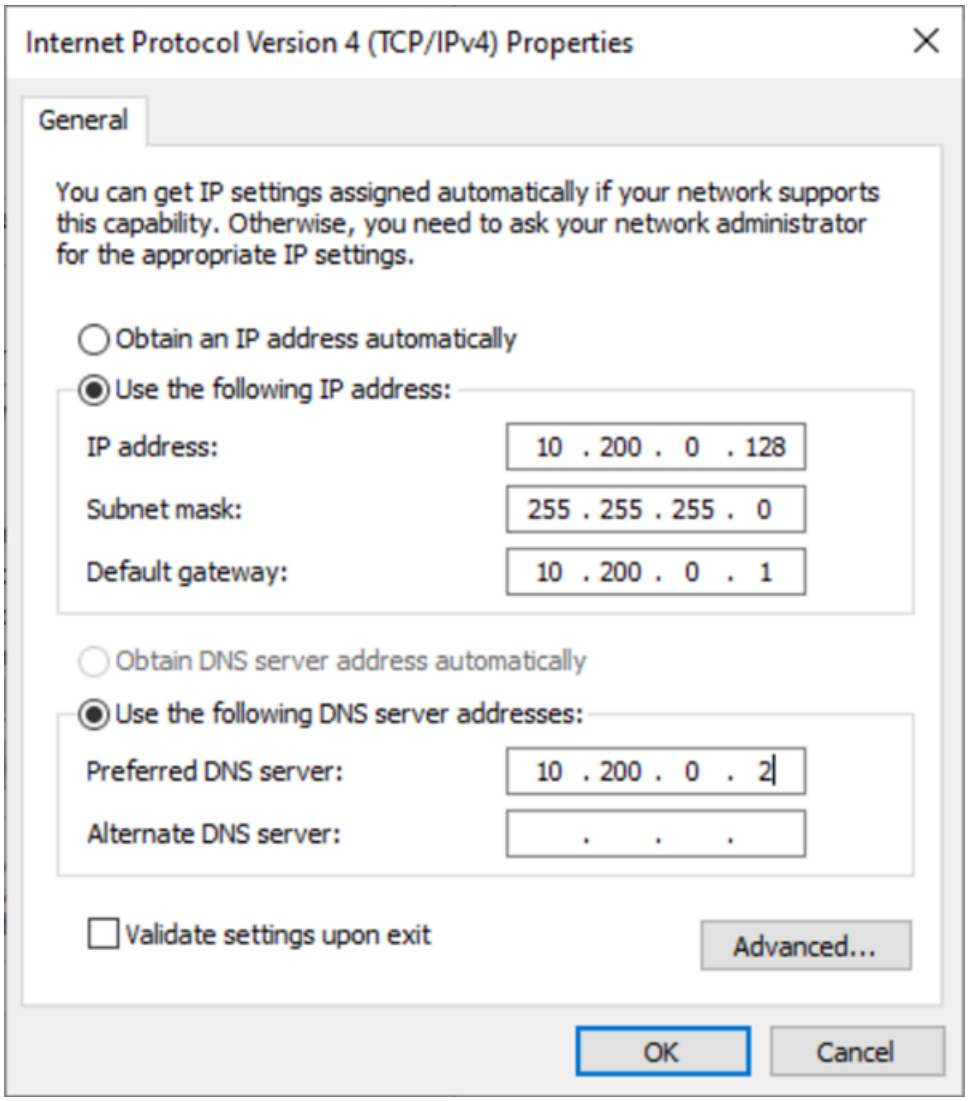
     Review the output and note the **IPv4 Address**, **Subnet Mask**, **Default Gateway**, and **DNS Servers** values for the network interface. Your output should resemble the following example:

     ```
     ...

     Ethernet adapter Ethernet 4:

        Connection-specific DNS Suffix  . : us-west-2.compute.internal
        Description . . . . . . . . . . . : Amazon Elastic Network Adapter #2
        Physical Address. . . . . . . . . : 02-9C-3B-FC-8E-67
     ```

```
   DHCP Enabled. . . . . . . . . . . : Yes
   Autoconfiguration Enabled . . . . : Yes
   Link-local IPv6 Address . . . . . : fe80::f4d1:a773:5afa:cd1%7(Preferred)
   IPv4 Address. . . . . . . . . . . : 10.200.0.128(Preferred)
   Subnet Mask . . . . . . . . . . . : 255.255.255.0
   Lease Obtained. . . . . . . . . . : Monday, April 8, 2024 12:19:29 PM
   Lease Expires . . . . . . . . . . : Monday, April 8, 2024 4:49:30 PM
   Default Gateway . . . . . . . . . : 10.200.0.1
   DHCP Server . . . . . . . . . . . : 10.200.0.1
   DHCPv6 IAID . . . . . . . . . . . : 151166011
   DHCPv6 Client DUID. . . . . . . . : 00-01-00-01-2D-67-AC-FC-12-34-9A-BE-A5-
E7
   DNS Servers . . . . . . . . . . . : 10.200.0.2
   NetBIOS over Tcpip. . . . . . . . : Enabled
```



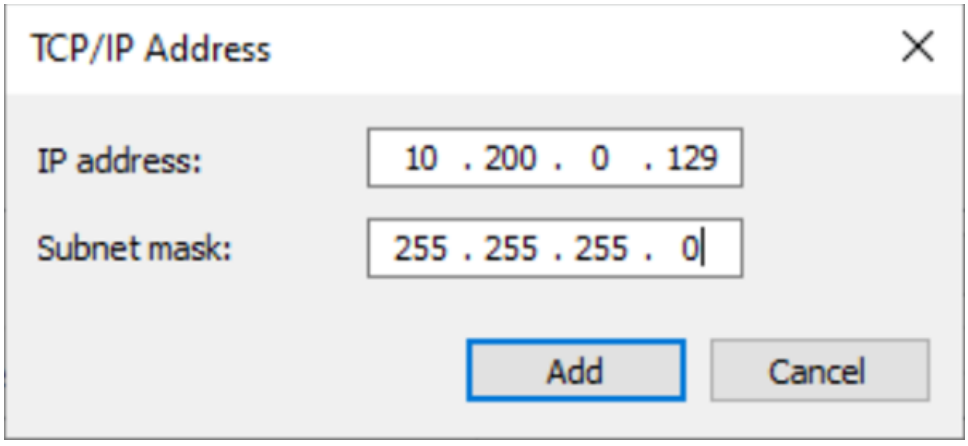
3. Open the **Network and Sharing Center** by running the following command in PowerShell:

```
& $env:SystemRoot\system32\control.exe ncpa.cpl
```

4. Open the context (right-click) menu for the network interface (Local Area Connection or Ethernet) and choose **Properties**.
5. Choose **Internet Protocol Version 4 (TCP/IPv4)**, **Properties**.
6. In the **Internet Protocol Version 4 (TCP/IPv4) Properties** dialog box, choose **Use the following IP address**, enter the following values, and then choose **OK**.

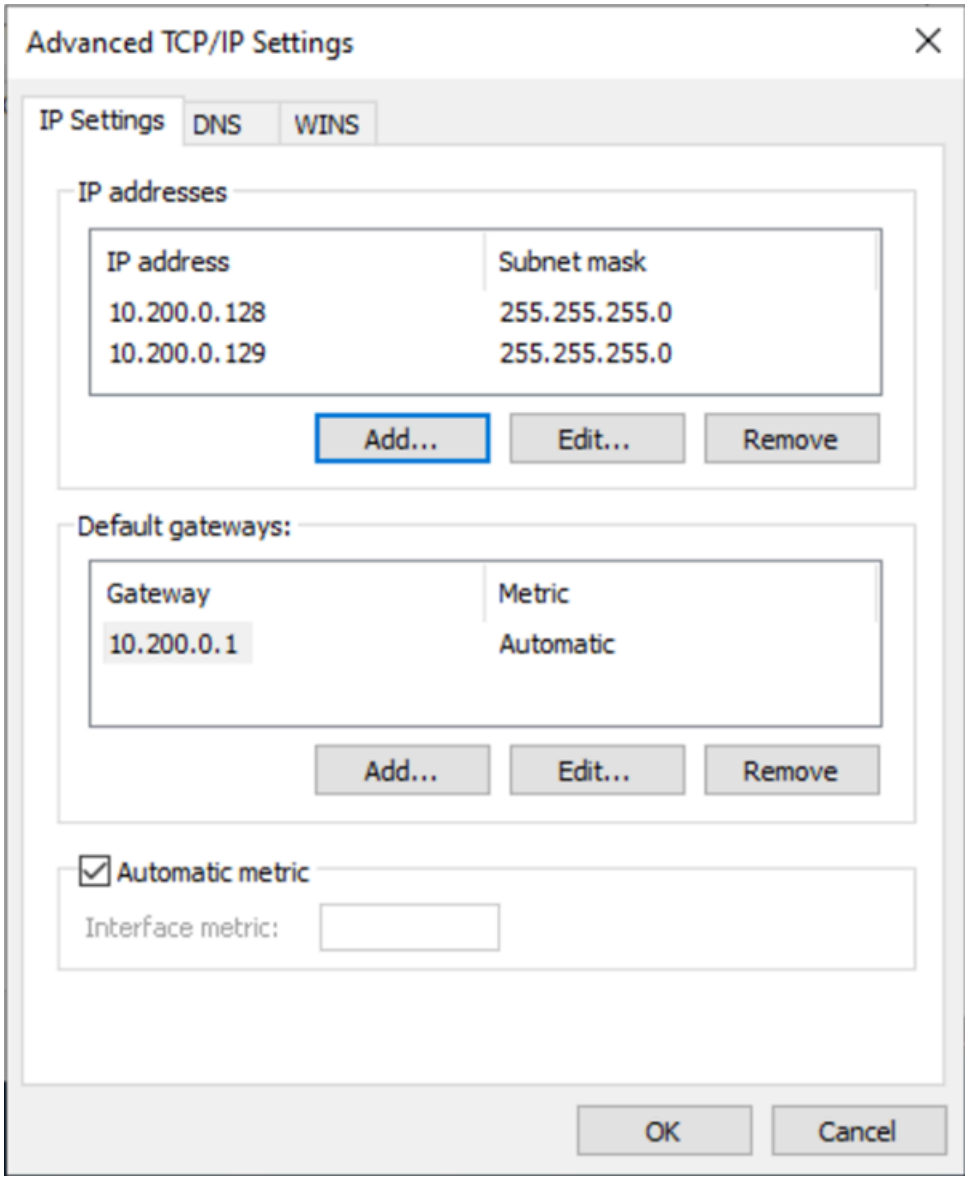
Field	Value
IP address	The IPv4 address obtained in step 2 above.
Subnet mask	The subnet mask obtained in step 2 above.
Default gateway	The default gateway address obtained in step 2 above.
Preferred DNS server	The DNS server obtained in step 2 above.
Alternate DNS server	The alternate DNS server obtained in step 2 above. If an alternate DNS server was not listed, leave this field blank.

> **Important**
>
> If you set the IP address to any value other than the current IP address, you will lose connectivity to the instance.



You will lose RDP connectivity to the Windows instance for a few seconds while the instance converts from using DHCP to static addressing. The instance retains the same IP address information as before, but now this information is static and not managed by DHCP.

Step 2: Configure a secondary private IP address for your instance



After you have set up static IP addressing on your Windows instance, you are ready to prepare a second private IP address.

To configure a secondary IP address

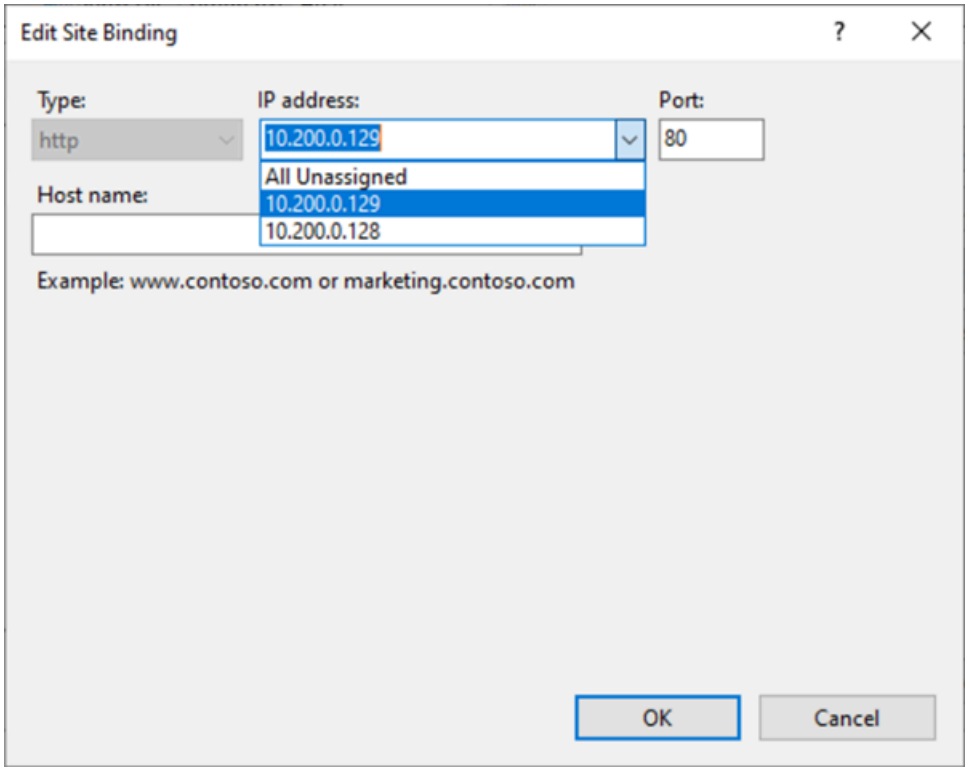
1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances** and select your instance.
3. On the **Networking**, note the secondary IP address.
4. Connect to your instance.
5. On your Windows instance, choose **Start**, **Control Panel**.
6. Choose **Network and Internet**, **Network and Sharing Center**.
7. Select the network interface (Local Area Connection or Ethernet) and choose **Properties**.
8. On the **Local Area Connection Properties** page, choose **Internet Protocol Version 4 (TCP/IPv4)**, **Properties**, **Advanced**.
9. Choose **Add**.
10. In the **TCP/IP Address** dialog box, type the secondary private IP address for **IP address**. For **Subnet mask**, type the same subnet mask that you entered for the primary private IP address in Step 1: Configure static IP addressing in your instance, and then choose **Add**.

11. Verify the IP address settings and choose **OK**.

12. Choose **OK**, **Close**.
13. To confirm that the secondary IP address has been added to the operating system, run the `ipconfig /all` command in PowerShell. Your output should resemble the following:

```
Ethernet adapter Ethernet 4:

   Connection-specific DNS Suffix  . :
   Description . . . . . . . . . . . : Amazon Elastic Network Adapter #2
   Physical Address. . . . . . . . . : 02-9C-3B-FC-8E-67
   DHCP Enabled. . . . . . . . . . . : No
   Autoconfiguration Enabled . . . . : Yes
   Link-local IPv6 Address . . . . . : fe80::f4d1:a773:5afa:cd1%7(Preferred)
   IPv4 Address. . . . . . . . . . . : 10.200.0.128(Preferred)
```



```
   Subnet Mask . . . . . . . . . . . : 255.255.255.0
   IPv4 Address. . . . . . . . . . . : 10.200.0.129(Preferred)
   Subnet Mask . . . . . . . . . . . : 255.255.255.0
   Default Gateway . . . . . . . . . : 10.200.0.1
   DHCPv6 IAID . . . . . . . . . . . : 151166011
   DHCPv6 Client DUID. . . . . . . . : 00-01-00-01-2D-67-AC-FC-12-34-9A-BE-A5-E7
   DNS Servers . . . . . . . . . . . : 10.200.0.2
   NetBIOS over Tcpip. . . . . . . . : Enabled
```

Step 3: Configure applications to Use the secondary private IP address

You can configure any applications to use the secondary private IP address. For example, if your instance is running a website on IIS, you can configure IIS to use the secondary private IP address.

To configure IIS to use the secondary private IP address

1. Connect to your instance.
2. Open Internet Information Services (IIS) Manager.
3. In the **Connections** pane, expand **Sites**.
4. Open the context (right-click) menu for your website and choose **Edit Bindings**.
5. In the **Site Bindings** dialog box, for **Type**, choose **http**, **Edit**.
6. In the **Edit Site Binding** dialog box, for **IP address**, select the secondary private IP address. (By default, each website accepts HTTP requests from all IP addresses.)

7. Choose **OK**, **Close**.

EC2 instance hostnames and domains

Understanding EC2 instance hostnames and domains is important for effectively managing and accessing your Amazon EC2 instances. Each EC2 instance can have different types of hostnames - private and public - that serve different purposes and follow specific naming conventions.

This topic explains the structure of EC2 instance hostnames, how they're constructed, and the different hostname types available. You'll learn how to view and modify hostname settings, understand when to use each type, and learn best practices for hostname management in your AWS environment.

Contents

- Understanding EC2 instance hostnames and domains
- Hostname types

Understanding EC2 instance hostnames and domains

A EC2 instance address is made up of different components. The following is an example of an EC2 instance address that uses the private IPv4 address of the instance:

```
   IP address         Domain name
   #--------# #-----------------------#
ip-10-24-34-0.us-west-2.compute.internal
#-----------#
  Hostname
#-------------------------------------#
    Fully qualified domain name (FQDN)
```

Where:

- **IP address**: The primary IPv4 address of the primary network interface associated with an instance.
- **Hostname**: The local name of a specific EC2 instance (used by the operating system and for local network identification)
- **Domain name**: The part of the FQDN that AWS provides
- **Fully qualified domain name (FQDN)**: The complete address that includes both the hostname and the domain name. This is the full, globally unique identifier used to reach your instance across networks.

Depending on the hostname type you choose for the instance or primary network interface attached to the instance, the hostname and domain name formats will be different from the example above. This section explains the hostname type options.

Hostname types

AWS provides two types of hostnames: **private** and **public**. The following table compares the key differences between private and public hostnames, including how they resolve, how they're configured, and when to use each type.

	Private hostnames	Public hostnames
DNS resolution	Private hostnames enable private FQDNs that are not accessible	Public hostnames enable public FQDNs that are accessible from the

	Private hostnames	Public hostnames
	from the public internet. Private hostnames only allow requests to resolve to private IPv4 and IPv6 GUA addresses within the VPC.	public internet. Public hostnames enable requests to resolve to private IPv4 and IPv6 GUA within the VPC and public IPs from the internet (split-horizon DNS).
Configuration	Private hostnames are configured at the instance level.	Public hostnames are configured at the network interface level.
When to use	• For hostnames that resolve only within your VPC, for internal communication • To keep your internal naming scheme private • To simplify internal resource management without external DNS considerations	• To access instances over both IPv4 and IPv6 from the internet • To enable smooth migration from IPv4 to IPv6 environments

Contents

- Public hostnames
- Private hostnames

Public hostnames

You can use *public hostnames* to access EC2 instances using hostnames that resolve to the public IPv4 or IPv6 address of the instance and ease your transition to IPv6.

Public hostnames allow you to:

- Access your EC2 instances over both IPv4 and IPv6, giving you more flexibility in how you connect to your resources.
- Migrate from IPv4 to IPv6 environments at your own pace. You can, for example, decouple your database and application migrations, reducing complexity and risk.

- Use multiple hostname options (IPv4-only, IPv6-only, and dual-stack) that automatically resolve to the appropriate IP addresses.
- Benefit from improved security with split-horizon DNS, which resolves hostnames to private IP addresses when queried from within your VPC.

Contents

- Public hostname types and when to use them
- View public hostnames
- Modify public hostnames types

Public hostname types and when to use them

To use public hostnames, you have to modify an existing network interface. This section describes the three public hostname type options and helps you decide which to use:

- **Dual-stack - IP based name**
  - This is the best option if you are migrating or planning to migrate from IPv4 to IPv6. This option allows for connectivity over both IPv4 and IPv6, giving flexibility to clients that may be using either protocol and enables clients to keep the same hostname throughout the migration to IPv6.
  - Requests from within the VPC resolve to both the private IPv4 address and the IPv6 Global Unicast Address (GUA) of the network interface. Requests from the internet resolve to both the public IPv4 and the IPv6 GUA address of the network interface.
  - **Example**
    - When you choose this option, a dual-stack FQDN will be generated for this network interface. This is an example of the FQDN that will be generated:
      - f5lnz-0khrm-nt2u3-gyqqt-nbdl5-q3cdpO.ap-southeast-2.ip.aws
    - Where:
      - f5lnz-0khrm-nt2u3-gyqqt-nbdl5-q3cdpO is the hostname that is a base36 representation of the primary public IPv6 address (f5lnz-0khrm-nt2u3-gyqqt-nbdl5) on the network interface along with a base36 representation of the primary public IPv4 address (q3cdpO) on the network interface.

    - f5lnz-0khrm-nt2u3-gyqqt-nbdl5 is resolved by the Amazon DNS resolver to the IPv6 GUA address FFFF:1407:4:f000:81d:2689:1066:4489. This is the first IPv6 GUA assigned to the network interface.
    - q3cdpO is resolved to the IPv4 address of 52.54.55.56. This is the public IPv4 address attached to the primary network interface.
    - ap-southeast-2 is the Region of the subnet that the network interface is in.
    - ip.aws is the domain provided by AWS.
- **IPv6 - IP based name**
  - This is a good option if you have already migrated to IPv6 and require connectivity only over IPv6.
  - Requests from within the VPC or from the internet resolve to the IPv6 GUA of the network interface.
  - **Example**
    - When you choose this option, a FQDN will be generated for this network interface. This is an example of the FQDN that will be generated:
      - f5lnz-0khrm-nt2u3-gyqqt-nbdl5.ap-southeast-2.ip.aws
    - Where:
      - f5lnz-0khrm-nt2u3-gyqqt-nbdl5 is a hostname that is a base36 representation of the primary public IPv6 address on the network interface.
      - f5lnz-0khrm-nt2u3-gyqqt-nbdl5 is resolved by the Amazon DNS resolver to the IPv6 GUA address FFFF:1407:4:f000:81d:2689:1066:4489. This is the first IPv6 GUA assigned to the network interface.
      - ap-southeast-2 is the Region of the subnet that the network interface is in.
      - ip.aws is the domain provided by AWS.
- **IPv4 - IP based name**
  - This is a good option if the instance using this network interface need to maintain IPv4 access during the transition to IPv6 or if applications or systems running on the instance only support IPv4. This is the best option if you only need to maintain IPv4 connectivity and your workloads don't require IPv6 support. For example, if you are migrating to IPv6, you may decide to keep some applications on IPv4 while others move to IPv6.
  - Requests from within the VPC resolve to the private primary IPv4 address of the network interface. Requests from the internet resolve to the public IPv4 address of the network interface.

- **Example**
  - If you choose this option, an IPv4-enabled public hostname will be generated for this network interface. This is an example of the DNS name that will be generated:
    - ec2-52-54-55-66.ap-southeast-2.compute.amazonaws.com
  - Where:
    - ec2-52-54-55-66 is a hostname derived from the primary public IPv4 address of the network interface, using the format ec2- followed by the IP address with dots replaced by hyphens.
    - ec2-52-54-55-66 resolves to the IPv4 address of 52.54.55.66. This is the public IPv4 address attached to the primary network interface.
    - ap-southeast-2 is the Region of the subnet that the network interface is in.
    - compute.amazonaws.com is the domain provided by AWS for IPv4-based public hostnames.

> **Important**
>
> In the examples above, you can see that IP addresses are used to generate the hostname. If you change the primary private IPv4 address or the first IPv6 GUA assigned to the network interface, the portion of the hostname that translates to the IP address will change and **the previously-generated public hostname will no longer be valid**. In addition, changing the primary IPv4 public address forces a downstream refresh of Instance Metadata Service (IMDS) in the *Amazon EC2 User Guide*, so the EC2 instance IMDS metadata is automatically updated.

View public hostnames

If the VPC that the network interface is in does not have both EnableDnsHostnames and EnableDnsSupport enabled, there is no hostname type defined or generated.

Console

You can view the public hostnames for an instance or primary network interface.

To view the hostname type and DNS names of an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance.
4. On the **Network** tab, under **Hostname and DNS**, find the following:

   - **Public hostname type**
   - **Public DNS**
   - **IPv4-only IP based name**
   - **IPv6-only - IP based name**
   - **Dualstack - IP based name**

To view the hostname type and DNS names of a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. In the search field, enter the ID of the instance. Select the ID of the network interface to open its details page.
4. Under **Hostname and DNS**, find the following:

   - **Public hostname type**
   - **Public DNS name**
   - **Public IPv4 DNS name**
   - **Public IPv6 DNS name**
   - **Public Dualstack DNS name**

AWS CLI

To view the hostname type and DNS names of a network interface

Use the describe-network-interfaces command.

```
aws ec2 describe-network-interfaces \
    --network-interface-id eni-1234567890abcdef0 \
    --query NetworkInterfaces[].PublicIpDnsNameOptions
```

The following is example output. Because the hostname type is `public-dual-stack-dns-name`, the DNS hostname is the same as `PublicDualStackDnsName`.

```
[
     {
          "DnsHostnameType": "public-dual-stack-dns-name",
          "PublicIpv4DnsName": "ec2-52-54-55-66.ap-
southeast-2.compute.amazonaws.com",
          "PublicIpv6DnsName": "f5lnz-0khrm-nt2u3-gyqqt-nbdl5.ap-
southeast-2.ip.aws",
          "PublicDualStackDnsName": "f5lnz-0khrm-nt2u3-gyqqt-nbdl5-q3cdp0.ap-
southeast-2.ip.aws"
     }
]
```

PowerShell

To view the hostname type and DNS names of a network interface

Use the Get-EC2NetworkInterface cmdlet.

```
(Get-EC2NetworkInterface `
    -NetworkInterfaceId eni-1234567890abcdef0).PublicIpDnsNameOptions
```

The following is example output. Because the hostname type is `public-dual-stack-dns-name`, the DNS hostname is the same as `PublicDualStackDnsName`.

```
DnsHostnameType        : public-dual-stack-dns-name
PublicDualStackDnsName : f5lnz-0khrm-nt2u3-gyqqt-nbdl5-q3cdp0.ap-southeast-2.ip.aws
PublicIpv4DnsName      : ec2-52-54-55-66.ap-southeast-2.compute.amazonaws.com
PublicIpv6DnsName      : f5lnz-0khrm-nt2u3-gyqqt-nbdl5.ap-southeast-2.ip.aws
```

Modify public hostnames types

The public hostname type options depend on the IP addresses associated with the network interface:

- If the network interface has only a public IPv4 address, the hostname type must be **IPv4 - IP based name**.
- If the network interface has only an IPv6 address, the hostname type must be **IPv6 - IP based name**.
- If the network interface has both a public IPv4 address and an IPv6 address, the hostname type can be **Dual-stack - IP based name**.

Prerequisites

- The network interface must have an associated public IPv4 address or an IPv6 address.
- The VPC that the network interface is in must have EnableDnsHostnames and EnableDnsSupport enabled. See View and update DNS attributes for your VPC in the *Amazon VPC User Guide*.

Console

To modify the public hostname type

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. In the search field, enter the ID of the instance. Select the checkbox for the network interface.

   Alternatively, from the instance detail page, choose the **Networking** tab and select the ID of the network interface for device index 0.
4. Choose **Actions**, **Modify public hostname type**.
5. Choose an option:

   - **Dual-stack - IP based name**: A dual-stack public hostname for a network interface. Requests from within the VPC resolve to both the private IPv4 address and the IPv6 Global Unicast Address of the network interface. Requests from the internet resolve to both the public IPv4 and the IPv6 GUA address of the network interface.
   - **IPv4 - IP based name**: An IPv4-enabled public hostname for a network interface. Requests from within the VPC resolve to the private primary IPv4 address of the network interface. Requests from the internet resolve to the public IPv4 address of the network interface.
   - **IPv6 - IP based name**: An IPv6-enabled public hostname for a network interface. Requests from within the VPC or from the internet resolve to the IPv6 GUA of the network interface.
6. Choose **Modify**.

AWS CLI

To modify the public hostname type

Use the modify-public-ip-dns-name-options command.

```
aws ec2 modify-public-ip-dns-name-options \
    --network-interface-id eni-1234567890abcdef0 \
    --hostname-type public-dual-stack-dns-name
```

The following is example output.

```
{
    "Successful": true
}
```

PowerShell

To modify the public hostname type

Use the Edit-EC2PublicIpDnsNameOption cmdlet.

```
Edit-EC2PublicIpDnsNameOption `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -HostNameType public-dual-stack-dns-name
```

Private hostnames

This section describes the Amazon EC2 instance private hostnames available when you launch instances into your VPC subnets.

The private hostname distinguishes the EC2 instances on your network. You may use the private hostname of an instance if, for example, you want to run scripts to communicate with some or all of the instances on your network.

Contents

- Private hostname types
- Where to find resource names and IP names
- Choosing between resource names and IP names
- Change resource based naming options for Amazon EC2

Private hostname types

There are two private hostname types for the guest OS hostname when EC2 instances are launched in a VPC:

- **IP name**: The legacy naming scheme where, when you launch an instance, the *private IPv4 address* of the instance is included in the hostname of the instance. The IP name exists for the life of the EC2 instance. When used as the Private DNS hostname, it will only return the private IPv4 address (A record).
- **Resource name**: When you launch an instance, the *EC2 instance ID* is included in the hostname of the instance. The resource name exists for the life of the EC2 instance. When used as the Private DNS hostname, it can return both the private IPv4 address (A record) and/or the IPv6 Global Unicast Address (AAAA record).

The EC2 instance guest OS hostname type depends on the subnet settings:

- If the instance is launched into an IPv4-only subnet, you can select either IP name or resource name.
- If the instance is launched into a dual-stack (IPv4+IPv6) subnet, you can select either IP name or resource name.
- If the instance is launched into an IPv6-only subnet, resource name is used automatically.

Contents

- IP name
- Resource name
- The difference between IP name and Resource name

IP name

When you launch an EC2 instance with the **Hostname type** of **IP name**, the guest OS hostname is configured to use the private IPv4 address.

- Format for an instance in us-east-1: *`private-ipv4-address`*`.ec2.internal`
- Example: *`ip-10-24-34-0`*`.ec2.internal`
- Format for an instance in any other AWS Region: *`private-ipv4-address.region`*`.compute.internal`

- Example: *ip-10-24-34-0.us-west-2*.compute.internal

Resource name

When you launch EC2 instances in IPv6-only subnets, the **Hostname type** of **Resource name** is selected by default. When you launch an instance in IPv4-only or dual-stack (IPv4+IPv6) subnets, **Resource name** is an option that you can select. After you launch an instance, you can manage the hostname configuration. For more information, see Change resource based naming options for Amazon EC2.

When you launch an EC2 instance with a **Hostname type** of **Resource name**, the guest OS hostname is configured to use the EC2 instance ID.

- Format for an instance in us-east-1: *ec2-instance-id*.ec2.internal
- Example: *i-0123456789abcdef*.ec2.internal
- Format for an instance in any other AWS Region: *ec2-instance-id.region*.compute.internal
- Example: *i-0123456789abcdef.us-west-2*.compute.internal

The difference between IP name and Resource name

DNS queries for both IP names and resource names coexist to ensure backward compatibility and to allow you to migrate from IP based-naming for hostnames to resource-based naming. For private DNS hostnames based on IP names, you cannot configure whether a DNS A record query for the instance is responded to or not. DNS A record queries are always responded to irrespective of the guest OS hostname settings. In contrast, for private DNS hostnames based on resource name, you can configure whether DNS A and/or DNS AAAA queries for the instance are responded to or not. You configure the response behavior when you launch an instance or modify a subnet. For more information, see Change resource based naming options for Amazon EC2.

Where to find resource names and IP names

You can see the hostname types, resource name and IP name, in the Amazon EC2 console.

Contents

- When creating an EC2 instance
- When viewing the details of an existing EC2 instance

When creating an EC2 instance

When you create an EC2 instance, depending on which type of subnet you select, **Hostname type** of **Resource name** might be available or it might be selected and not be modifiable. This section explains the scenarios in which you see the hostname types resource name and IP name.

Scenario 1

You create an EC2 instance in the wizard (see Launch an EC2 instance using the launch instance wizard in the console) and, when you configure the details, you choose a subnet that you configured to be IPv6-only.

In this case, the **Hostname type** of **Resource name** is selected automatically and is not modifiable. **DNS Hostname** options of **Enable IP name IPv4 (A record) DNS requests** and **Enable resource-based IPv4 (A record) DNS requests** are deselected automatically and are not modifiable. **Enable resource-based IPv6 (AAAA record) DNS requests** is selected by default but is modifiable. If selected, DNS requests to the resource name will resolve to the IPv6 address (AAAA record) of this EC2 instance.

Scenario 2

You create an EC2 instance in the wizard (see Launch an EC2 instance using the launch instance wizard in the console) and, when you configure the details, you choose a subnet configured with an IPv4 CIDR block or both an IPv4 and IPv6 CIDR block ("dual stack").

In this case, **Enable IP name IPv4 (A record) DNS requests** is selected automatically and can't be changed. This means that requests to the IP name will resolve to the IPv4 address (A record) of this EC2 instance.

The options default to the configurations of the subnet, but you can modify the options for this instance depending on the subnet settings:

- **Hostname type**: Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name. The default value is **IP name**.
- **Enable resource-based IPv4 (A record) DNS requests**: Determines whether requests to your resource name resolve to the private IPv4 address (A record) of this EC2 instance. This option is not selected by default.
- **Enable resource-based IPv6 (AAAA record) DNS requests**: Determines whether requests to your resource name resolve to the IPv6 GUA address (AAAA record) of this EC2 instance. This option is not selected by default.

When viewing the details of an existing EC2 instance

You can see the hostname values for an existing EC2 instance in the **Details** tab for the EC2 instance:

- **Hostname type**: The hostname in IP name or resource name format.
- **Private IP DNS name (IPv4 only)**: The IP name that will always resolve to the private IPv4 address of the instance.
- **Private resource DNS name**: The resource name that resolves to the DNS records selected for this instance.
- **Answer private resource DNS name**: The resource name resolves to IPv4 (A), IPv6 (AAAA) or IPv4 and IPv6 (A and AAAA) DNS records.

In addition, if you connect to your EC2 instance directly over SSH and enter the `hostname` command, you'll see the hostname in either the IP name or resource name format.

Choosing between resource names and IP names

When you launch an EC2 instance (see Launch an EC2 instance using the launch instance wizard in the console), if you choose a **Hostname type** of **Resource name**, the EC2 instance launches with a hostname in the resource name format. In such cases, the DNS record for this EC2 instance can also point to the resource name. This gives you the flexibility to choose whether that hostname resolves to the IPv4 address, the IPv6 address, or both the IPv4 and IPv6 address of the instance. If you plan to use IPv6 in the future or if you are using dual-stack subnets today, it's best to use a **Hostname type** of **Resource name** so that you change DNS resolution for the hostnames of your instances without making any changes to the DNS records themselves. The resource name allows you to add and remove IPv4 and IPv6 DNS resolution on an EC2 instance.

If instead you choose a **Hostname type** of **IP name**, and use it as the DNS hostname, it can only resolve to the IPv4 address of the instance. It will not resolve to the IPv6 address of the instance even if the instance has both an IPv4 address and an IPv6 address associated with it.

Change resource based naming options for Amazon EC2

You can change the hostname type and DNS hostname configurations for subnets, which affects all subsequent instance launches in that subject, or you can change them for an EC2 instances after you launch it.

Resource based naming options

- **Hostname type**: Determines the default setting for the guest OS hostname of EC2 instances launched in the subnet. This is either the resource name or IP name.
- **Enable DNS hostname IPv4 (A record) requests**: Determines whether DNS requests/queries to the resource name resolve to the private IPv4 address (A record) of the EC2 instance.
- **Enable DNS hostname IPv6 (AAAA record) requests**: Determines whether DNS requests/queries to the resource name resolve to the IPv6 address (AAAA record) of the EC2 instance.

Subnets

Changing the subnet settings doesn't change the configuration of EC2 instances that are already launched in the subnet.

Console

To modify the options for a subnet

Open the Amazon VPC console and select the subnet. Choose **Actions**, **Edit subnet settings**. Modify the settings as needed and then save your changes.

AWS CLI

To modify the options for a subnet

Use the modify-subnet-attribute command.

```
aws ec2 modify-subnet-attribute \
    --subnet-id subnet-0abcdef1234567890 \
    --private-dns-hostname-type-on-launch resource-name \
    --enable-resource-name-dns-a-record-on-launch \
    --enable-resource-name-dns-aaaa-record-on-launch
```

PowerShell

To modify the options for a subnet

Use the Edit-EC2SubnetAttribute cmdlet.

```
Edit-EC2SubnetAttribute `
```

```
    -SubnetId subnet-0abcdef1234567890 `
    -PrivateDnsHostnameTypeOnLaunch ResourceName `
    -EnableResourceNameDnsAAAARecordOnLaunch $true `
    -EnableResourceNameDnsARecordOnLaunch $true
```

EC2 instances

Considerations

- To change the hostname type, you must first stop the instance. There is no need to stop an instance to change the other two options.
- Because you can't stop an instance with an instance store root volume, you can only configure the hostname type and DNS hostname options at instance launch. Only the following instance types support instance store root volumes: C1, C3, D2, I2, M1, M2, M3, R3, and X1.

Console

To modify the hostname type and DNS hostname options for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. If you're going to change the **Use resource based naming as guest OS hostname** setting, first stop the EC2 instance. Otherwise, skip this step.

   To stop the instance, select the instance and choose **Instance state**, **Stop instance**.
3. Select the instance and choose **Actions**, **Instance settings**, **Change resource based naming options**.

   - **Use resource based naming as guest OS hostname**: Determines whether you want the guest OS hostname of the EC2 instance to be the resource name or IP name.
   - **Answer DNS hostname IPv4 (A record) requests**: Determines whether DNS requests/queries to your resource name resolve to the private IPv4 address of this EC2 instance.
   - **Answer DNS hostname IPv6 (AAAA record) requests**: Determines whether DNS requests/queries to your resource name resolve to the IPv6 address (AAAA record) of this EC2 instance.
4. Choose **Save**.
5. If you stopped the instance, start it again.

AWS CLI

To modify the hostname type and DNS hostname options for an instance

Use the modify-private-dns-name-options command.

```
aws ec2 modify-private-dns-name-options \
    --instance-id i-1234567890abcdef0 \
    --private-dns-hostname-type resource-name \
    --enable-resource-name-dns-a-record \
    --enable-resource-name-dns-aaaa-record
```

PowerShell

To modify the hostname type and DNS hostname options for an instance

Use the Edit-EC2PrivateDnsNameOption cmdlet.

```
Edit-EC2PrivateDnsNameOption `
    -InstanceId i-1234567890abcdef0 `
    -PrivateDnsHostnameType ResourceName `
    -EnableResourceNameDnsAAAARecord $true`
    -EnableResourceNameDnsARecord $true
```

Bring your own IP addresses (BYOIP) to Amazon EC2

You can bring part or all of your publicly routable IPv4 or IPv6 address range from your on-premises network to your AWS account. You continue to control the address range and you can advertise the address range on the internet through AWS. After you bring the address range to Amazon EC2, it appears in your AWS account as an address pool.

Note

This documentation describes how to bring your own IP address range for use in Amazon EC2 only. To bring your own IP address range for use in AWS Global Accelerator, see Bring your own IP addresses (BYOIP) in the *AWS Global Accelerator Developer Guide*. To bring your own IP address range for use with Amazon VPC IP Address Manager, see Tutorial: Bring your IP addresses to IPAM in the *Amazon VPC IPAM User Guide*.

When you bring an IP address range to AWS, AWS validates that you control the IP address range. There are two methods that you can use to show that you control the range:

- If your IP address range is registered with an Internet Registry that supports RDAP (such as ARIN, RIPE and APNIC), you can verify control of your domain with an X.509 certificate by using the process on this page. The certificate must only be valid for the duration of the provisioning process. You can remove the certificate from your RIR's record after provisioning is complete.
- Regardless of whether your Internet Registry supports RDAP, you can use Amazon VPC IPAM to verify control of your domain with a DNS TXT record. That process is documented in Tutorial: Bring your IP addresses to IPAM in the *Amazon VPC IPAM User guide*.

Contents

- BYOIP definitions
- Requirements and quotas
- Prerequisites for BYOIP in Amazon EC2
- Onboard your address range for use in Amazon EC2
- Use your BYOIP address range in Amazon EC2

BYOIP definitions

- **X.509 Self-sign certificate** — A certificate standard most commonly used to encrypt and authenticate data within a network. It is a certificate used by AWS to validate control over IP space from an RDAP record. For more information about X.509 certificates, see RFC 3280.
- **Autonomous System Number (ASN)** – A globally unique identifier that defines a group of IP prefixes run by one or more network operators that maintain a single, clearly-defined routing policy.
- **Regional Internet Registry (RIR)** – An organization that manages allocation and registration of IP addresses and ASNs within a region of the world.
- **Registry Data Access Protocol (RDAP)** — A read-only protocol to query current registration data within a RIR. Entries within the queried RIR database are referred to as "RDAP records". Certain record types need to be updated by customers through a RIR-provided mechanism. These records are queried by AWS to verify control of an address space in the RIR.

- **Route Origin Authorization (ROA)** — An object created by RIRs for customers to authenticate IP advertisement in particular autonomous systems. For an overview, see Route Origin Authorizations (ROAs) on the ARIN website.
- **Local Internet Registry (LIR)** — Organizations such as internet service providers that allocate a block of IP addresses from an RIR for their customers.

Requirements and quotas

- The address range must be registered with your Regional Internet Registry (RIR). See your RIR for any policies regarding geographic regions. BYOIP currently supports registration in the American Registry for Internet Numbers (ARIN), Réseaux IP Européens Network Coordination Centre (RIPE), or Asia-Pacific Network Information Centre (APNIC). It must be registered to a business or institutional entity and cannot be registered to an individual person.
- The most specific IPv4 address range that you can bring is /24.
- The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /60 for CIDRs that are not publicly advertisable.
- ROAs are not required for CIDR ranges that are not publicly advertisable, but the RDAP records still need to be updated.
- You can bring each address range to one AWS Region at a time.
- You can bring a total of five BYOIP IPv4 and IPv6 address ranges per AWS Region to your AWS account. You cannot adjust the quotas for BYOIP CIDRs using the Service Quotas console, but you can request a quota increase by contacting the AWS Support Center as described in AWS service quotas in the *AWS General Reference*.
- You cannot share your IP address range with other accounts using AWS RAM unless you use Amazon VPC IP Address Manager (IPAM) and integrate IPAM with AWS Organizations. For more information, see Integrate IPAM with AWS Organizations in the *Amazon VPC IPAM User Guide*.
- The addresses in the IP address range must have a clean history. We might investigate the reputation of the IP address range and reserve the right to reject an IP address range if it contains an IP address that has a poor reputation or is associated with malicious behavior.
- Legacy address space, the IPv4 address space that was distributed by the Internet Assigned Numbers Authority's (IANA) central registry prior to the formation of the Regional Internet Registry (RIR) system, still requires a corresponding ROA object.
- For LIRs, it is common that they use a manual process to update their records. This can take days to deploy depending on the LIR.

- A single ROA object and RDAP record are needed for a large CIDR block. You can bring multiple smaller CIDR blocks from that range to AWS, even across multiple AWS Regions, using the single object and record.
- BYOIP is not supported for Wavelength Zones or on AWS Outposts.
- Do not make any manual changes for BYOIP in RADb or any other IRR. BYOIP will automatically update RADb. Any manual changes that include the BYOIP ASN will cause the BYOIP provision operation to fail.
- After you bring an IPv4 address range to AWS, you can use all of the IP addresses in the range, including the first address (the network address) and the last address (the broadcast address).

Prerequisites for BYOIP in Amazon EC2

The onboarding process for BYOIP has two phases, for which you must perform three steps. These steps correspond to the steps depicted in the following diagram. We include manual steps in this documentation, but your RIR might offer managed services to help you with these steps.

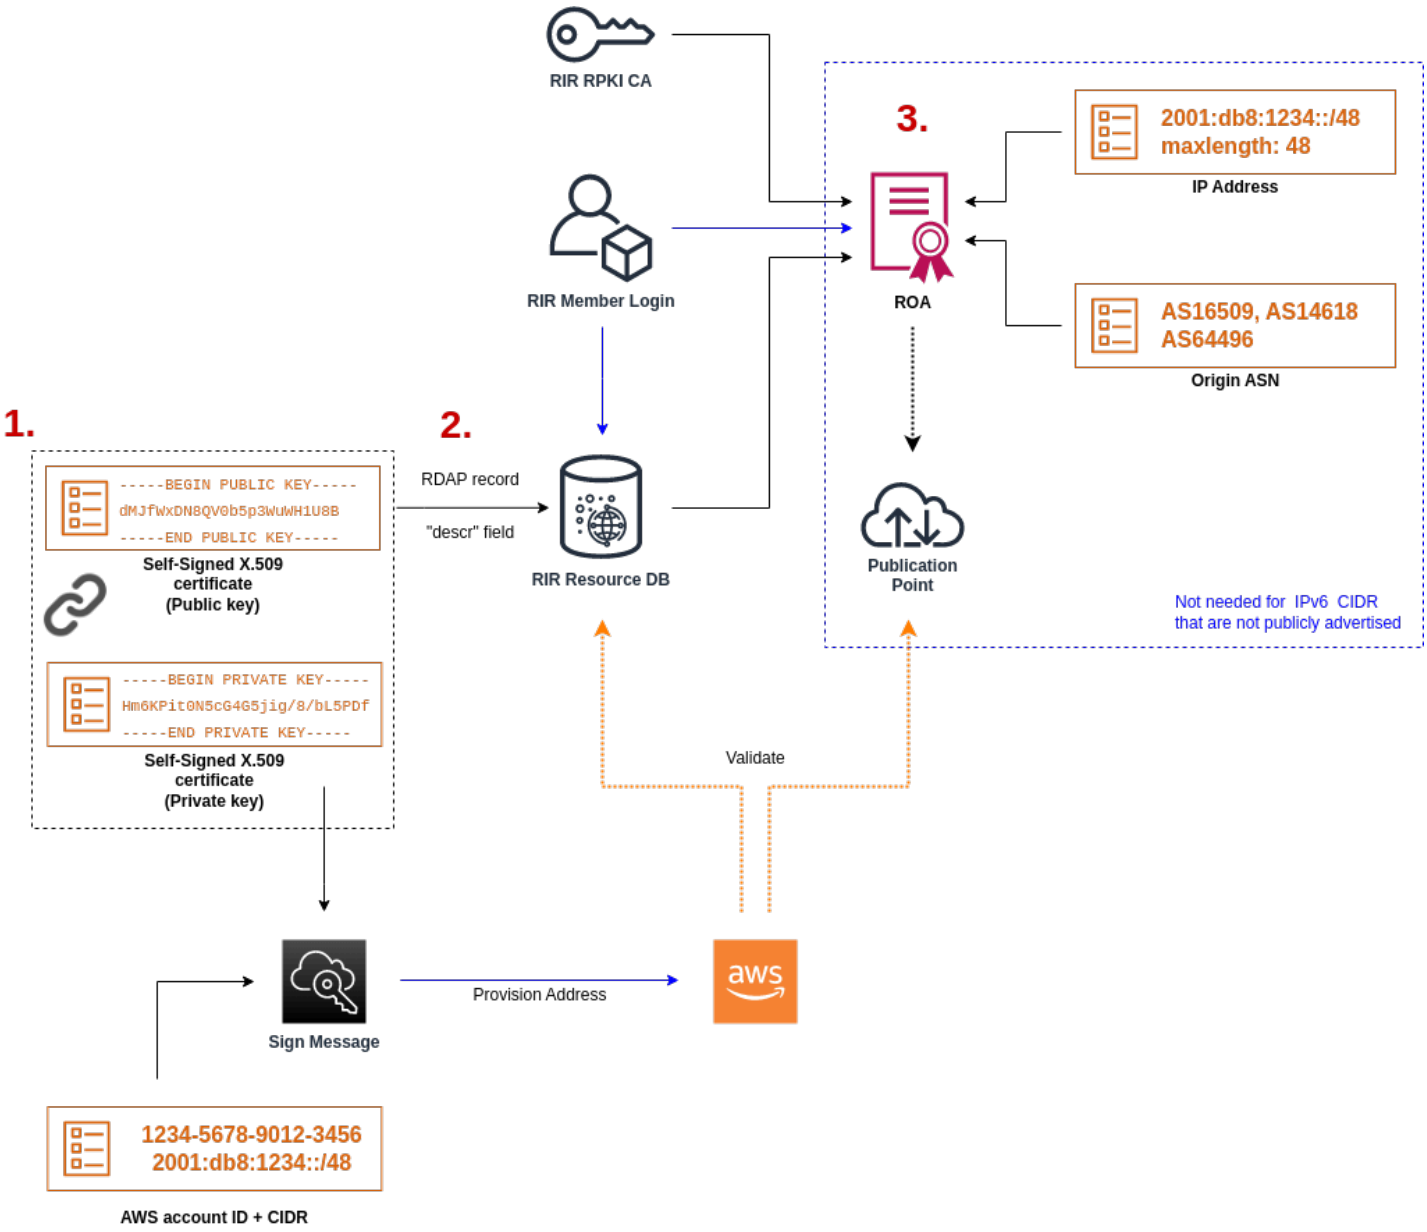
> **Tip**
>
> The tasks in this section require a Linux terminal and may be performed using Linux, the AWS CloudShell, or the Windows Subsystem for Linux.

Contents

- Overview
- Create a private key and generate an X.509 certificate
- Upload the X.509 certificate to the RDAP record in your RIR
- Create a ROA object in your RIR

Overview

Preparation phase



[1] Create a private key and use it to generate a self-signed X.509 certificate for authentication purposes. This certificate is only used during the provisioning phase. You can remove the certificate from your RIR's record after provisioning is complete

RIR configuration phase

[2] Upload the self-signed certificate to your RDAP record comments.

[3] Create a ROA object in your RIR. The ROA defines the desired address range, the Autonomous System Numbers (ASNs) allowed to advertise the address range, and an expiration date to register with the Resource Public Key Infrastructure (RPKI) of your RIR.

> **Note**
>
> A ROA is not required for non-publicly advertisable IPv6 address space.

To bring on multiple non-contiguous address ranges, you must repeat this process with each address range. However, the preparation and RIR configuration steps don't need to be repeated if splitting a contiguous block across several different AWS Regions.

Bringing on an address range has no effect on any address ranges that you brought on previously.

Create a private key and generate an X.509 certificate

Use the following procedure to create a self-signed X.509 certificate and add it to the RDAP record for your RIR. This key pair is used to authenticate the address range with the RIR. The **openssl** commands require OpenSSL version 1.0.2 or later.

Copy the following commands and replace only the placeholder values (in colored italic text).

This procedure follows the best practice of encrypting your private RSA key and requiring a passphrase to access it.

1. Generate an RSA 2048-bit private key as shown in the following.

```
$ openssl genpkey -aes256 -algorithm RSA -pkeyopt rsa_keygen_bits:2048 -out
 private-key.pem
```

The `-aes256` parameter specifies the algorithm used to encrypt the private key. The command returns the following output, including prompts to set a passphrase:

```
......+++
.+++
Enter PEM pass phrase: xxxxxxx
Verifying - Enter PEM pass phrase: xxxxxxx
```

You can inspect the key using the following command:

```
$ openssl pkey -in private-key.pem -text
```

This returns a passphrase prompt and the contents of the key, which should be similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxxx
-----BEGIN PRIVATE KEY-----

```

Keep your private key in a secure location when it is not in use.

2. Generate an X.509 certificate using the private key created in the previous step. In this example, the certificate expires in 365 days, after which time it cannot be trusted. Be sure to set the expiration appropriately. The certificate must only be valid for the duration of the provisioning process. You can remove the certificate from your RIR's record after provisioning is complete. The `tr -d "\n"` command strips newline characters (line breaks) from the output. You need to provide a Common Name when prompted, but the other fields can be left blank.

```
$ openssl req -new -x509 -key private-key.pem -days 365 | tr -d "\n" >
 certificate.pem
```

This results in output similar to the following:

```
Enter pass phrase for private-key.pem: xxxxxxx
You are about to be asked to enter information that will be incorporated
into your certificate request.
What you are about to enter is what is called a Distinguished Name or a DN.
There are quite a few fields but you can leave some blank
For some fields there will be a default value,
If you enter '.', the field will be left blank.
-----
Country Name (2 letter code) []:
State or Province Name (full name) []:
Locality Name (eg, city) []:
Organization Name (eg, company) []:
```

```
Organizational Unit Name (eg, section) []:
Common Name (eg, fully qualified host name) []:example.com
Email Address []:
```

> **Note**
>
> The Common Name is not needed for AWS provisioning. It can be any internal or public domain name.

You can inspect the certificate with the following command:

```
$ cat certificate.pem
```

The output should be a long, PEM-encoded string without line breaks, prefaced by `-----BEGIN CERTIFICATE-----` and followed by `-----END CERTIFICATE-----`.

Upload the X.509 certificate to the RDAP record in your RIR

Add the certificate that you previously created to the RDAP record for your RIR. Be sure to include the `-----BEGIN CERTIFICATE-----` and `-----END CERTIFICATE-----` strings before and after the encoded portion. All of this content must be on a single, long line. The procedure for updating RDAP depends on your RIR:

- For ARIN, use the Account Manager portal to add the certificate in the "Public Comments" section for the "Network Information" object representing your address range. Do not add it to the comments section for your organization.
- For RIPE, add the certificate as a new "descr" field to the "inetnum" or "inet6num" object representing your address range. These can usually be found in the "My Resources" section of the RIPE Database portal. Do not add it to the comments section for your organization or the "remarks" field of the above objects.
- For APNIC, add the certificate by editing remarks on the "inetnum" or "inet6num" record.

You can remove the certificate from your RIR's record after the provisioning stage below has been completed.

Create a ROA object in your RIR

Create a ROA object to authorize the Amazon ASNs 16509 and 14618 to advertise your address range, as well as the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Regions, authorize only ASN 8987. For the AWS European Sovereign Cloud, authorize ASNs 16509 and 214101. You must set the maximum length to the size of the CIDR that you are bringing in. The most specific IPv4 prefix you can bring is /24. The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /60 for CIDRs that are not publicly advertisable.

> **Important**
>
> If you are creating a ROA object for Amazon VPC IP Address Manager (IPAM), when you create the ROAs, for IPv4 CIDRs you must set the maximum length of an IP address prefix to /24. For IPv6 CIDRs, if you are adding them to an advertisable pool, the maximum length of an IP address prefix must be /48. This ensures that you have full flexibility to divide your public IP address across AWS Regions. IPAM enforces the maximum length you set. For more information about BYOIP addresses to IPAM, see Tutorial: BYOIP address CIDRs to IPAM in the *Amazon VPC IPAM User Guide*.

It might take up to 24 hours for the ROA to become available to Amazon. For more information, consult your RIR:

- ARIN — ROA Requests
- RIPE — Managing ROAs
- APNIC — Route Management

When you migrate advertisements from an on-premises workload to AWS, you must create a ROA for your existing ASN before creating the ROAs for Amazon's ASNs. Otherwise, you might see an impact to your existing routing and advertisements.

> **Important**
>
> For Amazon to advertise and continue advertising your IP address range, your ROAs with Amazon ASNs must be compliant with the above guidelines. If your ROAs are invalid or not

compliant with the above guidelines, Amazon reserves the right to stop advertising your IP address range.

Note

This step is not required for non-publicly advertisable IPv6 address space.

Onboard your address range for use in Amazon EC2

The onboarding process for BYOIP includes the following tasks, depending on your needs.

Tasks

- Provision a publicly advertisable address range in AWS
- Provision an IPv6 address range that's not publicly advertisable
- Advertise the address range through AWS
- Deprovision the address range
- Validate your BYOIP

Provision a publicly advertisable address range in AWS

When you provision an address range for use with AWS, you are confirming that you control the address range and are authorizing Amazon to advertise it. We also verify that you control the address range through a signed authorization message. This message is signed with the self-signed X.509 key pair that you used when updating the RDAP record with the X.509 certificate. AWS requires a cryptographically signed authorization message that it presents to the RIR. The RIR authenticates the signature against the certificate that you added to RDAP, and checks the authorization details against the ROA.

To provision the address range

1. **Compose message**

   Compose the plaintext authorization message. The format of the message is as follows, where the date is the expiry date of the message:

```
1|aws|account|cidr|YYYYMMDD|SHA256|RSAPSS
```

Replace the account number, address range, and expiry date with your own values to create a message resembling the following:

```
text_message="1|aws|0123456789AB|198.51.100.0/24|20211231|SHA256|RSAPSS"
```

This is not to be confused with a ROA message, which has a similar appearance.

2. **Sign message**

Sign the plaintext message using the private key that you created previously. The signature returned by this command is a long string that you need to use in the next step.

> **Important**
>
> We recommend that you copy and paste this command. Except for the message content, do not modify or replace any of the values.

```
signed_message=$( echo -n $text_message | openssl dgst -sha256 -sigopt
 rsa_padding_mode:pss -sigopt rsa_pss_saltlen:-1 -sign private-key.pem -keyform PEM
 | openssl base64 | tr -- '+=/' '-_~' | tr -d "\n")
```

3. **Provision address**

Use the AWS CLI provision-byoip-cidr command to provision the address range. The `--cidr-authorization-context` option uses the message and signature strings that you created previously.

> **Important**
>
> You must specify the AWS Region where the BYOIP range should be provisioned if it differs from your Configure the AWS CLI `Default region name`.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context
 Message="$text_message",Signature="$signed_message" --region us-east-1
```

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from `pending-provision` to `provisioned`.

4. **Monitor progress**

   While most provisioning will be completed within two hours, it might take up to one week to complete the provisioning process for publicly advertisable ranges. Use the describe-byoip-cidrs command to monitor progress, as in this example:

   ```
   aws ec2 describe-byoip-cidrs --max-results 5 --region us-east-1
   ```

   If there are issues during provisioning and the status goes to `failed-provision`, you must run the `provision-byoip-cidr` command again after the issues have been resolved.

Provision an IPv6 address range that's not publicly advertisable

By default, an address range is provisioned to be publicly advertisable to the internet. You can provision an IPv6 address range that will not be publicly advertisable. For routes that are not publicly advertisable, the provisioning process generally completes within minutes. When you associate an IPv6 CIDR block from a non-public address range with a VPC, the IPv6 CIDR can only be accessed through hybrid connectivity options that support IPv6, such as Direct Connect, AWS Site-to-Site VPN, or Amazon VPC Transit Gateways.

A ROA is not required to provision a non-public address range.

Important

- You can only specify whether an address range is publicly advertisable during provisioning. You cannot change the advertisable status later on.
- Amazon VPC doesn't support unique local address (ULA) CIDRs. All VPCs must have unique IPv6 CIDRs. Two VPCs can’t have the same IPv6 CIDR range.

To provision an IPv6 address range that will not be publicly advertisable, use the following provision-byoip-cidr command.

```
aws ec2 provision-byoip-cidr --cidr address-range --cidr-authorization-context
 Message="$text_message",Signature="$signed_message" --no-publicly-advertisable --
region us-east-1
```

Advertise the address range through AWS

After the address range is provisioned, it is ready to be advertised. You must advertise the exact address range that you provisioned. You can't advertise only a portion of the provisioned address range.

If you provisioned an IPv6 address range that will not be publicly advertised, you do not need to complete this step.

We recommend that you stop advertising the address range or any portion of the range from other locations before you advertise it through AWS. If you keep advertising your IP address range or any portion of it from other locations, we can't reliably support it or troubleshoot issues. Specifically, we can't guarantee that traffic to the address range or a portion of the range will enter our network.

To minimize down time, you can configure your AWS resources to use an address from your address pool before it is advertised, and then simultaneously stop advertising it from the current location and start advertising it through AWS. For more information about allocating an Elastic IP address from your address pool, see Allocate an Elastic IP address.

Limitations

- You can run the **advertise-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.
- You can run the **withdraw-byoip-cidr** command at most once every 10 seconds, even if you specify different address ranges each time.

To advertise the address range, use the following advertise-byoip-cidr command.

```
aws ec2 advertise-byoip-cidr --cidr address-range --region us-east-1
```

To stop advertising the address range, use the following withdraw-byoip-cidr command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

> **Note**
>
> In the `eu-central-1-ist-1` Local Zone, advertisement and withdrawal are asynchronous. The address range enters a `pending-advertising` or `pending-withdrawal` state before the operation completes. For more information, see Local Zone availability.

Deprovision the address range

To stop using your address range with AWS, first release any Elastic IP addresses and disassociate any IPv6 CIDR blocks that are still allocated from the address pool. Then stop advertising the address range, and finally, deprovision the address range.

You cannot deprovision a portion of the address range. If you want to use a more specific address range with AWS, deprovision the entire address range and provision a more specific address range.

(IPv4) To release each Elastic IP address, use the following release-address command.

```
aws ec2 release-address --allocation-id eipalloc-12345678abcabcabc --region us-east-1
```

(IPv6) To disassociate an IPv6 CIDR block, use the following disassociate-vpc-cidr-block command.

```
aws ec2 disassociate-vpc-cidr-block --association-id vpc-cidr-assoc-12345abcd1234abc1
 --region us-east-1
```

To stop advertising the address range, use the following withdraw-byoip-cidr command.

```
aws ec2 withdraw-byoip-cidr --cidr address-range --region us-east-1
```

To deprovision the address range, use the following deprovision-byoip-cidr command.

```
aws ec2 deprovision-byoip-cidr --cidr address-range --region us-east-1
```

It can take up to a day to deprovision an address range.

Validate your BYOIP

1. Validate the self-signed x.509 key pair

   Validate that the certificate has been uploaded and is valid through the whois command.

   For ARIN, use `whois -h whois.arin.net r + 2001:0DB8:6172::/48` to look up the RDAP record for your address range. Check the `Public Comments` section for the `NetRange` (network range) in the command output. The certificate should be added in the `Public Comments` section for the address range.

   You can inspect the `Public Comments` containing the certificate using the following command:

   ```
   whois -h whois.arin.net r + 2001:0DB8:6172::/48 | grep Comments | grep BEGIN
   ```

   This returns output with the contents of the key, which should be similar to the following:

   ```
   Public Comments:

-----END CERTIFICATE-----
```

2. Validate the creation of a ROA object

   Validate the successful creation of the ROA objects using the RIPEstat Data API. Be sure to test your address range against the Amazon ASNs 16509 and 14618, plus the ASNs that are currently authorized to advertise the address range. For the AWS GovCloud (US) Regions, test against ASN 8987. For the AWS European Sovereign Cloud, test against ASNs 16509 and 214101.

   You can inspect the ROA objects from different Amazon ASNs with your address range by using the following command:

```
curl --location --request GET "https://stat.ripe.net/data/rpki-validation/data.json?
resource=ASN&prefix=CIDR
```

In this example output, the response has a result of `"status": "valid"` for the Amazon ASN 16509. This indicates the ROA object for the address range was created successfully:

```
{
    "messages": [],
    "see_also": [],
    "version": "0.3",
    "data_call_name": "rpki-validation",
    "data_call_status": "supported",
    "cached": false,
    "data": {
        "validating_roas": [
            {
                "origin": "16509",
                "prefix": "2001:0DB8::/32",
                "max_length": 48,
                "validity": "valid"
            },
            {
                "origin": "14618",
                "prefix": "2001:0DB8::/32",
                "max_length": 48,
                "validity": "invalid_asn"
            },
            {
                "origin": "64496",
                "prefix": "2001:0DB8::/32",
                "max_length": 48,
                "validity": "invalid_asn"
            }
        ],
        "status": "valid",
        "validator": "routinator",
        "resource": "16509",
        "prefix": "2001:0DB8::/32"
    },
    "query_id": "20230224152430-81e6384e-21ba-4a86-852a-31850787105f",
    "process_time": 58,
    "server_id": "app116",
```

```
    "build_version": "live.2023.2.1.142",
    "status": "ok",
    "status_code": 200,
    "time": "2023-02-24T15:24:30.773654"
}
```

A status of “unknown” indicates the ROA object for the address range has not been created. A status of “invalid_asn” indicates that the ROA object for the address range was not created successfully.

Use your BYOIP address range in Amazon EC2

You can view and use the IPv4 and IPv6 address ranges that you've provisioned in your account. For more information, see the section called “Onboard your address range”.

IPv4 address ranges

You can create an Elastic IP address from your IPv4 address pool and use it with your AWS resources, such as EC2 instances, NAT gateways, and Network Load Balancers.

To view information about the IPv4 address pools that you've provisioned in your account, use the following describe-public-ipv4-pools command.

```
aws ec2 describe-public-ipv4-pools --region us-east-1
```

To create an Elastic IP address from your IPv4 address pool, use the allocate-address command. You can use the `--public-ipv4-pool` option to specify the ID of the address pool returned by `describe-byoip-cidrs`. Or you can use the `--address` option to specify an address from the address range that you provisioned.

IPv6 address ranges

To view information about the IPv6 address pools that you've provisioned in your account, use the following describe-ipv6-pools command.

```
aws ec2 describe-ipv6-pools --region us-east-1
```

To create a VPC and specify an IPv6 CIDR from your IPv6 address pool, use the following create-vpc command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 create-vpc --cidr-block 10.0.0.0/16 --ipv6-cidr-block ipv6-cidr --ipv6-
pool pool-id --region us-east-1
```

To associate an IPv6 CIDR block from your IPv6 address pool with a VPC, use the following associate-vpc-cidr-block command. To let Amazon choose the IPv6 CIDR from your IPv6 address pool, omit the `--ipv6-cidr-block` option.

```
aws ec2 associate-vpc-cidr-block --vpc-id vpc-123456789abc123ab --ipv6-cidr-block ipv6-
cidr --ipv6-pool pool-id --region us-east-1
```

To view your VPCs and the associated IPv6 address pool information, use the describe-vpcs command. To view information about associated IPv6 CIDR blocks from a specific IPv6 address pool, use the following get-associated-ipv6-pool-cidrs command.

```
aws ec2 get-associated-ipv6-pool-cidrs --pool-id pool-id --region us-east-1
```

If you disassociate the IPv6 CIDR block from your VPC, it's released back into your IPv6 address pool.

Elastic IP addresses

An *Elastic IP address* is a static IPv4 address designed for dynamic cloud computing. An Elastic IP address is allocated to your AWS account, and is yours until you release it. By using an Elastic IP address, you can mask the failure of an instance or software by rapidly remapping the address to another instance in your account. Alternatively, you can specify the Elastic IP address in a DNS record for your domain, so that your domain points to your instance. For more information, see the documentation for your domain registrar.

An Elastic IP address is a public IPv4 address, which is reachable from the internet. If you need to connect to an instance that does not have a public IPv4 address, you can associate an Elastic IP address with your instance to enable communication with the internet.

Contents

- Elastic IP address pricing
- Elastic IP address basics
- Elastic IP address quota
- Associate an Elastic IP address with an instance

- Transfer an Elastic IP address between AWS accounts
- Release an Elastic IP address
- Create a reverse DNS record for email on Amazon EC2

Elastic IP address pricing

There is a charge for all Elastic IP addresses whether they are in use (allocated to a resource, like an EC2 instance) or idle (created in your account but unallocated).

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the **Public IPv4 Address** tab on the Amazon VPC pricing page.

Elastic IP address basics

The following are the basic characteristics of an Elastic IP address:

- An Elastic IP address is static; it does not change over time.
- An Elastic IP address is for use in a specific Region only, and cannot be moved to a different Region.
- An Elastic IP address comes from Amazon's pool of IPv4 addresses, or from a custom IPv4 address pool that you have brought to your AWS account. We do not support Elastic IP addresses for IPv6.
- To use an Elastic IP address, you first allocate one to your account, and then associate it with your instance or a network interface.
- When you associate an Elastic IP address with an instance, it is also associated with the instance's primary network interface. When you associate an Elastic IP address with a network interface that is attached to an instance, it is also associated with the instance.
- When you associate an Elastic IP address with an instance or its primary network interface, if the instance already has a public IPv4 address associated with it, that public IPv4 address is released back into Amazon's pool of public IPv4 addresses and the Elastic IP address is associated with the instance instead. You cannot reuse the public IPv4 address previously associated with the instance and you cannot convert that public IPv4 address to an Elastic IP address. For more information, see Public IPv4 addresses.
- You can disassociate an Elastic IP address from a resource, and then associate it with a different resource. To avoid unexpected behavior, ensure that all active connections to the resource named

in the existing association are closed before you make the change. After you have associated your Elastic IP address to a different resource, you can reopen your connections to the newly associated resource.

- A disassociated Elastic IP address remains allocated to your account until you explicitly release it. You are charged for all Elastic IP addresses in your account, regardless of whether they are associated or disassociated with an instance. For more information, see the **Public IPv4 Address** tab on the Amazon VPC pricing page.
- When you associate an Elastic IP address with an instance that previously had a public IPv4 address, the public DNS host name of the instance changes to match the Elastic IP address.
- We resolve a public DNS host name to the public IPv4 address or the Elastic IP address of the instance outside the network of the instance, and to the private IPv4 address of the instance from within the network of the instance.
- When you allocate an Elastic IP address from an IP address pool that you have brought to your AWS account, it does not count toward your Elastic IP address limits. For more information, see Elastic IP address quota.
- When you allocate the Elastic IP addresses, you can associate the Elastic IP addresses with a network border group. This is the location from which we advertise the CIDR block. Setting the network border group limits the CIDR block to this group. If you do not specify the network border group, we set the border group containing all of the Availability Zones in the Region (for example, `us-west-2`).
- An Elastic IP address is for use in a specific network border group only.

Elastic IP address quota

By default, all AWS accounts have a quota of five (5) Elastic IP addresses per Region, because public (IPv4) internet addresses are a scarce public resource. We strongly recommend that you use Elastic IP addresses primarily for their ability to remap the address to another instance in the case of instance failure, and to use DNS hostnames for all other inter-node communication.

If you think your architecture warrants additional Elastic IP addresses, you can request a quota increase directly from the Service Quotas console. To request a quota increase, choose **Request increase at account-level**. For more information, see Amazon EC2 service quotas.

Associate an Elastic IP address with an instance

After you allocate an Elastic IP address, you can associate it with an AWS resource, such as an EC2 instance, NAT gateway, or Network Load Balancer. To associate an Elastic IP address with a different AWS resource later on, you can disassociate it from its current resource and then associated it with the new resource.

Tasks

- Allocate an Elastic IP address
- Associate an Elastic IP address
- Disassociate an Elastic IP address

Allocate an Elastic IP address

You can allocate an Elastic IP address for use in a Region. There is a charge for all Elastic IP addresses whether they are in use (associated with a resource, like an EC2 instance) or idle (created in your account but unassociated).

Console

To allocate an Elastic IP address

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network & Security**, **Elastic IPs**.
3. Choose **Allocate Elastic IP address**.
4. (Optional) When you allocate an Elastic IP address (EIP), you choose the **Network border group** in which to allocate the EIP. A network border group is a collection of Availability Zones (AZs), Local Zones, or Wavelength Zones from which AWS advertises a public IP address. Local Zones and Wavelength Zones may have different network border groups than the AZs in a Region to ensure minimum latency or physical distance between the AWS network and the customers accessing the resources in these Zones.

   Important

   You must allocate an EIP in the same network border group as the AWS resource that will be associated with the EIP. An EIP in one network border group can only

be advertised in zones in that network border group and not in any other zones represented by other network border groups.

If you have Local Zones or Wavelength Zones enabled (for more information, see Enable a Local Zone or Enable Wavelength Zones), you can choose a network border group for AZs, Local Zones, or Wavelength Zones. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group. You can use the EC2 console to view the network border group that your Availability Zones, Local Zones, or Wavelength Zones are in. Typically, all Availability Zones in a Region belong to the same network border group, whereas Local Zones or Wavelength Zones belong to their own separate network border groups.

If you don't have Local Zones or Wavelength Zones enabled, when you allocate an EIP, the network border group that represents all of the AZs for the Region (such as `us-west-2`) is predefined for you and you cannot change it. This means that the EIP that you allocate to this network border group will be advertised in all AZs in the Region you're in.

5. For **Public IPv4 address pool**, choose one of the following:

   - **Amazon's pool of IPv4 addresses**—If you want an IPv4 address to be allocated from Amazon's pool of IPv4 addresses.
   - **Public IPv4 address that you bring to your AWS account**—If you want to allocate a non-contiguous (non-sequential) public IPv4 address from an IP address pool that you have brought to your AWS account. This option is disabled if you do not have any IP address pools. For more information about bringing your own IP address range to your AWS account, see Bring your own IP addresses (BYOIP) to Amazon EC2.
   - **Customer owned pool of IPv4 addresses**—If you want to allocate an IPv4 address from a pool created from your on-premises network for use with an AWS Outpost. This option is disabled if you do not have an AWS Outpost.
   - **Allocate using an IPAM IPv4 pool**: If you want to allocate sequential Elastic IP addresses from a contiguous public IPv4 block in an IPAM pool. Allocating sequential Elastic IP addresses can significantly reduce management overhead for security access control lists and simplify IP address allocation and tracking for enterprises scaling on AWS. For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.

6. (Optional) To add a tag, choose **Add new tag** and enter a tag key and a tag value.

AWS CLI

To allocate an Elastic IP address

Use the allocate-address AWS CLI command.

In the following example, Amazon EC2 selects an address from Amazon's address pool.

```
aws ec2 allocate-address
```

In the following example, Amazon EC2 selects an address from the specified pool that you brought to AWS using BYOIP.

```
aws ec2 allocate-address \
    --public-ipv4-pool ipv4pool-ec2-012345abcdef67890
```

The following example specifies an address from the specified IPv4 IPAM pool.

```
aws ec2 allocate-address \
    --ipam-pool-id ipam-pool-1234567890abcdef0 \
    --address 192.0.2.0
```

PowerShell

To allocate an Elastic IP address

Use the New-EC2Address cmdlet.

In the following example, Amazon EC2 selects an address from Amazon's address pool.

```
New-EC2Address
```

In the following example, Amazon EC2 selects an address from the specified pool that you brought to AWS using BYOIP.

```
New-EC2Address `
    -PublicIpv4Pool ipv4pool-ec2-012345abcdef67890
```

The following example specifies an address from the specified IPv4 IPAM pool.

```
New-EC2Address `
    -IpamPoolId ipam-pool-1234567890abcdef0 `
    -Address 192.0.2.0
```

Associate an Elastic IP address

If you're associating an Elastic IP address with your instance to enable communication with the internet, you must also ensure that your instance is in a public subnet. For more information, see Enable internet access using an internet gateway in the *Amazon VPC User Guide*.

Console

To associate an Elastic IP address with an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions**, **Associate Elastic IP address**.
4. For **Resource type**, choose **Instance**.
5. For instance, choose the instance with which to associate the Elastic IP address. You can also enter text to search for a specific instance.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

To associate an Elastic IP address with a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to associate and choose **Actions**, **Associate Elastic IP address**.
4. For **Resource type**, choose **Network interface**.
5. For **Network interface**, choose the network interface with which to associate the Elastic IP address. You can also enter text to search for a specific network interface.
6. (Optional) For **Private IP address**, specify a private IP address with which to associate the Elastic IP address.
7. Choose **Associate**.

AWS CLI

To associate an Elastic IP address

Use the associate-address AWS CLI command.

```
aws ec2 associate-address \
    --instance-id i-0b263919b6498b123 \
    --allocation-id eipalloc-64d5890a
```

PowerShell

To associate an Elastic IP address

Use the Register-EC2Address cmdlet.

```
Register-EC2Address `
    -InstanceId i-0b263919b6498b123 `
    -AllocationId eipalloc-64d5890a
```

Disassociate an Elastic IP address

You can disassociate an Elastic IP address from an instance or network interface at any time. After you disassociate the Elastic IP address, you can associate it with another resource.

Console

To disassociate and reassociate an Elastic IP address

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to disassociate, choose **Actions**, **Disassociate Elastic IP address**.
4. Choose **Disassociate**.

AWS CLI

To disassociate an Elastic IP address

Use the disassociate-address AWS CLI command.

```
aws ec2 disassociate-address --association-id eipassoc-12345678
```

PowerShell

To disassociate an Elastic IP address

Use the Unregister-EC2Address cmdlet.

```
Unregister-EC2Address -AssociationId eipassoc-12345678
```

Transfer an Elastic IP address between AWS accounts

You can transfer an Elastic IP address from one AWS account to another. This can be helpful in the following situations:

- **Disaster recovery** – Quickly remap the IP addresses for public-facing internet workloads during emergency events.
- **Organizational restructuring** – Quickly move a workload from one AWS account to another. An address transfer avoids the need to wait for new Elastic IP addresses to be allowed by your security groups and network ACLs.
- **Centralized security administration** – Use a centralized AWS security account to track and transfer Elastic IP addresses that have been vetted for security compliance.

Pricing

There is no charge for transferring Elastic IP addresses.

Tasks

- Enable Elastic IP address transfer
- Accept a transferred Elastic IP address
- Disable Elastic IP address transfer

Enable Elastic IP address transfer

This section describes how to accept a transferred Elastic IP address. Note the following limitations related to enabling Elastic IP addresses for transfer:

- You can transfer Elastic IP addresses from any AWS account (source account) to any other AWS account in the same AWS Region (transfer account). You cannot transfer Elastic IP addresses to a different Region.
- When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the describe-address-transfers command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.
- Accepted transfers are visible to the source account (for example in the AWS console or by using the describe-address-transfers command) for 14 days after the transfers have been accepted.
- AWS does not notify transfer accounts about pending Elastic IP address transfer requests. The owner of the source account must notify the owner of the transfer account that there is an Elastic IP address transfer request that they must accept.
- Any tags that are associated with an Elastic IP address being transferred are reset when the transfer is complete.
- You cannot transfer Elastic IP addresses allocated from public IPv4 address pools that you bring to your AWS account – commonly referred to as Bring Your Own IP (BYOIP) address pools.
- You cannot transfer Elastic IP addresses allocated from an Amazon-provided contiguous public IPv4 Amazon VPC IP Address Manager (IPAM) pool. Instead, IPAM allows you to share IPAM pools across AWS accounts by integrating IPAM with AWS Organizations and using AWS RAM. For more information, see Allocate sequential Elastic IP addresses from an IPAM pool in the *Amazon VPC IPAM User Guide*.
- If you attempt to transfer an Elastic IP address that has a reverse DNS record associated with it, you can begin the transfer process, but the transfer account will not be able to accept the transfer until the associated DNS record is removed.
- If you have enabled and configured AWS Outposts, you might have allocated Elastic IP addresses from a customer-owned IP address pool (CoIP). You cannot transfer Elastic IP addresses allocated from a CoIP. However, you can use AWS RAM to share a CoIP with another account. For more information, see Customer-owned IP addresses in the *AWS Outposts User Guide*.
- You can use Amazon VPC IPAM to track the transfer of Elastic IP addresses to accounts in an organization from AWS Organizations. For more information, see View IP address history. If an Elastic IP address is transferred to an AWS account outside of the organization, the IPAM audit history of the Elastic IP address is lost.

These steps must be completed by the source account.

Console

To enable Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
3. In the navigation pane, choose **Elastic IPs**.
4. Select one or more Elastic IP address to enable for transfer and choose **Actions**, **Enable transfer**.
5. If you are transferring multiple Elastic IP addresses, you'll see the **Transfer type** option. Choose one of the following options:
   - Choose **Single account** if you are transferring the Elastic IP addresses to a single AWS account.
   - Choose **Multiple accounts** if you are transferring the Elastic IP addresses to multiple AWS accounts.
6. Under **Transfer account ID**, enter the IDs of the AWS accounts that you want to transfer the Elastic IP addresses to.
7. Confirm the transfer by entering **`enable`** in the text box.
8. Choose **Submit**.
9. To accept the transfer, see Accept a transferred Elastic IP address. To disable the transfer, see Disable Elastic IP address transfer.

AWS CLI

To enable Elastic IP address transfer

Use the enable-address-transfer command.

```
aws ec2 enable-address-transfer \
    --allocation-id eipalloc-09ad461b0d03f6aaf \
    --transfer-account-id 123456789012
```

PowerShell

To enable Elastic IP address transfer

Use the Enable-EC2AddressTransfer cmdlet.

```
Enable-EC2AddressTransfer `
    -AllocationId eipalloc-09ad461b0d03f6aaf `
    -TransferAccountId 123456789012
```

Accept a transferred Elastic IP address

This section describes how to accept a transferred Elastic IP address.

When you transfer an Elastic IP address, there is a two-step handshake between the AWS accounts. When the source account starts the transfer, the transfer accounts have seven days to accept the Elastic IP address transfer. During those seven days, the source account can view the pending transfer (for example in the AWS console or by using the describe-address-transfers command). After seven days, the transfer expires and ownership of the Elastic IP address returns to the source account.

When accepting transfers, note the following exceptions that might occur and how to resolve them:

- **AddressLimitExceeded**: If your transfer account has exceeded the Elastic IP address quota, the source account can enable Elastic IP address transfer, but this exception occurs when the transfer account tries to accept the transfer. By default, all AWS accounts are limited to 5 Elastic IP addresses per Region. See Elastic IP address quota for instructions on increasing the limit.
- **InvalidTransfer.AddressCustomPtrSet**: If you or someone in your organization has configured the Elastic IP address that you are attempting to transfer to use reverse DNS lookup, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must remove the DNS record for the Elastic IP address. For more information, see Create a reverse DNS record for email on Amazon EC2.
- **InvalidTransfer.AddressAssociated**: If an Elastic IP address is associated with an ENI or EC2 instance, the source account can enable transfer for the Elastic IP address, but this exception occurs when the transfer account tries to accept the transfer. To resolve this issue, the source account must disassociate the Elastic IP address. For more information, see Disassociate an Elastic IP address.

For any other exceptions, contact Support.

These steps must be completed by the transfer account.

Console

To accept an Elastic IP address transfer

1. Ensure that you're using the transfer account.
2. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
3. In the navigation pane, choose **Elastic IPs**.
4. Choose **Actions**, **Accept transfer**.
5. No tags that are associated with the Elastic IP address being transferred are transferred with the Elastic IP address when you accept the transfer. If you want to define a **Name** tag for the Elastic IP address that you are accepting, select **Create a tag with a key of 'Name' and a value that you specify**.
6. Enter the Elastic IP address that you want to transfer.
7. If you are accepting multiple transferred Elastic IP addresses, choose **Add address** to enter an additional Elastic IP address.
8. Choose **Submit**.

AWS CLI

To accept an Elastic IP address transfer

Use the accept-address-transfer command.

```
aws ec2 accept-address-transfer --address 100.21.184.216
```

PowerShell

To accept an Elastic IP address transfer

Use the Approve-EC2AddressTransfer cmdlet.

```
Approve-EC2AddressTransfer -Address 100.21.184.216
```

Disable Elastic IP address transfer

This section describes how to disable an Elastic IP transfer after the transfer has been enabled.

These steps must be completed by the source account that enabled the transfer.

Console

To disable an Elastic IP address transfer

1. Ensure that you're using the source AWS account.
2. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
3. In the navigation pane, choose **Elastic IPs**.
4. In the resource list of Elastic IPs, ensure that you have the property enabled that shows the column **Transfer status**.
5. Select one or more Elastic IP address that have a **Transfer status** of **Pending**, and choose **Actions**, **Disable transfer**.
6. Confirm by entering **`disable`** in the text box.
7. Choose **Submit**.

AWS CLI

To disable Elastic IP address transfer

Use the disable-address-transfer command.

```
aws ec2 disable-address-transfer --allocation-id eipalloc-09ad461b0d03f6aaf
```

PowerShell

To disable Elastic IP address transfer

Use the Disable-EC2AddressTransfer cmdlet.

```
Disable-EC2AddressTransfer -AllocationId eipalloc-09ad461b0d03f6aaf
```

Release an Elastic IP address

If you no longer need an Elastic IP address, we recommend that you release it. The Elastic IP address to release must not be currently associated with an AWS resource.

Console

To release an Elastic IP address

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address to release and choose **Actions**, **Release Elastic IP addresses**.
4. Choose **Release**.

AWS CLI

To release an Elastic IP address

Use the release-address AWS CLI command.

```
aws ec2 release-address --allocation-id eipalloc-64d5890a
```

PowerShell

To release an Elastic IP address

Use the Remove-EC2Address cmdlet.

```
Remove-EC2Address -AllocationId eipalloc-64d5890a
```

After you release your Elastic IP address, you might be able to recover. The following rules apply:

- You can't recover an Elastic IP address if it has been allocated to another AWS account, or if it will result in your exceeding your Elastic IP address limit.
- You can't recover tags associated with an Elastic IP address.

AWS CLI

To recover an Elastic IP address

Use the allocate-address command.

```
aws ec2 allocate-address \
```

```
    --domain vpc \
    --address 203.0.113.3
```

PowerShell

To recover an Elastic IP address

Use the New-EC2Address cmdlet.

```
New-EC2Address `
    -Address 203.0.113.3 `
    -Domain vpc `
    -Region us-east-1
```

Create a reverse DNS record for email on Amazon EC2

If you intend to send email to third parties from an EC2 instance, we recommend that you provision one or more Elastic IP addresses and assign static reverse DNS records to the Elastic IP addresses that you use to send email. This can help you avoid having your email flagged as spam by some anti-spam organizations. AWS works with ISPs and internet anti-spam organizations to reduce the chance that your email sent from these addresses will be flagged as spam.

Considerations

- Before you create a reverse DNS record, you must set a corresponding forward DNS record (record type A) that resolves to an Elastic IP address in your account. As a best practice, include all Elastic IP addresses for which you intend to create reverse DNS records in the forward DNS record.
- If a reverse DNS record is associated with an Elastic IP address, the Elastic IP address is locked to your account and cannot be released from your account until the record is removed.
- If you contacted Support to set up reverse DNS for an Elastic IP address, you can remove the reverse DNS, but you can't release the Elastic IP address because it is locked by Support. To unlock the Elastic IP address, contact AWS Support. After the Elastic IP address is unlocked, you can release it.
- [AWS GovCloud (US) Region] You can't create a reverse DNS record. AWS must assign the static reverse DNS records for you. Open a support case to remove reverse DNS and email sending limitations. You must provide your Elastic IP addresses and reverse DNS records.

Create a reverse DNS record

You can create a reverse DNS record for your Elastic IP address as follows.

Console

To create a reverse DNS record

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.
3. Select the Elastic IP address and choose **Actions**, **Update reverse DNS**.
4. For **Reverse DNS domain name**, enter the domain name.
5. Enter **`update`** to confirm.
6. Choose **Update**.

AWS CLI

To create a reverse DNS record

Use the modify-address-attribute command.

```
aws ec2 modify-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --domain-name example.com
```

The following is example output.

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.net.",
            "PtrRecordUpdate": {
                "Value": "example.com.",
                "Status": "PENDING"
            }
        }
    ]
```

```
}
```

PowerShell

To create a reverse DNS record

Use the Edit-EC2AddressAttribute cmdlet.

```
Edit-EC2AddressAttribute `
    -AllocationId 'eipalloc-abcdef01234567890' `
    -DomainName 'example.com' |
Format-List `
    AllocationId, PtrRecord, PublicIp,
    @{Name='PtrRecordUpdate';Expression={$_.PtrRecordUpdate | Format-List | Out-
String}}
```

The following is example output.

```
AllocationId    : eipalloc-abcdef01234567890
PtrRecord       : example.net.
PublicIp        : 192.0.2.0
PtrRecordUpdate :
                  Reason :
                  Status : PENDING
                  Value  : example.com.
```

Remove a reverse DNS record

You can remove a reverse DNS record from your Elastic IP address as follows.

If you receive the following error, you can submit a Request to remove email sending restrictions to Support for assistance.

```
The address cannot be released because it is locked to your account.
```

Console

To remove a reverse DNS record

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Elastic IPs**.

3. Select the Elastic IP address and choose **Actions**, **Update reverse DNS**.
4. For **Reverse DNS domain name**, clear the domain name.
5. Enter **update** to confirm.
6. Choose **Update**.

AWS CLI

To remove a reverse DNS record

Use the reset-address-attribute command.

```
aws ec2 reset-address-attribute \
    --allocation-id eipalloc-abcdef01234567890 \
    --attribute domain-name
```

The following is example output.

```
{
    "Addresses": [
        {
            "PublicIp": "192.0.2.0",
            "AllocationId": "eipalloc-abcdef01234567890",
            "PtrRecord": "example.com.",
            "PtrRecordUpdate": {
                "Value": "example.net.",
                "Status": "PENDING"
            }
        }
    ]
}
```

PowerShell

To remove a reverse DNS record

Use the Reset-EC2AddressAttribute cmdlet.

```
Reset-EC2AddressAttribute `
    -AllocationId 'eipalloc-abcdef01234567890' `
    -Attribute domain-name |
```

```
Format-List `
    AllocationId, PtrRecord, PublicIp,
    @{Name='PtrRecordUpdate';Expression={$_.PtrRecordUpdate | Format-List | Out-
String}}
```

The following is example output.

```
AllocationId    : eipalloc-abcdef01234567890
PtrRecord       : example.com.
PublicIp        : 192.0.2.0
PtrRecordUpdate :
                  Reason :
                  Status : PENDING
                  Value  : example.net.
```

Elastic network interfaces

An *elastic network interface* is a logical networking component in a VPC that represents a virtual network card. You can create and configure network interfaces and attach them to instances that you launch in the same Availability Zone. The attributes of a network interface follow it as it's attached or detached from an instance and reattached to another instance. When you move a network interface from one instance to another, network traffic is redirected from the original instance to the new instance.

Note that this AWS resource is referred to as a *network interface* in the AWS Management Console and the Amazon EC2 API. Therefore, we use "network interface" in this documentation instead of "elastic network interface". The term "network interface" in this documentation always means "elastic network interface".

Network interface attributes

A network interface can include the following attributes:

- A primary private IPv4 address from the IPv4 address range of your subnet
- A primary IPv6 address from the IPv6 address range of your subnet
- Secondary private IPv4 addresses from the IPv4 address range of your subnet
- One Elastic IP address (IPv4) for each private IPv4 address
- One public IPv4 address

- Secondary IPv6 addresses
- Security groups
- A MAC address
- A source/destination check flag
- A description

Monitoring traffic

You can enable a VPC flow log on your network interface to capture information about the traffic going to and from a network interface. After you've created a flow log, you can view and retrieve its data in Amazon CloudWatch Logs. For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

Network interface concepts

The following are important concepts to understand as you get started using network interfaces.

Primary network interface

Each instance has a default network interface, called the *primary network interface*. You can't detach a primary network interface from an instance.

Secondary network interfaces

You can create and attach secondary network interfaces to your instance. The maximum number of network interfaces varies by instance type. For more information, see Maximum IP addresses per network interface.

IPv4 addresses for network interfaces

When you launch an EC2 instance into an IPv4-only or dual stack subnet, the instance receives a primary private IP address from the IPv4 address range of the subnet. You can also specify additional private IPv4 addresses, known as secondary private IPv4 addresses. Unlike primary private IP addresses, secondary private IP addresses can be reassigned from one instance to another.

Public IPv4 addresses for network interfaces

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are assigned a public IPv4 address. For more information, see Subnet settings in the *Amazon VPC User Guide*. When you launch an instance, the IP address is assigned to the primary network interface. If you specify an existing network interface as the primary network interface when you launch an instance, the public IPv4 address is determined by this network interface.

When you create a network interface, it inherits the public IPv4 addressing attribute from the subnet. If you later modify the public IPv4 addressing attribute of the subnet, the network interface keeps the setting that was in effect when it was created.

We release the public IP address when the instance is stopped, hibernated, or terminated. We assign a new public IP address when you start your stopped or hibernated instance, unless it has a secondary network interface or a secondary private IPv4 address that is associated with an Elastic IP address.

IPv6 addresses for network interfaces

If you associate IPv6 CIDR blocks with your VPC and subnet, you can assign IPv6 addresses from the subnet range to a network interface. Each IPv6 address can be assigned to one network interface.

All subnets have a modifiable attribute that determines whether network interfaces created in that subnet (and therefore instances launched into that subnet) are automatically assigned an IPv6 address from the range of the subnet. When you launch an instance, the IPv6 address is assigned to the primary network interface.

Elastic IP addresses for network interfaces

You can associate an Elastic IP address with one of the private IPv4 addresses for the network interface. You can associate one Elastic IP address with each private IPv4 address. If you disassociate an Elastic IP address from a network interface, you can release it or associate it with a different instance.

Termination behavior

You can set the termination behavior for a network interface that's attached to an instance. You can specify whether the network interface should be automatically deleted when you terminate the instance to which it's attached.

Source/destination checking

You can enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. Source/destination checks are enabled by default. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Requester-managed network interfaces

These network interfaces are created and managed by AWS services to enable you to use some resources and services. You can't manage these network interfaces yourself. For more information, see Requester-managed network interfaces.

Prefix delegation

A prefix is a reserved private IPv4 or IPv6 CIDR range that you allocate for automatic or manual assignment to network interfaces that are associated with an instance. By using Delegated Prefixes, you can launch services faster by assigning a range of IP addresses as a single prefix.

Managed network interfaces

A *managed network interface* is managed by a service provider, such as Amazon EKS Auto Mode. You can't directly modify the settings of a managed network interface. Managed network interface are identified by a **true** value in the **Managed** field. For more information, see Amazon EC2 managed instances.

Network cards

Most instance types support one network card. Instance types that support multiple network cards provide higher network performance, including bandwidth capabilities above 100 Gbps

and improved packet rate performance. When you attach a network interface to an instance that supports multiple network cards, you can select the network card for the network interface. The primary network interface must be assigned to network card index 0.

EFA and EFA-only network interfaces count as a network interface. You can assign only one EFA or EFA-only network interface per network card. The primary network interface can't be an EFA-only network interface.

The following instance types support multiple network cards. For information about the number of network interfaces that an instance type supports, see Maximum IP addresses per network interface.

Instance type	Number of network cards
c6in.32xlarge	2
c6in.metal	2
c8gb.48xlarge	2
c8gb.metal-48xl	2
c8gn.48xlarge	2
c8gn.metal-48xl	2

u7in-32tb.224xlarge	2
u7inh-32tb.480xlarge	2

Maximum IP addresses per network interface

Each instance type supports a maximum number of network interfaces, maximum number of private IPv4 addresses per network interface, and maximum number of IPv6 addresses per network interface. The limit for IPv6 addresses is separate from the limit for private IPv4 addresses per network interface. Note that all instance types support IPv6 addressing except for the following: C1, M1, M2, M3, and T1.

Available network interfaces

The *Amazon EC2 Instance Types Guide* provides the information about the network interfaces available for each instance type. For more information, see the following:

- Network specifications – General purpose
- Network specifications – Compute optimized
- Network specifications – Memory optimized
- Network specifications – Storage optimized
- Network specifications – Accelerated computing
- Network specifications – High-performance computing
- Network specifications – Previous generation

Console

To retrieve the maximum network interfaces

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instance Types**.
3. Add a filter to specify the instance type (**Instance type=c5.12xlarge**) or instance family (**Instance family=c5**).
4. (Optional) Choose the **Preferences** icon and then turn on **Maximum number of network interfaces**. This column indicates the maximum number of network interfaces for each instance type.
5. (Optional) Select the instance type. On the **Networking** tab, find **Maximum number of network interfaces**.

AWS CLI

To retrieve the maximum network interfaces

You can use the describe-instance-types command to display information about an instance type, such as its supported network interfaces and IP addresses per interface. The following example displays this information for all C8i instances.

```
{ echo -e "InstanceType\tMaximumNetworkInterfaces\tIpv4AddressesPerInterface"; \
aws ec2 describe-instance-types \
    --filters "Name=instance-type,Values=c8i.*" \
    --query 'InstanceTypes[*].[InstanceType, NetworkInfo.MaximumNetworkInterfaces,
 NetworkInfo.Ipv4AddressesPerInterface]' \
    --output text | sort -k2 -n; } | column -t
```

The following is example output.

```
InstanceType    MaximumNetworkInterfaces  Ipv4AddressesPerInterface
c8i.large       3                         20
c8i.2xlarge     4                         30
c8i.xlarge      4                         30
c8i.4xlarge     8                         50
c8i.8xlarge     10                        50
c8i.12xlarge    12                        50
c8i.16xlarge    16                        64
c8i.24xlarge    16                        64
c8i.32xlarge    24                        64
c8i.48xlarge    24                        64
c8i.96xlarge    24                        64
c8i.metal-48xl  24                        64
c8i.metal-96xl  24                        64
```

PowerShell

To retrieve the maximum network interfaces

You can use the Get-EC2InstanceType PowerShell command to display information about an instance type, such as its supported network interfaces and IP addresses per interface. The following example displays this information for all C8i instances.

```
Get-EC2InstanceType -Filter @{Name="instance-type"; Values="c8i.*"} |
Select-Object `
```

```
    InstanceType,
    @{Name='MaximumNetworkInterfaces';
 Expression={$_.NetworkInfo.MaximumNetworkInterfaces}},
    @{Name='Ipv4AddressesPerInterface';
 Expression={$_.NetworkInfo.Ipv4AddressesPerInterface}} |
Sort-Object MaximumNetworkInterfaces |
Format-Table -AutoSize
```

The following is example output.

```
InstanceType   MaximumNetworkInterfaces Ipv4AddressesPerInterface
------------   ------------------------ -------------------------
c8i.large                             3                        20
c8i.xlarge                            4                        30
c8i.2xlarge                           4                        30
c8i.4xlarge                           8                        50
c8i.8xlarge                          10                        50
c8i.12xlarge                         12                        50
c8i.24xlarge                         16                        64
c8i.16xlarge                         16                        64
c8i.96xlarge                         24                        64
c8i.48xlarge                         24                        64
c8i.metal-96xl                       24                        64
c8i.32xlarge                         24                        64
c8i.metal-48xl                       24                        64
```

Create a network interface for your EC2 instance

You can create a network interface for use by your EC2 instances. When you create a network interface, you specify the subnet for which it is created. You can't move a network interface to another subnet after it's created. You must attach a network interface to an instance in the same Availability Zone. You can detach a secondary network interface from an instance and then attach it to a different instance in the same Availability Zone. You can't detach a primary network interface from an instance. For more information, see the section called “Network interface attachments”.

Console

To create a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create network interface**.
4. (Optional) For **Description**, enter a descriptive name.
5. For **Subnet**, select a subnet. The options available in the subsequent steps change depending on the type of subnet you select (IPv4-only, IPv6-only, or dual-stack (IPv4 and IPv6)).
6. For **Interface type**, choose one of the following:

   - **ENA**: A high-performance network interface designed to handle high throughput and packet-per-second rates for TCP/IP protocols while minimizing CPU usage. This is the default value. For more information about ENA, see Elastic Network Adapter.
   - **EFA with ENA**: A network interface that supports both ENA and EFA devices for traditional TCP/IP based transport along with SRD based transport. If you choose EFA with ENA, the instance you are attaching it to must support EFA. For more information about EFA, see Elastic Fabric Adapter.
   - **EFA-only**: A high-performance network interface designed to handle high throughput, low latency inter-node communication for SRD based transport while bypassing the operating system stack. If you choose this option, the instance you are attaching it to must support EFA. EFA-only network interfaces do not support IP addresses. For more information about EFA, see Elastic Fabric Adapter.
7. For **Private IPv4 address**, do one of the following:
   - Choose **Auto-assign** to allow Amazon EC2 to select an IPv4 address from the subnet.
   - Choose **Custom** and enter an IPv4 address that you select from the subnet.
8. (Subnets with IPv6 addresses only) For **IPv6 address**, do one of the following:
   - Choose **None** if you do not want to assign an IPv6 address to the network interface.
   - Choose **Auto-assign** to allow Amazon EC2 to select an IPv6 address from the subnet.
   - Choose **Custom** and enter an IPv6 address that you select from the subnet.
9. (Optional) If you're creating a network interface in a dual-stack or IPv6-only subnet, you have the option to **Assign Primary IPv6 IP**. This assigns a primary IPv6 global unicast address (GUA) to the network interface. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. Choose **Enable** if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. After you enable an IPv6 GUA address to be a primary IPv6, you can't disable it.

When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.

10. (Optional) To create an Elastic Fabric Adapter, choose **Elastic Fabric Adapter**, **Enable**.
11. (Optional) Under **Advanced settings**, you can optionally set IP prefix delegation. For more information, see Prefix delegation.

    - **Auto-assign** — AWS chooses the prefix from the IPv4 or IPv6 CIDR blocks for the subnet, and assigns it to the network interface.
    - **Custom** — You specify the prefix from the IPv4 or IPv6 CIDR blocks for the subnet, and AWS verifies that the prefix is not already assigned to other resources before assigning it to the network interface.
12. (Optional) Under **Advanced settings**, for **Idle connection tracking timeout**, modify the default idle connection timeouts. For more information, see Idle connection tracking timeout.

    - **TCP established timeout**: Timeout (in seconds) for idle TCP connections in an established state.
      - Min: 60 seconds
      - Max: 432000 seconds
      - Default: 350 seconds for Nitro v6 instance types (excluding P6e-GB200); 432000 seconds for all other instance types (including P6e-GB200).
      - Recommended: Less than 432000 seconds
    - **UDP timeout**: Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction.
      - Min: 30 seconds
      - Max: 60 seconds
      - Default: 30 seconds
    - **UDP stream timeout**: Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction.
      - Min: 60 seconds
      - Max: 180 seconds

- Default: 180 seconds

13. For **Security groups**, select one or more security groups.
14. (Optional) For each tag, choose **Add new tag** and enter a tag key and an optional tag value.
15. Choose **Create network interface**.

AWS CLI

Example 1: To create a network interface with IP addresses chosen by Amazon EC2

Use the following create-network-interface command. This example creates a network interface with a public IPv4 address and an IPv6 address chosen by Amazon EC2.

```
aws ec2 create-network-interface \
    --subnet-id subnet-0abcdef1234567890 \
    --description "my dual-stack network interface" \
    --ipv6-address-count 1 \
    --groups sg-1234567890abcdef0
```

Example 2: To create a network interface with specific IP addresses

Use the following create-network-interface command.

```
aws ec2 create-network-interface \
    --subnet-id subnet-0abcdef1234567890 \
    --description "my dual-stack network interface" \
    --private-ip-address 10.251.50.12 \
    --ipv6-addresses 2001:db8::1234:5678:1.2.3.4 \
    --groups sg-1234567890abcdef0
```

Example 3: To create a network interface with a count of secondary IP addresses

Use the following create-network-interface command. In this example, Amazon EC2 chooses both the primary IP address and the secondary IP addresses.

```
aws ec2 create-network-interface \
    --subnet-id subnet-0abcdef1234567890 \
    --description "my network interface" \
    --secondary-private-ip-address-count 2 \
```

```
    --groups sg-1234567890abcdef0
```

Example 4: To create a network interface with a specific secondary IP address

Use the following create-network-interface command. This example specifies a primary IP address and a secondary IP address.

```
aws ec2 create-network-interface \
    --subnet-id subnet-0abcdef1234567890 \
    --description "my network interface" \
    --private-ip-addresses PrivateIpAddress=10.0.1.30,Primary=true \
                           PrivateIpAddress=10.0.1.31,Primary=false
    --groups sg-1234567890abcdef0
```

PowerShell

Example 1: To create a network interface with IP addresses chosen by Amazon EC2

Use the New-EC2NetworkInterface cmdlet. This example creates a network interface with a public IPv4 address and an IPv6 address chosen by Amazon EC2.

```
New-EC2NetworkInterface `
    -SubnetId subnet-0abcdef1234567890 `
    -Description "my dual-stack network interface" `
    -Ipv6AddresCount 1 `
    -Group sg-1234567890abcdef0
```

Example 2: To create a network interface with specific IP addresses

Use the New-EC2NetworkInterface cmdlet.

```
New-EC2NetworkInterface `
    -SubnetId subnet-0abcdef1234567890 `
    -Description "my dual-stack network interface" `
    -PrivateIpAddress 10.251.50.12 `
    -Ipv6Address $ipv6addr `
    -Group sg-1234567890abcdef0
```

Define the IPv6 addresses as follows.

```
$ipv6addr = New-Object Amazon.EC2.Model.InstanceIpv6Address
```

```
$ipv6addr1.Ipv6Address = "2001:db8::1234:5678:1.2.3.4"
```

Example 3: To create a network interface with a count of secondary IP addresses

Use the New-EC2NetworkInterface cmdlet. In this example, Amazon EC2 chooses both the primary IP address and the secondary IP addresses.

```
New-EC2NetworkInterface `
    -SubnetId subnet-0abcdef1234567890 `
    -Description "my network interface" `
    -SecondaryPrivateIpAddressCount 2 `
    -Group sg-1234567890abcdef0
```

Example 4: To create a network interface with a specific secondary IP address

Use the New-EC2NetworkInterface cmdlet. This example specifies a primary IP address and a secondary IP address.

```
New-EC2NetworkInterface `
    -SubnetId subnet-0abcdef1234567890 `
    -Description "my network interface" `
    -PrivateIpAddresses @($primary, $secondary) `
    -Group sg-1234567890abcdef0
```

Define the secondary addresses as follows.

```
$primary = New-Object Amazon.EC2.Model.PrivateIpAddressSpecification
$primary.PrivateIpAddress = "10.0.1.30"
$primary.Primary = $true
$secondary = New-Object Amazon.EC2.Model.PrivateIpAddressSpecification
$secondary.PrivateIpAddress = "10.0.1.31"
$secondary.Primary = $false
```

Network interface attachments for your EC2 instance

You can create network interfaces to be used by your EC2 instances as primary or secondary network interfaces. You must attach a network interface to an EC2 instance if it is in the same Availability Zone as the network interface. The instance type of an instance determines how many network interfaces you can attach to the instance. For more information, see the section called “IP addresses per network interface”.

Considerations

- You can attach a network interface to an instance when it's running (hot attach), when it's stopped (warm attach), or when the instance is being launched (cold attach).
- You can detach secondary network interfaces when the instance is running or stopped. However, you can't detach the primary network interface.
- You can detach a secondary network interface from one instance and attach it to another instance.
- When launching an instance using the CLI, API, or an SDK, you can specify the primary network interface and additional network interfaces. Note that you can't enable the auto-assignment of public IPv4 addresses if you add a secondary network interface during launch.
- Launching an Amazon Linux or Windows Server instance with multiple network interfaces automatically configures interfaces, private IPv4 addresses, and route tables on the operating system of the instance.
- A warm or hot attach of an additional network interface might require you to manually bring up the second interface, configure the private IPv4 address, and modify the route table accordingly. Instances running Amazon Linux or Windows Server automatically recognize the warm or hot attach and configure themselves.
- You can't attach another network interface to an instance (for example, a NIC teaming configuration) to increase or double the network bandwidth to or from the dual-homed instance.
- If you attach multiple network interfaces from the same subnet to an instance, you might encounter networking issues such as asymmetric routing. If possible, add a secondary private IPv4 address on the primary network interface instead.
- For EC2 instances in an IPv6-only subnet, if you attach a secondary network interface, the private DNS hostname of the secondary network interface resolves to the primary IPv6 address for the primary network interface.
- [Windows instances] – If you add multiple network interfaces to an instance, you must configure the network interfaces to use static routing.

Attach a network interface

You can attach a network interface to any instance in the same Availability Zone as the network interface, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console. Alternatively, you can specify existing network interfaces when you launch instances.

If the public IPv4 address on your instance is released, it does not receive a new one if there is more than one network interface attached to the instance. For more information about the behavior of public IPv4 addresses, see Public IPv4 addresses.

Console

To attach a network interface using the Instances page

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance.
4. Choose **Actions**, **Networking**, **Attach network interface**.
5. Choose a VPC. The network interface can reside in the same VPC as your instance or in a different VPC that you own, as long as the network interface is in the same Availability Zone as the instance. This enables you to create multi-homed instances across VPCs with different networking and security configurations.
6. Select a network interface. If the instance supports multiple network cards, you can choose a network card.
7. Choose **Attach**.

To attach a network interface using the Network Interfaces page

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. Choose **Actions**, **Attach**.
5. Choose an instance. If the instance supports multiple network cards, you can choose a network card.
6. Choose **Attach**.

AWS CLI

To attach a network interface

Use the following attach-network-interface command.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-1234567890abcdef0 \
    --instance-id i-1234567890abcdef0 \
    --device-index 1
```

PowerShell

To attach a network interface

Use the Add-EC2NetworkInterface cmdlet.

```
Add-EC2NetworkInterface `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -InstanceId i-1234567890abcdef0 `
    -DeviceIndex 1
```

Detach a network interface

You can detach a secondary network interface that is attached to an EC2 instance at any time, using either the **Instances** or **Network Interfaces** page of the Amazon EC2 console.

If you try to detach a network interface that is attached to a resource from another service, such as an Elastic Load Balancing load balancer, a Lambda function, a WorkSpace, or a NAT gateway, you get an error that you do not have permission to access the resource. To find which service created the resource attached to a network interface, check the description of the network interface. If you delete the resource, then its network interface is deleted.

Console

To detach a network interface using the Instances page

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the checkbox for the instance. Check the **Network interfaces** section of the **Networking** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions**, **Networking**, **Detach network interface**.
5. Select the network interface and choose **Detach**.

To detach a network interface using the Network Interfaces page

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface. Check the **Instance details** section of the **Details** tab to verify that the network interface is attached to an instance as a secondary network interface.
4. Choose **Actions**, **Detach**.
5. When prompted for confirmation, choose **Detach**.
6. If the network interface fails to detach from the instance, choose **Force detachment**, **Enable** and then try again. We recommend that force detachment only as a last resort. Forcing a detachment can prevent you from attaching a different network interface on the same index until you restart the instance. It can also prevent the instance metadata from reflecting that the network interface was detached until you restart the instance.

AWS CLI

To detach a network interface

Use the following detach-network-interface command.

```
aws ec2 detach-network-interface --attachment-id eni-attach-016c93267131892c9
```

PowerShell

To detach a network interface

Use the Dismount-EC2NetworkInterface cmdlet.

```
Dismount-EC2NetworkInterface -AttachmentId eni-attach-016c93267131892c9
```

Manage the IP addresses for your network interface

You can manage the following IP addresses for your network interfaces:

- Elastic IP addresses (one per private IPv4 address)

- IPv4 addresses
- IPv6 addresses

Console

To manage the IP addresses of a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To manage the IPv4 and IPv6 addresses, do the following:
   a. Choose **Actions**, **Manage IP addresses**.
   b. Expand the network interface.
   c. For **IPv4 addresses**, edit the IP addresses as needed. To assign an additional IPv4 address, choose **Assign new IP address** and then specify an IPv4 address from the subnet range or let AWS choose one for you.
   d. (Dual stack or IPv6 only) For **IPv6 addresses**, edit the IP addresses as needed. To assign an additional IPv6 address, choose **Assign new IP address** and then specify an IPv6 address from the subnet range or let AWS choose one for you.
   e. To assign or unassign a public IPv4 address to a network interface, choose **Auto-assign public IP**. You can enable or disable this for any network interface, but it only affects the primary network interface.
   f. (Dual stack or IPv6-only) For **Assign primary IPv6 IP**, choose **Enable** to assign a primary IPv6 address. The first GUA associated with the network interface is chosen as the primary IPv6 address. After you assign a primary IPv6 address, you can't change it. This address is the primary IPv6 address until the instance is terminated or the network interface is detached.
   g. Choose **Save**.
5. To associate an Elastic IP address, do the following:
   a. Choose **Actions**, **Associate address**.
   b. For **Elastic IP address**, select the Elastic IP address.
   c. For **Private IPv4 address**, select the private IPv4 address to associate with the Elastic IP address.

d. (Optional) Choose **Allow the Elastic IP address to be reassociated** if the network interface is currently associated with another instance or network interface.

e. Choose **Associate**.

6. To disassociate an Elastic IP address, do the following:

a. Choose **Actions**, **Disassociate address**.

b. For **Public IP address**, select the Elastic IP address.

c. Choose **Disassociate**.

AWS CLI

To manage the IPv4 addresses

Use the following assign-private-ip-addresses command to assign an IPv4 address.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --private-ip-addresses 10.0.0.82
```

Use the following unassign-private-ip-addresses command to unassign an IPv4 address.

```
aws ec2 unassign-private-ip-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --private-ip-addresses 10.0.0.82
```

To manage the IPv6 addresses

Use the following assign-ipv6-addresses command to assign an IPv6 address.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --ipv6-addresses 2001:db8:1234:1a00:9691:9503:25ad:1761
```

Use the following unassign-ipv6-addresses command to unassign an IPv6 address.

```
aws ec2 unassign-ipv6-addresses \
    --network-interface-id eni-1234567890abcdef0 \
    --ipv6-addresses 2001:db8:1234:1a00:9691:9503:25ad:1761
```

To manage the Elastic IP address for the primary private IPv4 address

Use the following associate-address command to associate an Elastic IP address with the primary private IPv4 address.

```
aws ec2 associate-address \
    --allocation-id eipalloc-0b263919b6EXAMPLE \
    --network-interface-id eni-1234567890abcdef0
```

Use the following disassociate-address command to disassociate an Elastic IP address from the primary private IPv4 address.

```
aws ec2 disassociate-address --association-id eipassoc-2bebb745a1EXAMPLE
```

PowerShell

To manage the IPv4 addresses

Use the Register-EC2PrivateIpAddress cmdlet to assign an IPv4 address.

```
Register-EC2PrivateIpAddress `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -PrivateIpAddress 10.0.0.82
```

Use the Unregister-EC2PrivateIpAddress cmdlet to unassign an IPv4 address.

```
Unregister-EC2PrivateIpAddress `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -PrivateIpAddress 10.0.0.82
```

To manage the IPv6 addresses

Use the Register-EC2Ipv6AddressList cmdlet to assign an IPv6 address.

```
Register-EC2Ipv6AddressList `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Ipv6Address 2001:db8:1234:1a00:9691:9503:25ad:1761
```

Use the Unregister-EC2Ipv6AddressList cmdlet to unassign an IPv6 address.

```
Unregister-EC2Ipv6AddressList `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Ipv6Address 2001:db8:1234:1a00:9691:9503:25ad:1761
```

To manage the Elastic IP address for the primary private IPv4 address

Use the Register-EC2Address cmdlet to associate an Elastic IP address with the primary private IPv4 address.

```
Register-EC2Address `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -AllocationId eipalloc-0b263919b6EXAMPLE
```

Use the Unregister-EC2Address cmdlet to disassociate an Elastic IP address from the primary private IPv4 address.

```
Unregister-EC2Address -AssociationId eipassoc-2bebb745a1EXAMPLE
```

Modify network interface attributes

You can change the following network interface attributes:

- Description
- Security groups
- Delete on termination
- Source/destination check
- Idle connection tracking timeout

Considerations

You can't change the attributes of a requester-managed network interface.

Console

To modify network interface attributes

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.

2. In the navigation pane, choose **Network Interfaces**.
3. Select the checkbox for the network interface.
4. To change the description, do the following

   a. Choose **Actions**, **Change description**.

   b. For **Description**, enter a description.

   c. Choose **Save**.
5. To change the security groups, do the following:

   a. Choose **Actions**, **Change security groups**.

   b. For **Associated security groups**, add and remove security groups as needed. The security group and network interface must be created for the same VPC.

   c. Choose **Save**.
6. To change the termination behavior, do the following:

   a. Choose **Actions**, **Change termination behavior**.

   b. Select or clear **Delete on termination**, **Enable**.

   c. Choose **Save**.
7. To change source/destination checking, do the following:

   a. Choose **Actions**, **Change source/dest check**.

   b. Select or clear **Source/destination check**, **Enable**.

   c. Choose **Save**.
8. To change idle connection tracking timeouts, do the following:

   a. Choose **Actions**, **Modify idle connection tracking timeout**.

   b. Modify timeout values as needed. For more information, see Idle connection tracking timeout.

      - **TCP established timeout**: Timeout (in seconds) for idle TCP connections in an established state.
        - Min: `60` seconds
        - Max: `432000` seconds
        - Default: `350` seconds for Nitro v6 instance types (excluding P6e-GB200); `432000` seconds for all other instance types (including P6e-GB200).

- Recommended: Less than 432000 seconds
- **UDP timeout**: Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction.
  - Min: 30 seconds
  - Max: 60 seconds
  - Default: 30 seconds
- **UDP stream timeout**: Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction.
  - Min: 60 seconds
  - Max: 180 seconds
  - Default: 180 seconds

c. Choose **Save**.

AWS CLI

Example: To modify the description

Use the following modify-network-interface-attribute command.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --description "my updated description"
```

Example: To modify the security groups

Use the following modify-network-interface-attribute command.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --groups sg-1234567890abcdef0
```

Example: To modify the termination behavior

Use the following modify-network-interface-attribute command.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
```

```
    --attachment AttachmentId=eni-attach-43348162abEXAMPLE,DeleteOnTermination=false
```

Example: To enable source/destination checking

Use the following modify-network-interface-attribute command.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --source-dest-check
```

Example: To modify idle connection tracking timout

Use the following modify-network-interface-attribute command. For more information, see Idle connection tracking timeout.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --connection-tracking-specification
 TcpEstablishedTimeout=172800,UdpStreamTimeout=90,UdpTimeout=60
```

PowerShell

Example: To modify the description

Use the Edit-EC2NetworkInterfaceAttribute cmdlet.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Description "my updated description"
```

Example: To modify the security groups

Use the Edit-EC2NetworkInterfaceAttribute cmdlet.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Group sg-1234567890abcdef0
```

Example: To modify the termination behavior

Use the Edit-EC2NetworkInterfaceAttribute cmdlet.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -Attachment_AttachmentId eni-attach-43348162abEXAMPLE `
    -Attachment_DeleteOnTermination $false
```

Example: To enable source/destination checking

Use the Edit-EC2NetworkInterfaceAttribute cmdlet.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -SourceDestCheck $true
```

Example: To modify idle connection tracking timeouts

Use the Edit-EC2NetworkInterfaceAttribute cmdlet. For more information, see Idle connection tracking timeout.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -ConnectionTrackingSpecification_TcpEstablishedTimeout 172800 `
    -ConnectionTrackingSpecification_UdpStreamTimeout 90 `
    -ConnectionTrackingSpecification_UdpTimeout 60
```

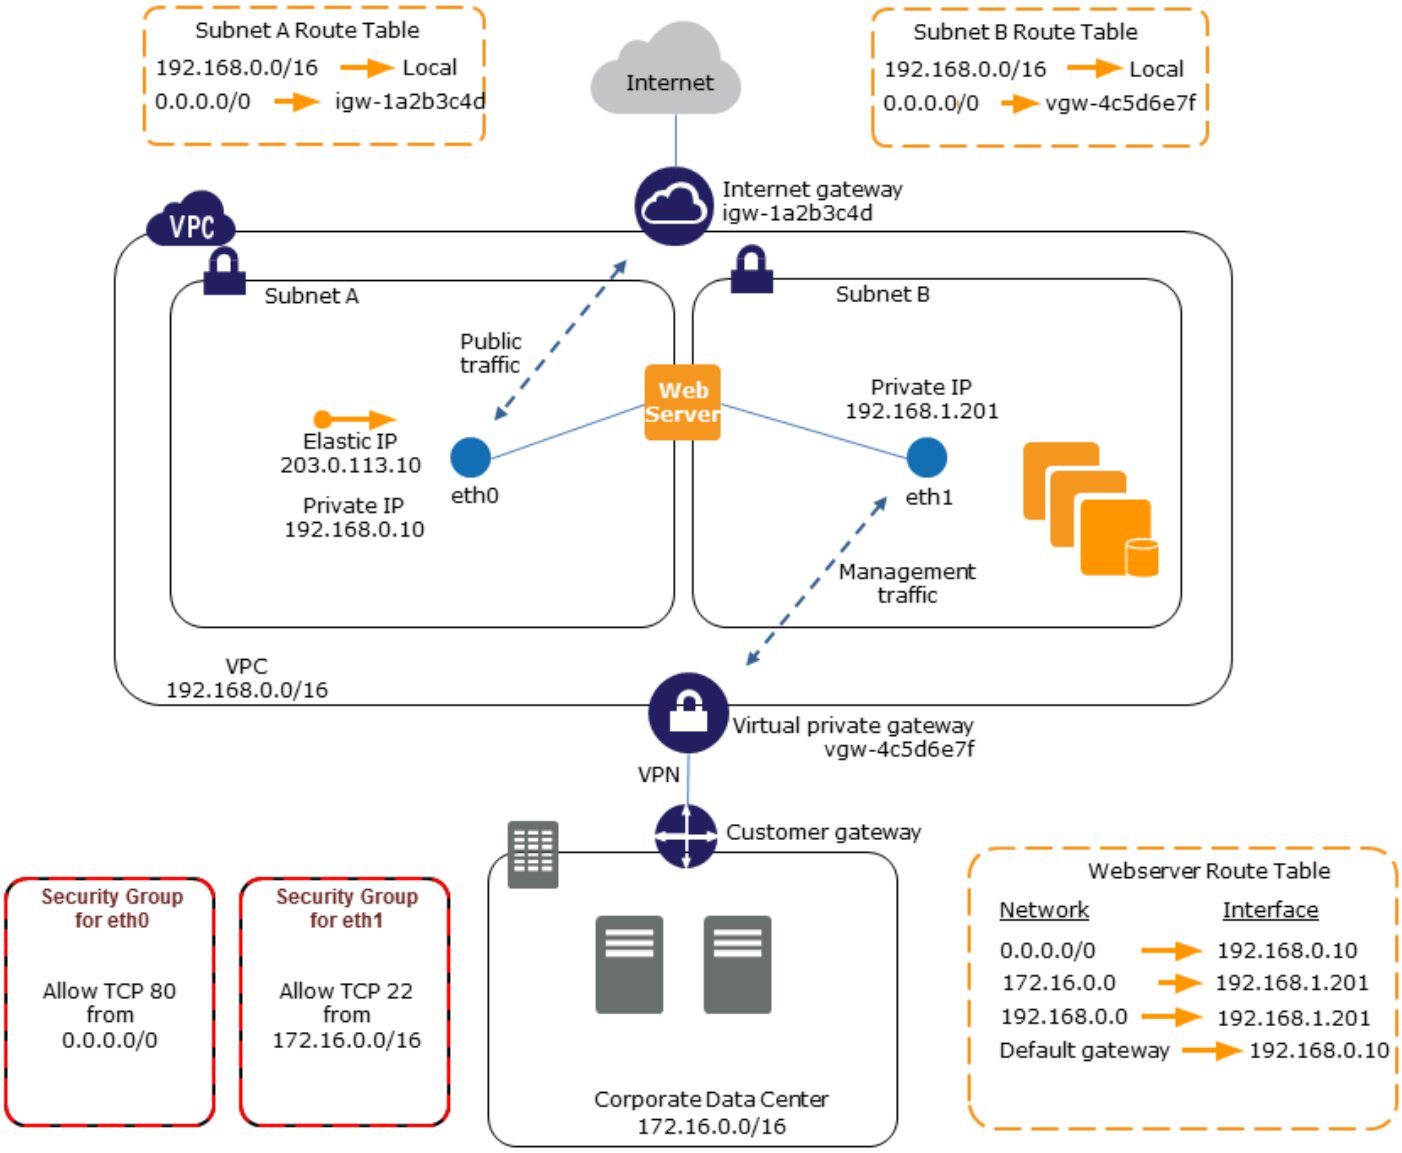
Multiple network interfaces for your Amazon EC2 instances

Attaching multiple network interfaces to an instance is useful when you need the following:

- A management network.
- Network and security appliances.
- Dual-homed instances with workloads in different subnets or VPCs.
- A low-budget, high-availability solution.

Management network

The following overview describes a management network created using multiple network interfaces.



Criteria

- The primary network interface on the instance (for example, eth0) handles public traffic.
- The secondary network interface on the instance (for example, eth1) handles backend management traffic. It's connected to a separate subnet that has more restrictive access controls, and is located within the same Availability Zone as the primary network interface.

Settings

- The primary network interface, which may or may not be behind a load balancer, has an associated security group that allows access to the server from the internet. For example, allow TCP port 80 and 443 from 0.0.0.0/0 or from the load balancer.
- The secondary network interface has an associated security group that allows SSH access only, initiated from one of the following locations:
  - An allowed range of IP addresses, either within the VPC, or from the internet.
  - A private subnet within the same Availability Zone as the primary network interface.
  - A virtual private gateway.

> **Note**
>
> To ensure failover capabilities, consider using a secondary private IPv4 for incoming traffic on a network interface. In the event of an instance failure, you can move the interface and/or secondary private IPv4 address to a standby instance.

Network and security appliances

Some network and security appliances, such as load balancers, network address translation (NAT) servers, and proxy servers prefer to be configured with multiple network interfaces. You can create and attach secondary network interfaces to instances that are running these types of applications and configure the additional interfaces with their own public and private IP addresses, security groups, and source/destination checking.

Dual-homed instances with workloads in different subnets

You can place a network interface on each of your web servers that connects to a mid-tier network where an application server resides. The application server can also be dual-homed to a backend network (subnet) where the database server resides. Instead of routing network packets through the dual-homed instances, each dual-homed instance receives and processes requests on the front end, initiates a connection to the backend, and then sends requests to the servers on the backend network.

Dual-homed instances with workloads in different VPCs in the same account

You can launch an EC2 instance in one VPC and attach a secondary ENI from a different VPC, as long as the network interface is in the same Availability Zone as the instance. This enables you to create multi-homed instances across VPCs with different networking and security configurations. You can't create multi-homed instances across VPCs in different AWS accounts.

You can use dual-homed instances across VPCs in the following use cases:

- **Overcome CIDR overlaps between two VPCs that can’t be peered together**: You can leverage a secondary CIDR in a VPC and allow an instance to communicate across two non-overlapping IP ranges.
- **Connect multiple VPCs within a single account**: Enable communication between individual resources that would normally be separated by VPC boundaries.

Low-budget, high-availability solution

If one of your instances serving a particular function fails, its network interface can be attached to a replacement or hot standby instance pre-configured for the same role to rapidly recover the service. For example, you can use a network interface as your primary or secondary network interface to a critical service such as a database instance or a NAT instance. If the instance fails, you (or more likely, the code running on your behalf) can attach the network interface to a hot standby instance. Because the interface maintains its private IP addresses, Elastic IP addresses, and MAC address, network traffic begins flowing to the standby instance as soon as you attach the network interface to the replacement instance. Users experience a brief loss of connectivity between the time the instance fails and the time that the network interface is attached to the standby instance, but no changes to the route table or your DNS server are required.

Requester-managed network interfaces

A requester-managed network interface is a network interface that an AWS service creates in your VPC on your behalf. The network interface is associated with a resource for another service, such as a DB instance from Amazon RDS, a NAT gateway, or an interface VPC endpoint from AWS PrivateLink.

Considerations

- You can view the requester-managed network interfaces in your account and you can add or remove tags. However, you can't perform the following actions on a requester-managed network interface:
  - Modify network interface attributes
  - Attach or detach the network interface
  - Associate or disassociate Elastic IP addresses
  - Assign or unassign private IP addresses
  - Specify the network interface when launching an instance

  You can still reset network interface attributes, even though you can't modify them.
- When you delete the resource associated with a requester-managed network interface, the AWS service detaches the network interface and deletes it. If the service detached a network interface but didn't delete it, you can delete the detached network interface.

Console

To view requester-managed network interfaces

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network & Security**, **Network Interfaces**.
3. Select the ID of the network interface to open its details page.
4. The following are the key fields that you can use to determine the purpose of the network interface:
   - **Description**: A description provided by the AWS service that created the interface. For example, "VPC Endpoint Interface vpce 089f2123488812123".
   - **Requester-managed**: Indicates whether the network interface is managed by AWS.

- **Requester ID**: The alias or AWS account ID of the principal or service that created the network interface. If you created the network interface, this is your AWS account ID. Otherwise, another principal or service created it.

AWS CLI

To view requester-managed network interfaces

Use the describe-network-interfaces command as follows.

```
aws ec2 describe-network-interfaces \
    --filters "Name=requester-managed,Values=true" \
    --query "NetworkInterfaces[*].[Description, InterfaceType]" \
    --output table
```

The following is example output that shows the key fields that you can use to determine the purpose of the network interface: `Description` and `InterfaceType`.

```
-------------------------------------------------------------------------
|                         DescribeNetworkInterfaces                     |
+---------------------------------------------------+-------------------+
|  VPC Endpoint Interface: vpce-0f00567fa8477a1e6   |  interface        |
|  VPC Endpoint Interface vpce-0d8ddce4be80e4474    |  interface        |
|  VPC Endpoint Interface vpce-078221a1e27d1ea5b    |  vpc_endpoint     |
|  Resource Gateway Interface rgw-0bba03f3d56060135 |  interface        |
|  VPC Endpoint Interface: vpce-0cc199f605eaeace7   |  interface        |
|  VPC Endpoint Interface vpce-019b90d6f16d4f958    |  interface        |
+---------------------------------------------------+-------------------+
```

PowerShell

To view requester-managed network interfaces

Use the Get-EC2NetworkInterface cmdlet as follows.

```
Get-EC2NetworkInterface -Filter @{Name="requester-managed"; Values="true"} | Select
 Description, InterfaceType
```

The following is example output that shows the key fields that you can use to determine the purpose of a network interface: `Description` and `InterfaceType`.

```
Description                                        InterfaceType
-----------                                        -------------
VPC Endpoint Interface: vpce-0f00567fa8477a1e6   interface
VPC Endpoint Interface vpce-0d8ddce4be80e4474    interface
VPC Endpoint Interface vpce-078221a1e27d1ea5b    vpc_endpoint
Resource Gateway Interface rgw-0bba03f3d56060135 interface
VPC Endpoint Interface: vpce-0cc199f605eaeace7   interface
VPC Endpoint Interface vpce-019b90d6f16d4f958    interface
```

Prefix delegation for Amazon EC2 network interfaces

You can assign a private IPv4 or IPv6 CIDR range, either automatically or manually, to your network interfaces. By assigning prefixes, you scale and simplify the management of applications, including container and networking applications that require multiple IP addresses on an instance. For more information about IPv4 and IPv6 addresses, see Amazon EC2 instance IP addressing.

The following assignment options are available:

- **Automatic assignment** — AWS chooses the prefix and assigns it to your network interface. If the subnet for the network interface has a subnet CIDR reservation of type `prefix`, we select the prefixes from the subnet CIDR reservation. Otherwise, we select them from the subnet CIDR range.
- **Manual assignment** — You specify the prefix and AWS verifies that it is not already assigned to other resources before assigning it to your network interface.

Assigning prefixes has the following benefits:

- Increased IP addresses on a network interface — When you use a prefix, you assign a block of IP addresses as opposed to individual IP addresses. This increases the number of IP addresses for a network interface.
- Simplified VPC management for containers — In container applications, each container requires a unique IP address. Assigning prefixes to your instance simplifies the management of your VPCs, as you can launch and terminate containers without having to call Amazon EC2 APIs for individual IP assignments.

Contents

- Basics

- Considerations
- Manage prefixes for your network interfaces
  - Assign prefixes during network interface creation
  - Assign prefixes to an existing network interface
  - Remove prefixes from your network interfaces

Basics

- You can assign a prefix to new or existing network interfaces.
- To use prefixes, you assign a prefix to your network interface, attach the network interface to your instance, and then configure your operating system.
- When you choose the option to specify a prefix, the prefix must meet the following requirements:
  - The IPv4 prefix that you can specify is `/28`.
  - The IPv6 prefix that you can specify is `/80`.
  - The prefix is in the subnet CIDR of the network interface, and does not overlap with other prefixes or IP addresses assigned to existing resources in the subnet.
- You can assign a prefix to the primary or secondary network interface.
- You can assign an Elastic IP address to a network interface that has a prefix assigned to it.
- You can also assign an Elastic IP address to the IP address part of the assigned prefix.
- We resolve the private DNS host name of an instance to the primary private IPv4 address.
- We assign each private IPv4 address for a network interface, including those from prefixes, using the following format:
  - `eusc-de-east-1` Region

    ```
    ip-private-ipv4-address.ec2.internal
    ```

  - All other Regions

    ```
    ip-private-ipv4-address.region.compute.internal
    ```

Considerations

Take the following into consideration when you use prefixes:

- Network interfaces with prefixes are supported with Nitro-based instances.
- Prefixes for network interfaces must use IPv6 addresses or private IPv4 addresses.
- The maximum number of IP addresses that you can assign to a network interface depends on the instance type. Each prefix that you assign to a network interface counts as one IP address. For example, a `c5.large` instance has a limit of `10` IPv4 addresses per network interface. Each network interface for this instance has a primary IPv4 address. If a network interface has no secondary IPv4 addresses, you can assign up to 9 prefixes to the network interface. For each additional IPv4 address that you assign to a network interface, you can assign one less prefix to the network interface. For more information, see Maximum IP addresses per network interface.
- Prefixes are included in source/destination checks.
- You must configure your operating system to work with network interfaces with prefixes. Note the following:
  - Some Amazon Linux AMIs contain additional scripts installed by AWS, known as `ec2-net-utils`. These scripts optionally automate the configuration of your network interfaces. They are for use only on Amazon Linux.
  - For containers, you can use a Container Network Interface (CNI) for the Kubernetes plug-in, or `dockerd` if you use Docker to manage your containers.

Manage prefixes for your network interfaces

When you assign prefixes to a network interface, you can choose whether to let us automatically assign the prefixes or you can specify custom prefixes. If you let us automatically assign prefixes and the subnet for the network interface has a subnet CIDR reservation of type `prefix`, we select the prefixes from the subnet CIDR reservation. Otherwise, we select them from the subnet CIDR range.

Tasks

- Assign prefixes during network interface creation
- Assign prefixes to an existing network interface
- Remove prefixes from your network interfaces

Assign prefixes during network interface creation

You can assign automatic or custom prefixes when you create a network interface.

Console

To assign automatic prefixes during network interface creation

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Choose **Create network interface**.
4. Enter a description for the network interface, select the subnet in which to create the network interface, and configure the private IPv4 and IPv6 addresses.
5. Expand **Advanced settings**.
6. For **IPv4 prefix delegation** do one of the following:
   - To automatically assign an IPv4 prefix, choose **Auto-assign**. For **Number of IPv4 prefixes**, enter the number of prefixes to assign.
   - To assign a specific IPv4 prefix, choose **Custom**. Choose **Add new prefix** and enter the prefix.
7. For **IPv6 prefix delegation** do one of the following:
   - To automatically assign an IPv6 prefix, choose **Auto-assign**. For **Number of IPv6 prefixes**, enter the number of prefixes to assign.
   - To assign a specific IPv6 prefix, choose **Custom**. Choose **Add new prefix** and enter the prefix.

   > **Note**
   >
   > **IPv6 prefix delegation** appears only if the selected subnet is enabled for IPv6.

8. Select the security groups to associate with the network interface and assign resource tags if needed.
9. Choose **Create network interface**.

AWS CLI

To assign automatic IPv4 prefixes during network interface creation

Use the create-network-interface command and set `--ipv4-prefix-count` to the number of IPv4 prefixes for AWS to assign. In the following example, AWS assigns one IPv4 prefix.

```
aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv4 automatic example" \
    --ipv4-prefix-count 1
```

To assign specific IPv4 prefixes during network interface creation

Use the create-network-interface command and set `--ipv4-prefixes` to the prefixes. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is 10.0.0.208/28.

```
aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv4 manual example" \
    --ipv4-prefixes Ipv4Prefix=10.0.0.208/28
```

To assign automatic IPv6 prefixes during network interface creation

Use the create-network-interface command and set `--ipv6-prefix-count` to the number of IPv6 prefixes for AWS to assign. In the following example, AWS assigns one IPv6 prefix.

```
aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv6 automatic example" \
    --ipv6-prefix-count 1
```

To assign specific IPv6 prefixes during network interface creation

Use the create-network-interface command and set `--ipv6-prefixes` to the prefixes. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:1768::/80.

```
aws ec2 create-network-interface \
    --subnet-id subnet-047cfed18eEXAMPLE \
    --description "IPv6 manual example" \
    --ipv6-prefixes Ipv6Prefix=2600:1f13:fc2:a700:1768::/80
```

PowerShell

To assign automatic IPv4 prefixes during network interface creation

Use the New-EC2NetworkInterface cmdlet and set `Ipv4PrefixCount` to the number of IPv4 prefixes for AWS to assign. In the following example, AWS assigns one IPv4 prefix.

```
New-EC2NetworkInterface `
    -SubnetId 'subnet-047cfed18eEXAMPLE' `
    -Description 'IPv4 automatic example' `
    -Ipv4PrefixCount 1
```

To assign specific IPv4 prefixes during network interface creation

Use the New-EC2NetworkInterface cmdlet and set `Ipv4Prefix` to the prefixes. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is 10.0.0.208/28.

```
Import-Module AWS.Tools.EC2
New-EC2NetworkInterface `
    -SubnetId 'subnet-047cfed18eEXAMPLE' `
    -Description 'IPv4 manual example' `
    -Ipv4Prefix (New-Object `
        -TypeName Amazon.EC2.Model.Ipv4PrefixSpecificationRequest `
        -Property @{Ipv4Prefix = '10.0.0.208/28'})
```

To assign automatic IPv6 prefixes during network interface creation

Use the New-EC2NetworkInterface cmdlet and set `Ipv6PrefixCount` to the number of IPv6 prefixes for AWS to assign. In the following example, AWS assigns one IPv6 prefix.

```
New-EC2NetworkInterface `
    -SubnetId 'subnet-047cfed18eEXAMPLE' `
    -Description 'IPv6 automatic example' `
    -Ipv6PrefixCount 1
```

To assign specific IPv6 prefixes during network interface creation

Use the New-EC2NetworkInterface cmdlet and set `Ipv6Prefixes` to the prefixes. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:1768::/80.

```
Import-Module AWS.Tools.EC2
New-EC2NetworkInterface `
    -SubnetId 'subnet-047cfed18eEXAMPLE' `
    -Description 'IPv6 manual example' `
    -Ipv6Prefix (New-Object `
        -TypeName Amazon.EC2.Model.Ipv6PrefixSpecificationRequest `
        -Property @{Ipv6Prefix = '2600:1f13:fc2:a700:1768::/80'})
```

Assign prefixes to an existing network interface

You can assign automatic or custom prefixes to an existing network interface.

Console

To assign automatic prefixes to an existing network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface to which to assign the prefixes, and choose **Actions**, **Manage prefixes**.
4. For **IPv4 prefix delegation** do one of the following:
   - To automatically assign an IPv4 prefix, choose **Auto-assign**. For **Number of IPv4 prefixes**, enter the number of prefixes to assign.
   - To assign a specific IPv4 prefix, choose **Custom**. Choose **Add new prefix** and enter the prefix.
5. For **IPv6 prefix delegation** do one of the following:
   - To automatically assign an IPv6 prefix, choose **Auto-assign**. For **Number of IPv6 prefixes**, enter the number of prefixes to assign.
   - To assign a specific IPv6 prefix, choose **Custom**. Choose **Add new prefix** and enter the prefix.

   > **Note**
   >
   > **IPv6 prefix delegation** appears only if the selected subnet is enabled for IPv6.

6. Choose **Save**.

AWS CLI

Use the assign-ipv6-addresses command to assign IPv6 prefixes and the assign-private-ip-addresses command to assign IPv4 prefixes to existing network interfaces.

To assign automatic IPv4 prefixes to an existing network interface

Use the assign-private-ip-addresses command and set `--ipv4-prefix-count` to the number of IPv4 prefixes for AWS to assign. In the following example, AWS assigns one IPv4 prefix.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-id eni-081fbb4095EXAMPLE \
    --ipv4-prefix-count 1
```

To assign specific IPv4 prefixes to an existing network interface

Use the assign-private-ip-addresses command and set `--ipv4-prefixes` to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is 10.0.0.208/28.

```
aws ec2 assign-private-ip-addresses \
    --network-interface-id eni-081fbb4095EXAMPLE \
    --ipv4-prefixes 10.0.0.208/28
```

To assign automatic IPv6 prefixes to an existing network interface

Use the assign-ipv6-addresses command and set `--ipv6-prefix-count` to the number of IPv6 prefixes for AWS to assign. In the following example, AWS assigns one IPv6 prefix.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-00d577338cEXAMPLE \
    --ipv6-prefix-count 1
```

To assign specific IPv6 prefixes to an existing network interface

Use the assign-ipv6-addresses command and set `--ipv6-prefixes` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:18bb::/80.

```
aws ec2 assign-ipv6-addresses \
    --network-interface-id eni-00d577338cEXAMPLE \
```

```
    --ipv6-prefixes 2600:1f13:fc2:a700:18bb::/80
```

PowerShell

To assign automatic IPv4 prefixes to an existing network interface

Use the Register-EC2PrivateIpAddress cmdlet and set `Ipv4PrefixCount` to the number of IPv4 prefixes for AWS to assign. In the following example, AWS assigns one IPv4 prefix.

```
Register-EC2PrivateIpAddress `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv4PrefixCount 1
```

To assign specific IPv4 prefixes to an existing network interface

Use the Register-EC2PrivateIpAddress cmdlet and set `Ipv4Prefix` to the prefix. AWS selects IPv4 addresses from this range. In the following example, the prefix CIDR is 10.0.0.208/28.

```
Register-EC2PrivateIpAddress `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv4Prefix '10.0.0.208/28'
```

To assign automatic IPv6 prefixes to an existing network interface

Use the Register-EC2Ipv6AddressList cmdlet and set `Ipv6PrefixCount` to the number of IPv4 prefixes for AWS to assign. In the following example, AWS assigns one IPv6 prefix.

```
Register-EC2Ipv6AddressList `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv6PrefixCount 1
```

To assign specific IPv6 prefixes to an existing network interface

Use the Register-EC2Ipv6AddressList cmdlet and set `Ipv6Prefix` to the prefix. AWS selects IPv6 addresses from this range. In the following example, the prefix CIDR is 2600:1f13:fc2:a700:18bb::/80.

```
Register-EC2Ipv6AddressList `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv6Prefix '2600:1f13:fc2:a700:18bb::/80'
```

Remove prefixes from your network interfaces

You can remove prefixes from an existing network interface.

Console

To remove the prefixes from a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.
3. Select the network interface.
4. Choose **Actions**, **Manage prefixes**.
5. For **IPv4 prefix delegation**, to remove specific prefixes, choose **Unassign** next to the prefixes to remove. To remove all prefixes, choose **Do not assign**.
6. For **IPv6 prefix delegation**, to remove specific prefixes, choose **Unassign** next to the prefixes to remove. To remove all prefixes, choose **Do not assign**.

   > **Note**
   >
   > **IPv6 prefix delegation** appears only if the selected subnet is enabled for IPv6.

7. Choose **Save**.

AWS CLI

You can use the unassign-ipv6-addresses command to remove IPv6 prefixes and the unassign-private-ip-addresses commands to remove IPv4 prefixes from your existing network interfaces.

To remove IPv4 prefixes from a network interface

Use the unassign-private-ip-addresses command and set `--ipv4-prefix` to the prefix CIDR to remove.

```
aws ec2 unassign-private-ip-addresses \
    --network-interface-id eni-081fbb4095EXAMPLE \
    --ipv4-prefixes 10.0.0.176/28
```

To remove IPv6 prefixes from a network interface

Use the unassign-ipv6-addresses command and set `--ipv6-prefix` to the prefix CIDR to remove.

```
aws ec2 unassign-ipv6-addresses \
    --network-interface-id eni-00d577338cEXAMPLE \
    --ipv6-prefix 2600:1f13:fc2:a700:18bb::/80
```

PowerShell

To remove IPv4 prefixes from a network interface

Use the Unregister-EC2PrivateIpAddress cmdlet and set `Ipv4Prefix` to the prefix CIDR to remove.

```
Unregister-EC2PrivateIpAddress `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv4Prefix '10.0.0.208/28'
```

To remove IPv6 prefixes from a network interface

Use the Unregister-EC2Ipv6AddressList cmdlet and set `Ipv6Prefix` to the prefix CIDR to remove.

```
Unregister-EC2Ipv6AddressList `
    -NetworkInterfaceId 'eni-00d577338cEXAMPLE' `
    -Ipv6Prefix '2600:1f13:fc2:a700:18bb::/80'
```

Delete a network interface

Deleting a network interface releases all attributes associated with the interface and releases any private IP addresses or Elastic IP addresses to be used by another instance.

You can't delete a network interface that is in use. First, you must detach the network interface.

Console

To delete a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces**.

3. Select the checkbox for the network interface, and then choose **Actions**, **Delete**.
4. When prompted for confirmation, choose **Delete**.

AWS CLI

To delete a network interface

Use the following delete-network-interface command.

```
aws ec2 delete-network-interface --network-interface-id eni-1234567890abcdef0
```

PowerShell

To delete a network interface

Use the Remove-EC2NetworkInterface cmdlet.

```
Remove-EC2NetworkInterface -NetworkInterfaceId eni-1234567890abcdef0
```

Amazon EC2 instance network bandwidth

Instance bandwidth specifications apply to both inbound and outbound traffic for the instance. For example, if an instance specifies up to 10 Gbps of bandwidth, that means it has up to 10 Gbps of bandwidth for inbound traffic and, simultaneously, up to 10 Gbps for outbound traffic. The network bandwidth that's available to an EC2 instance depends on several factors, as follows.

Multi-flow traffic

When traffic goes through an internet gateway or a local gateway, the available bandwidth for multi-flow traffic depends on the instance type.

Instance types	Available bandwidth
Instance types with **less than** 32 vCPUs	Limited to 5 Gbps
Instance types with **more than** 32 vCPUs	Limited to 50% of the available bandwidth for the instance type

Instance types	Available bandwidth
C8in, C8ine, M8in, M8ine, M8idn, R8in, R8idn instances	Limited to the baseline bandwidth for the instance type

Single-flow traffic

When instances are not in the same cluster placement group, bandwidth for single-flow traffic is limited to 5 Gbps. To reduce latency and increase single-flow bandwidth, try one of the following:

- Use a cluster placement group to achieve up to 10 Gbps bandwidth for instances within the same placement group.
- Set up multiple paths between two endpoints to achieve higher bandwidth with Multipath TCP (MPTCP).
- Configure ENA Express for eligible instances within the same Availability Zone to achieve up to 25 Gbps between those instances.

> **Note**
>
> A single-flow is considered a unique 5-tuple TCP or UDP flow. For other protocols following the IP header, such as GRE or IPsec, the 3 tuple of source IP, destination IP, and next protocol is used to define a flow.

Available instance bandwidth

The available network bandwidth of an instance depends on the number of vCPUs that it has. For example, an `m5.8xlarge` instance has 32 vCPUs and 10 Gbps network bandwidth, and an `m5.16xlarge` instance has 64 vCPUs and 20 Gbps network bandwidth. However, instances might not achieve this bandwidth; for example, if they exceed network allowances at the instance level, such as packet per second or number of tracked connections. How much of the available bandwidth the traffic can use depends on the number of vCPUs and the destination. For example, an `m5.16xlarge` instance has 64 vCPUs, so traffic to another instance in the Region can use the full bandwidth available (20 Gbps). However, traffic that goes through an internet gateway or a local gateway can use only 50% of the bandwidth available (10 Gbps).

Typically, instances with 16 vCPUs or fewer (size `4xlarge` and smaller) are documented as having "up to" a specified bandwidth; for example, "up to 10 Gbps". These instances have a baseline bandwidth. To meet additional demand, they can use a network I/O credit mechanism to burst beyond their baseline bandwidth. Instances can use burst bandwidth for a limited time, typically from 5 to 60 minutes, depending on the instance size.

An instance receives the maximum number of network I/O credits at launch. If the instance exhausts its network I/O credits, it returns to its baseline bandwidth. A running instance earns network I/O credits whenever it uses less network bandwidth than its baseline bandwidth. A stopped instance does not earn network I/O credits. Instance burst is on a best effort basis, even when the instance has credits available, as burst bandwidth is a shared resource.

There are separate network I/O credit buckets for inbound and outbound traffic.

Base and burst network performance

The *Amazon EC2 Instance Types Guide* describes the network performance for each instance type, plus the baseline network bandwidth available for instances that can use burst bandwidth. For more information, see the following:

- Network specifications – General purpose
- Network specifications – Compute optimized
- Network specifications – Memory optimized
- Network specifications – Storage optimized
- Network specifications – Accelerated computing
- Network specifications – High-performance computing
- Network specifications – Previous generation

Alternatively, you can use a command line tool to get this information. The Amazon EC2 console does not display the baseline network bandwidth of an instance type.

AWS CLI

You can use the describe-instance-types command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
aws ec2 describe-instance-types \
```

```
    --filters "Name=instance-type,Values=c5.*" \
    --query "InstanceTypes[].[InstanceType, NetworkInfo.NetworkPerformance,
 NetworkInfo.NetworkCards[0].BaselineBandwidthInGbps] | sort_by(@,&[2])" \
    --output table
```

The following is example output. If your output is missing the baseline bandwidth, update to the latest version of the AWS CLI.

```
-----------------------------------------------
|           DescribeInstanceTypes             |
+--------------+--------------------+---------+
|  c5.large    |  Up to 10 Gigabit  |  0.75 |
|  c5.xlarge   |  Up to 10 Gigabit  |  1.25 |
|  c5.2xlarge  |  Up to 10 Gigabit  |  2.5  |
|  c5.4xlarge  |  Up to 10 Gigabit  |  5.0  |
|  c5.9xlarge  |  12 Gigabit        |  12.0 |
|  c5.12xlarge |  12 Gigabit        |  12.0 |
|  c5.18xlarge |  25 Gigabit        |  25.0 |
|  c5.24xlarge |  25 Gigabit        |  25.0 |
|  c5.metal    |  25 Gigabit        |  25.0 |
+--------------+--------------------+---------+
```

PowerShell

You can use the Get-EC2InstanceType PowerShell command to display information about an instance type. The following example displays network performance information for all C5 instances.

```
Get-EC2InstanceType -Filter @{Name = "instance-type"; Values = "c5.*" } | `
    Select-Object `
    InstanceType,
    @{Name = 'NetworkPerformance'; Expression =
 {($_.Networkinfo.NetworkCards.NetworkPerformance)}},
    @{Name = 'BaselineBandwidthInGbps'; Expression =
 {($_.Networkinfo.NetworkCards.BaselineBandwidthInGbps)}} | `
Format-Table -AutoSize
```

The following is example output.

```
InstanceType NetworkPerformance BaselineBandwidthInGbps
------------ ------------------ ----------------------
c5.4xlarge   Up to 10 Gigabit                     5.00
```

```
c5.xlarge    Up to 10 Gigabit                 1.25
c5.12xlarge  12 Gigabit                      12.00
c5.9xlarge   12 Gigabit                      12.00
c5.24xlarge  25 Gigabit                      25.00
c5.metal     25 Gigabit                      25.00
c5.2xlarge   Up to 10 Gigabit                 2.50
c5.large     Up to 10 Gigabit                 0.75
c5.18xlarge  25 Gigabit                      25.00
```

EC2 instance bandwidth weighting configuration

Some instance types support configurable bandwidth weighting, where you can select baseline bandwidth weighting that favors either network processing or EBS operations. Default settings for baseline bandwidth are determined by your instance type. You can configure the bandwidth weighting during launch, or modify your instance settings with the following weighting preferences:

- **default** – This option uses the standard bandwidth configuration for your instance type.
- **vpc-1** – This option increases the baseline bandwidth available for networking and decreases the baseline bandwidth for EBS operations.
- **ebs-1** – This option increases the baseline bandwidth available for EBS operations, and decreases the baseline bandwidth for networking.

Bandwidth weighting considerations

The following are some considerations that might affect your bandwidth weighting strategy.

- Setting bandwidth weighting preferences only affects bandwidth specifications. The network packets per second (PPS) and EBS input/output operations per second (IOPS) specifications don't change.
- The combined bandwidth specification between networking and EBS does not change. When you select a bandwidth weighting configuration, the baseline bandwidth available for the selected option increases, and the baseline bandwidth for the remaining option is reduced by the same absolute amount. For all instances except Flex instances, the available burst bandwidth remains the same for your selected option, and is reduced for the remaining option. For Flex instances up to 4xlarge, burst bandwidth remains unchanged. For Flex instances 8xlarge and larger, burst bandwidth increases by the same amount as the baseline bandwidth.

- It's important to understand how changes in bandwidth allocation can affect I/O performance for EBS. For EC2 instances that have `vpc-1` configuration (increased networking bandwidth), you might experience lower IOPS for EBS volumes if you reach the EBS bandwidth limit before you've reached the IOPS limit. This is more noticeable with larger I/O sizes.

  For example, on an instance type that normally supports 240,000 IOPS with 16 KiB I/O size, if you select `vpc-1` weighting, that might reduce the achievable IOPS due to the adjusted EBS baseline bandwidth limit.

  When planning your workload, consider your I/O size and patterns. Smaller I/O sizes are less likely to be affected by bandwidth limitations, while larger I/O sizes or sequential workloads might see more impact from bandwidth changes. Always test your specific workload to ensure optimal performance with your chosen configuration.
- The networking multi-flow bandwidth specification for traffic that goes through an internet gateway or a local gateway is adjusted to 50% of the baseline bandwidth of the configured option or 5 Gbps, where applicable. For more information, see Amazon EC2 instance network bandwidth.

  The following example is based on an instance type that has a default baseline bandwidth of 40 Gbps, and a default border bandwidth of 20 Gbps. If you choose `vpc-1` bandwidth weighting for this instance, the weighted baseline bandwidth changes to 50 Gbps, and the border bandwidth changes to 25 Gbps.
- This feature is available in all commercial Regions, aligned with EC2 instance availablilty and support.
- This feature adds no additional cost to your EC2 instance.

Supported instance types for bandwidth weighting

Instance types in the following instance families support configurable bandwidth weighting.

- **General purpose:** M8a, M8g, M8gd, M8i, M8id, M8i-flex, M9g, M9gd
- **Compute optimized:** C8a, C8g, C8gd, C8i, C8id, C8i-flex, C9g, C9gd
- **Memory optimized:** R8a, R8g, R8gd, R8i, R8id, R8i-flex, R9g, R9gd, X8g, X8aedz, X8i

Check current bandwidth settings

To see the current bandwidth settings for your instance, select one of the tabs for instructions.

Console

To get the bandwidth setting for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that you want to check from the list, and navigate to the **Networking** tab. Your current setting is shown in the **Configured bandwidth** field. Amazon EC2 uses default settings for your instance type if the bandwidth is not set to a specific value.

AWS CLI

To get the bandwidth setting for an instance

Use the describe-instances command.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0 \
    --query Reservations[].Instances[].NetworkPerformanceOptions.BandwidthWeighting
 \
    --output text
```

The following is example output.

```
default
```

This example lists all of your instances that have the bandwidth weighting preference set to `vpc-1`, for higher networking bandwidth.

```
aws ec2 describe-instances \
    --filters "Name=network-performance-options.bandwidth-weighting,Values=vpc-1" \
    --query Reservations[].Instances[].InstanceId \
    --output text
```

PowerShell

To get the bandwidth setting for an instance

Use the Get-EC2Instance cmdlet.

```
(Get-EC2Instance `
```

```
    -
InstanceId i-1234567890abcdef0).Instances.NetworkPerformanceOptions.BandwidthWeighting.Value
```

The following is example output.

```
default
```

This example lists all of your instances that have the bandwidth weighting preference set to `vpc-1`, for higher networking bandwidth.

```
(Get-EC2Instance `
    -Filter @{Name="network-performance-options.bandwidth-
weighting";Values="vpc-1"}).Instances.InstanceId
```

Configure bandwidth weighting for your instance

You can configure bandwidth weighting either at launch or by modifying existing instances from the EC2 console, API/SDKs or CLI.

Configure bandwidth weighting when you launch an instance

To configure bandwidth settings when you launch an instance, select one of the tabs for instructions.

You can also specify bandwidth weighting in a launch template. To create a launch template, see Create an Amazon EC2 launch template. The parameter to set is in the same location as it is for launching an instance directly from the console. Expand the **Advanced details** section, and set the **Instance bandwidth configuration**.

To launch an instance with your launch template, see Launch EC2 instances using a launch template.

Console

To launch an instance with configurable bandwidth weighting

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Choose **Launch instances**. This opens the **Launch an instance** dialog. There are several additional ways that you can get to the launch dialog, depending on your preference.

For example, you can launch an instance directly from an AMI or from the Amazon EC2 dashboard itself.

4. The Amazon Machine Image (AMI) that you launch from must be based on `Arm` architecture. Many **Quick Start** images support both `x86` and `Arm` architectures, After you choose the operating system for your instance, select the `Arm` option from the **Architecture** list.
5. The instance type must be one of the Supported instance types for this feature.
6. When you expand the **Advanced details** section, you can scroll down to find the **Instance bandwidth configuration** settings. Select the bandwidth configuration option for your instance.
7. Configure all of the other settings for your instance as you normally would, and choose **Launch instance**.

AWS CLI

To launch an instance with configurable bandwidth weighting

Use the run-instances command with the following option to launch instances that are configured for higher network bandwidth weighting.

```
--network-performance-options BandwidthWeighting=vpc-1
```

Use the run-instances command with the following option to launch instances that are configured for higher EBS bandwidth weighting.

```
--network-performance-options BandwidthWeighting=ebs-1
```

PowerShell

To launch an instance with configurable bandwidth weighting

Use the New-EC2Instance cmdlet with the following parameter to launch instances that are configured for higher network bandwidth weighting.

```
-NetworkPerformanceOptions_BandwidthWeighting vpc-1
```

Use the New-EC2Instance cmdlet with the following parameter to launch instances that are configured for higher EBS bandwidth weighting.

```
-NetworkPerformanceOptions_BandwidthWeighting ebs-1
```

Update bandwidth weighting for an existing instance

To update bandwidth weighting for an existing instance, your instance must be in the `Stopped` state.

Console

To update bandwidth weighting

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance that you want to update from the list.
4. Before you change the bandwidth configuration, your instance must be in a `Stopped` state. If your instance is running, select **Stop instance** from the **Instance state** menu.
5. Choose **Manage bandwidth** from the **Actions > Networking** menu. This opens the **Manage bandwidth** dialog.

   > **Note**
   >
   > If your instance type doesn't support configuration for bandwidth weighting, that menu item is disabled.

6. Select the option to update your instance, and choose **Change** to save your settings.

AWS CLI

To update bandwidth weighting

Use the modify-instance-network-performance-options command to configure higher network bandwidth weighting for the specified instance.

```
aws ec2 modify-instance-network-performance-options \
    --instance-id i-1234567890abcdef0 \
    --bandwidth-weighting=vpc-1
```

The following example configures higher EBS bandwidth weighting for the specified instance.

```
aws ec2 modify-instance-network-performance-options \
    --instance-id i-1234567890abcdef0 \
    --bandwidth-weighting=ebs-1
```

PowerShell

To update bandwidth weighting

Use the Edit-EC2InstanceNetworkPerformanceOption cmdlet to configure higher network bandwidth weighting for the specified instance.

```
Edit-EC2InstanceNetworkPerformanceOption `
    -InstanceId i-1234567890abcdef0 `
    -BandwidthWeighting vpc-1
```

The following example configures higher EBS bandwidth weighting for the specified instance.

```
Edit-EC2InstanceNetworkPerformanceOption `
    -InstanceId i-1234567890abcdef0 `
    -BandwidthWeighting ebs-1
```

Networking performance

The following table shows the networking performance, in Gbps, that can be achieved with the `default`, `vpc-1`, and `ebs-1` configurations.

Instance type	`default` (Baseline / Burst)	`vpc-1` (Baseline / Burst)	`ebs-1` (Baseline / Burst)
c8a.medium	0.52 / 12.5	0.65 / 12.5	0.438 / 10.0
c8a.large	0.937 / 12.5	1.172 / 12.5	0.774 / 10.0
c8a.xlarge	1.875 / 12.5	2.344 / 12.5	1.562 / 10.0
c8a.2xlarge	3.75 / 15.0	4.688 / 15.0	3.125 / 12.5
c8a.4xlarge	7.5 / 15.0	9.375 / 15.0	6.25 / 12.5

Instance type	default (Baseline / Burst)	vpc-1 (Baseline / Burst)	ebs-1 (Baseline / Burst)
c8a.8xlarge	15.0	18.75	12.5
c8a.12xlarge	22.5	28.125	18.75
c8a.16xlarge	30.0	37.5	25.0
c8a.24xlarge	40.0	50.0	32.5
c8a.48xlarge	75.0	93.75	60.0
c8a.metal-24xl	40.0	50.0	32.5
c8a.metal-48xl	75.0	93.75	60.0
c8g.medium	0.52 / 12.5	0.65 / 12.5	0.441 / 10.0
c8g.large	0.937 / 12.5	1.171 / 12.5	0.779 / 10.0
c8g.xlarge	1.875 / 12.5	2.344 / 12.5	1.562 / 10.0
c8g.2xlarge	3.75 / 15.0	4.688 / 15.0	3.125 / 12.5
c8g.4xlarge	7.5 / 15.0	9.375 / 15.0	6.25 / 12.5
c8g.8xlarge	15.0	18.75	12.5
c8g.12xlarge	22.5	28.125	18.75
c8g.16xlarge	30.0	37.5	25.0
c8g.24xlarge	40.0	50.0	32.5
c8g.48xlarge	50.0	62.5	40.0
c8g.metal-24xl	40.0	50.0	32.5
c8g.metal-48xl	50.0	62.5	40.0

Amazon EBS performance

The following table shows the Amazon EBS performance, in Gbps, that can be achieved with the `default`, `vpc-1`, and `ebs-1` configurations.

Instance type	`default` (Baseline / Burst)	`vpc-1` (Baseline / Burst)	`ebs-1` (Baseline / Burst)
c8a.medium	0.325 / 10.0	0.195 / 6.25	0.407 / 10.0
c8a.large	0.65 / 10.0	0.415 / 6.25	0.813 / 10.0
c8a.xlarge	1.25 / 10.0	0.781 / 6.25	1.563 / 10.0
c8a.2xlarge	2.5 / 10.0	1.562 / 6.25	3.125 / 10.0
c8a.4xlarge	5.0 / 10.0	3.125 / 6.25	6.25 / 10.0
c8a.8xlarge	10.0	6.25	12.5
c8a.12xlarge	15.0	9.375	18.75
c8a.16xlarge	20.0	12.5	25.0
c8a.24xlarge	30.0	20.0	37.5
c8a.48xlarge	60.0	41.25	75.0
c8a.metal-24xl	30.0	20.0	37.5
c8a.metal-48xl	60.0	41.25	75.0

x8i.metal-96xl	80.0	55.0	100.0

Monitor instance bandwidth

You can use CloudWatch metrics to monitor instance network bandwidth and the packets sent and received. You can use the network performance metrics provided by the Elastic Network Adapter (ENA) driver to monitor when traffic exceeds the network allowances that Amazon EC2 defines at the instance level.

You can configure whether Amazon EC2 sends metric data for the instance to CloudWatch using one-minute periods or five-minute periods. It is possible that the network performance metrics would show that an allowance was exceeded and packets were dropped while the CloudWatch instance metrics do not. This can happen when the instance has a short spike in demand for network resources (known as a microburst), but the CloudWatch metrics are not granular enough to reflect these microsecond spikes.

- Instance metrics
- Monitor network performance

Enhanced networking on Amazon EC2 instances

Enhanced networking uses single root I/O virtualization (SR-IOV) to provide high-performance networking capabilities on supported instance types. SR-IOV is a method of device virtualization that provides higher I/O performance and lower CPU utilization when compared to traditional virtualized network interfaces. Enhanced networking provides higher bandwidth, higher packet per second (PPS) performance, and consistently lower latency between instances. There is no additional charge for using enhanced networking.

For information about the supported network speed for each instance type, see Amazon EC2 Instance Types.

You can enable enhanced networking using one of the following mechanisms:

Elastic Network Adapter (ENA)

The Elastic Network Adapter (ENA) supports network speeds of up to 100 Gbps for supported instance types.

All Nitro-based instances use ENA for enhanced networking. In addition, the following Xen-based instances use ENA: H1, I3, G3, `m4.16xlarge`, P3, P3dn, and R4.

For more information, see Enable enhanced networking with ENA on your EC2 instances.

Intel 82599 Virtual Function (VF) interface

The Intel 82599 Virtual Function interface supports network speeds of up to 10 Gbps for supported instance types.

The following instance types use the Intel 82599 VF interface for enhanced networking: C3, C4, D2, I2, M4 (excluding m4.16xlarge), and R3.

For more information, see Enhanced networking with the Intel 82599 VF interface.

- Optimize network performance on EC2 Windows instances

Enable enhanced networking with ENA on your EC2 instances

Amazon EC2 provides enhanced networking capabilities through the Elastic Network Adapter (ENA). To use enhanced networking, you must use an AMI that includes the required ENA driver or manually install it. Then you can enable ENA support on your instance.

To review release notes or install instructions for an ENA driver, see the tab that matches your instance operating system platform.

Linux

You can review the following documentation on GitHub:

- Review ENA Linux kernel driver release notes on GitHub.
- For an overview of the ENA Linux kernel driver that includes install instructions see Linux kernel driver for Elastic Network Adapter (ENA) family on GitHub.

Windows

You can review the following documentation from the **Manage device drivers** section of this guide:

- Track ENA Windows driver version releases.
- Install the ENA driver on EC2 Windows instances.

For Nitro-based instances, enhanced networking capabilities vary by the Nitro version that the instance type implements.

To review network specifications for your instance, choose the instance family link for your instance type. If you're not sure which instance family applies, see Naming conventions in the *Amazon EC2 Instance Types* guide.

- Troubleshoot the Elastic Network Adapter Windows driver

Prerequisites for enhanced networking with ENA

To prepare for enhanced networking using the ENA, set up your instance as follows:

- Launch a Nitro-based instance.
- Ensure that the instance has internet connectivity.
- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating the ENA kernel driver and enabling the `enaSupport` attribute might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.
- **Linux instances** – Launch the instance using a supported version of the Linux kernel and a supported distribution, so that ENA enhanced networking is enabled for your instance automatically. For more information, see ENA Linux Kernel Driver Release Notes.
- **Windows instances** – If the instance is running Windows Server 2008 R2 SP1, ensure that it has the SHA-2 code signing support update.
- Use AWS CloudShell from the AWS Management Console, or install and configure the AWS CLI or the AWS Tools for Windows PowerShell on any computer you choose, preferably your local desktop or laptop. For more information, see Access Amazon EC2 or the AWS CloudShell User Guide. Enhanced networking cannot be managed from the Amazon EC2 console.

Test whether enhanced networking is enabled

You can test whether enhanced networking is enabled in your instances or your AMIs.

Instance attribute

Check the value of the `enaSupport` instance attribute.

AWS CLI

Use the describe-instances command.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0 \
    --query "Reservations[].Instances[].EnaSupport"
```

If enhanced networking is enabled, the output is as follows.

```
[
    true
]
```

PowerShell

Use the Get-EC2Instance cmdlet.

```
(Get-EC2Instance -InstanceId i-1234567890abcdef0).Instances.EnaSupport
```

If enhanced networking is enabled, the output is as follows.

```
True
```

Image attribute

Check the value of the `enaSupport` image attribute.

AWS CLI

Use the describe-images command.

```
aws ec2 describe-images \
```

```
    --image-id ami-0abcdef1234567890 \
    --query "Images[].EnaSupport"
```

If enhanced networking is enabled, the output is as follows.

```
[
    true
]
```

PowerShell

Use the Get-EC2Image cmdlet.

```
(Get-EC2Image -ImageId ami-0abcdef1234567890).EnaSupport
```

If enhanced networking is enabled, the output is as follows.

```
True
```

Linux network interface driver

Use the following command to verify that the `ena` kernel driver is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface (default), this is `eth0`. If your Linux distribution supports predictable network names, this could be a name like `ens5`. For more information, expand the section for RHEL, SUSE, and CentOS in Enable enhanced networking on your instance.

In the following example, the `ena` kernel driver is not loaded, because the listed driver is `vif`.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

In this example, the ena kernel driver is loaded and at the minimum recommended version. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ena
version: 1.5.0g
firmware-version:
expansion-rom-version:
bus-info: 0000:00:05.0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
supports-register-dump: no
supports-priv-flags: no
```

Enable enhanced networking on your instance

The procedure that you use depends on the operating system of the instance.

Amazon Linux

The AMIs for Amazon Linux include the kernel driver required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with an HVM version of Amazon Linux on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

Ubuntu

The latest Ubuntu HVM AMIs include the kernel driver required for enhanced networking with ENA installed and have ENA support enabled. Therefore, if you launch an instance with the latest Ubuntu HVM AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

If you launched your instance using an older AMI and it does not have enhanced networking enabled already, you can install the `linux-aws` kernel package to get the latest enhanced networking drivers and update the required attribute.

To install the `linux-aws` kernel package (Ubuntu 16.04 or later)

Ubuntu 16.04 and 18.04 ship with the Ubuntu custom kernel (`linux-aws` kernel package). To use a different kernel, contact Support.

To install the `linux-aws` kernel package (Ubuntu Trusty 14.04)

1. Connect to your instance.
2. Update the package cache and packages.

```
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

> **Important**
>
> If during the update process you are prompted to install `grub`, use `/dev/xvda` to install `grub` onto, and then choose to keep the current version of `/boot/grub/menu.lst`.

3. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI) or Stop-EC2Instance (AWS Tools for Windows PowerShell).

   [Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: To enable enhanced networking on Ubuntu (instance store-backed instances).
4. From your local computer, enable the enhanced networking attribute using one of the following commands:

   - modify-instance-attribute (AWS CLI)

     ```
     aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --ena-support
     ```

   - Edit-EC2InstanceAttribute (Tools for Windows PowerShell)

     ```
     Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -EnaSupport $true
     ```

5. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking `enaSupport` attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).

To enable enhanced networking on Ubuntu (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an Amazon S3-backed AMI, making sure to enable the enhanced networking attribute when you register the AMI.

- register-image (AWS CLI)

```
aws ec2 register-image --ena-support ...
```

- Register-EC2Image (AWS Tools for Windows PowerShell)

```
Register-EC2Image -EnaSupport $true ...
```

RHEL, SUSE, CentOS

The latest AMIs for Red Hat Enterprise Linux, SUSE Linux Enterprise Server, and CentOS include the kernel driver required for enhanced networking with ENA and have ENA support enabled. Therefore, if you launch an instance with the latest AMI on a supported instance type, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

The following procedure provides the general steps for enabling enhanced networking on a Linux distribution other than Amazon Linux AMI or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Clone the source code for the ena kernel driver on your instance from GitHub at https://github.com/amzn/amzn-drivers. (SUSE Linux Enterprise Server 12 SP2 and later include ENA 2.02 by default, so you are not required to download and compile the ENA driver. For SUSE Linux Enterprise Server 12 SP2 and later, you should file a request to add the driver version you want to the stock kernel).
3. Compile and install the ena kernel driver on your instance. These steps depend on the Linux distribution. For more information about compiling the kernel driver on Red Hat Enterprise

Linux, see How do I install the latest ENS driver for enhanced network support on an Amazon EC2 instance that runs RHEL?

4. Run the **sudo depmod** command to update kernel driver dependencies.
5. Update `initramfs` on your instance to ensure that the new kernel driver loads at boot time. For example, if your distribution supports **dracut**, you can use the following command.

```
dracut -f -v
```

6. Determine if your system uses predictable network interface names by default. Systems that use **systemd** or **udev** versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named `eth0`. This behavior can cause problems connecting to your instance. For more information and to see other configuration options, see Predictable Network Interface Names on the freedesktop.org website.

   a. You can check the **systemd** or **udev** versions on RPM-based systems with the following command.

```
rpm -qa | grep -e '^systemd-[0-9]\+\|^udev-[0-9]\+'
systemd-208-11.el7_0.2.x86_64
```

   In this Red Hat Enterprise Linux 7 example, the **systemd** version is 208, so predictable network interface names must be disabled.

   b. Disable predictable network interface names by adding the `net.ifnames=0` option to the `GRUB_CMDLINE_LINUX` line in `/etc/default/grub`.

```
sudo sed -i '/^GRUB\_CMDLINE\_LINUX/s/\"$/\ net\.ifnames\=0\"/' /etc/default/
grub
```

   c. Rebuild the grub configuration file.

```
sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI), Stop-EC2Instance (AWS Tools for Windows PowerShell).

[Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, proceed to this procedure: To enable enhanced networking on Linux (instance store–backed instances).

8. From your local computer, enable the enhanced networking `enaSupport` attribute using one of the following commands:

   - modify-instance-attribute (AWS CLI)

     ```
     aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --ena-support
     ```

   - Edit-EC2InstanceAttribute (Tools for Windows PowerShell)

     ```
     Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -EnaSupport $true
     ```

9. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking `enaSupport` attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

   If your instance operating system contains an `/etc/udev/rules.d/70-persistent-net.rules` file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and `eth0` might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).

11. (Optional) Connect to your instance and verify that the kernel driver is installed.

    If you are unable to connect to your instance after enabling enhanced networking, see Troubleshoot the ENA kernel driver on Linux.

To enable enhanced networking on Linux (instance store–backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an Amazon S3-backed AMI, making sure to enable the enhanced networking attribute when you register the AMI.

- register-image (AWS CLI)

```
aws ec2 register-image --ena-support ...
```

- Register-EC2Image (AWS Tools for Windows PowerShell)

```
Register-EC2Image -EnaSupport ...
```

Ubuntu with DKMS

This method is for testing and feedback purposes only. It is not intended for use with production deployments. For production deployments, see Ubuntu.

> **Important**
>
> Using DKMS voids the support agreement for your subscription. It should not be used for production deployments.

To enable enhanced networking with ENA on Ubuntu (EBS-backed instances)

1. Follow steps 1 and 2 in Ubuntu.
2. Install the `build-essential` packages to compile the kernel driver and the `dkms` package so that your `ena` kernel driver is rebuilt every time your kernel is updated.

```
ubuntu:~$ sudo apt-get install -y build-essential dkms
```

3. Clone the source for the `ena` kernel driver on your instance from GitHub at https://github.com/amzn/amzn-drivers.

```
ubuntu:~$ git clone https://github.com/amzn/amzn-drivers
```

4. Move the `amzn-drivers` package to the `/usr/src/` directory so DKMS can find it and build it for each kernel update. Append the version number (you can find the current version number in the release notes) of the source code to the directory name. For example, version `1.0.0` is shown in the following example.

```
ubuntu:~$ sudo mv amzn-drivers /usr/src/amzn-drivers-1.0.0
```

5. Create the DKMS configuration file with the following values, substituting your version of `ena`.

   Create the file.

```
ubuntu:~$ sudo touch /usr/src/amzn-drivers-1.0.0/dkms.conf
```

   Edit the file and add the following values.

```
ubuntu:~$ sudo vim /usr/src/amzn-drivers-1.0.0/dkms.conf
PACKAGE_NAME="ena"
PACKAGE_VERSION="1.0.0"
CLEAN="make -C kernel/linux/ena clean"
MAKE="make -C kernel/linux/ena/ BUILD_KERNEL=${kernelver}"
BUILT_MODULE_NAME[0]="ena"
BUILT_MODULE_LOCATION="kernel/linux/ena"
DEST_MODULE_LOCATION[0]="/updates"
DEST_MODULE_NAME[0]="ena"
AUTOINSTALL="yes"
```

6. Add, build, and install the `ena` kernel driver on your instance using DKMS.

   Add the kernel driver to DKMS.

```
ubuntu:~$ sudo dkms add -m amzn-drivers -v 1.0.0
```

   Build the kernel driver using the **dkms** command.

```
ubuntu:~$ sudo dkms build -m amzn-drivers -v 1.0.0
```

   Install the kernel driver using **dkms**.

```
ubuntu:~$ sudo dkms install -m amzn-drivers -v 1.0.0
```

7. Rebuild `initramfs` so the correct kernel driver is loaded at boot time.

```
ubuntu:~$ sudo update-initramfs -u -k all
```

8. Verify that the ena kernel driver is installed using the modinfo ena command from Test whether enhanced networking is enabled.

```
ubuntu:~$ modinfo ena
filename:    /lib/modules/3.13.0-74-generic/updates/dkms/ena.ko
version:  1.0.0

9. Continue with Step 3 in Ubuntu.

Enable enhanced networking on Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the `enaSupport` instance attribute to activate enhanced networking.

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and 2019 only] Run the following EC2Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -
Schedule
```

3. From the instance, install the driver as follows:

   a.

   b. Extract the zip archive.

   c. Install the driver by running the `install.ps1` PowerShell script.

   > **Note**
   >
   > If you get an execution policy error, set the policy to `Unrestricted` (by default it is set to `Restricted` or `RemoteSigned`). In a command line, run `Set-ExecutionPolicy -ExecutionPolicy Unrestricted`, and then run the `install.ps1` PowerShell script again.

4. From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI) or Stop-EC2Instance (AWS Tools for Windows PowerShell).
5. Enable ENA support on your instance as follows:

   a. From your local computer, check the EC2 instance ENA support attribute on your instance by running one of the following commands. If the attribute is not enabled, the output will be "[]" or blank. `EnaSupport` is set to `false` by default.

   - describe-instances (AWS CLI)

     ```
     aws ec2 describe-instances --instance-ids i-1234567890abcdef0 --query
      "Reservations[].Instances[].EnaSupport"
     ```

   - Get-EC2Instance (Tools for Windows PowerShell)

```
(Get-EC2Instance -InstanceId i-1234567890abcdef0).Instances.EnaSupport
```

b. To enable ENA support, run one of the following commands:

- modify-instance-attribute (AWS CLI)

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --ena-support
```

- Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -EnaSupport $true
```

If you encounter problems when you restart the instance, you can also disable ENA support using one of the following commands:

- modify-instance-attribute (AWS CLI)

```
aws ec2 modify-instance-attribute --instance-id i-1234567890abcdef0 --no-ena-support
```

- Edit-EC2InstanceAttribute (AWS Tools for Windows PowerShell)

```
Edit-EC2InstanceAttribute -InstanceId i-1234567890abcdef0 -EnaSupport $false
```

c. Verify that the attribute has been set to `true` using **describe-instances** or **Get-EC2Instance** as shown previously. You should now see the following output:

```
[
 true
]
```

6. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).
7. On the instance, validate that the ENA driver is installed and enabled as follows:

a. Open the context (right-click) menu for the network icon and choose **Open Network and Sharing Center**.

b. Choose the Ethernet adapter (for example, **Ethernet 2**).

c. Choose **Details**. For **Network Connection Details**, check that **Description** is **Amazon Elastic Network Adapter**.

8. (Optional) Create an AMI from the instance. The AMI inherits the `enaSupport` attribute from the instance. Therefore, you can use this AMI to launch another instance with ENA enabled by default.

ENA queues

Elastic Network Adapter (ENA) queues handle packet processing for your Amazon EC2 network interfaces. Each instance type has a set number of ENA queues shared across its Elastic Network Interfaces (ENIs). By default, each ENI gets a fixed queue count based on the instance type and size.

With configurable ENA queue allocation, you can choose how many queues each ENI gets. The total per ENI and per instance is still capped. This helps you match packet processing to your workload. For example, you can give more queues to an ENI with heavy traffic and fewer to one with light traffic.

Topics

- ENA queue specifications for EC2 instance types
- Configure ENA queue allocation

ENA queue specifications for EC2 instance types

The following tables list instance types that support configurable ENA queue allocation, along with their default and maximum queue values.

> **Note**
>
> For ENA queue values for all instance types, including types that do not support configurable ENA queue allocation, see the Network specifications tables in the *Amazon EC2 Instance Types* guide.

Note

* These instance types feature multiple network cards. Other instance types feature a single network card. For more information, see Network cards.

Configure ENA queue allocation

On supported instance types, you can configure the ENA queue count for each ENI. Use the AWS Management Console, AWS CLI, or PowerShell. In the AWS Management Console, this setting appears under each **Network interface**.

Note

Before you configure ENA queues, note the following requirements:

- Your instance must be stopped before you configure the number of ENA queues.
- The value for ENA queues must be a power of 2, such as 1, 2, 4, 8, 16, or 32.
- The number of queues on any single ENI cannot exceed the number of vCPUs on your instance.

Before you change the queue count, check your current count with the following command.

AWS CLI

```
aws ec2 describe-instances --instance-id i-1234567890abcdef0
```

PowerShell

```
(Get-EC2Instance -InstanceId i-1234567890abcdef0).Instances.NetworkInterfaces |
  Select-Object NetworkInterfaceId,
    @{N='DeviceIndex';E={$_.Attachment.DeviceIndex}},
    @{N='AttachmentId';E={$_.Attachment.AttachmentId}},
    @{N='EnaQueueCount';E={$_.Attachment.EnaQueueCount}}
```

Attach a network interface with ENA queues

In the following example, 16 ENA queues are configured on an ENI.

AWS CLI

To attach a network interface with ENA queues

Use the attach-network-interface command.

```
aws ec2 attach-network-interface \
  --network-interface-id eni-abcdef01234567890 \
  --instance-id i-1234567890abcdef0 \
  --device-index 1 \
  --ena-queue-count 16
```

PowerShell

To attach a network interface with ENA queues

Use the Add-EC2NetworkInterface cmdlet.

```
Add-EC2NetworkInterface `
  -NetworkInterfaceId eni-abcdef01234567890 `
  -InstanceId i-1234567890abcdef0 `
  -DeviceIndex 1 `
  -EnaQueueCount 16
```

Launch an instance with ENA queues

In the following example, 16 ENA queues each are configured on 3 ENIs.

AWS CLI

To launch an instance with ENA queues

Use the run-instances command.

```
aws ec2 run-instances \
  --image-id ami-1234567890abcdef0 \
  --instance-type c8i.4xlarge \
  --network-interfaces \
    "[{\"DeviceIndex\":0,\"SubnetId\":\"subnet-abcdef01234567890\",\"EnaQueueCount
\":16},
      {\"DeviceIndex\":1,\"SubnetId\":\"subnet-abcdef01234567890\",\"EnaQueueCount
\":16},
      {\"DeviceIndex\":2,\"SubnetId\":\"subnet-abcdef01234567890\",\"EnaQueueCount
\":16}]"
```

PowerShell

To launch an instance with ENA queues

Use the New-EC2Instance cmdlet.

```
New-EC2Instance `
  -ImageId ami-1234567890abcdef0 `
```

```
  -InstanceType c8i.4xlarge `
  -NetworkInterface @(
    @{DeviceIndex=0; SubnetId="subnet-abcdef01234567890"; EnaQueueCount=16},
    @{DeviceIndex=1; SubnetId="subnet-abcdef01234567890"; EnaQueueCount=16},
    @{DeviceIndex=2; SubnetId="subnet-abcdef01234567890"; EnaQueueCount=16}
  )
```

Modify ENA queues on an existing network interface

In the following example, 16 ENA queues are configured on an ENI.

AWS CLI

To modify ENA queues on a network interface

Use the modify-network-interface-attribute command.

```
aws ec2 modify-network-interface-attribute \
  --network-interface-id eni-1234567890abcdef0 \
  --attachment AttachmentId=eni-attach-1234567890abcdef0,EnaQueueCount=16
```

PowerShell

To modify ENA queues on a network interface

Use the Edit-EC2NetworkInterfaceAttribute cmdlet.

```
Edit-EC2NetworkInterfaceAttribute `
  -NetworkInterfaceId eni-1234567890abcdef0 `
  -Attachment_AttachmentId eni-attach-1234567890abcdef0 `
  -Attachment_EnaQueueCount 16
```

In the following example, the ENA count is reset to the default value.

AWS CLI

```
aws ec2 modify-network-interface-attribute \
  --network-interface-id eni-1234567890abcdef0 \
  --attachment AttachmentId=eni-attach-1234567890abcdef0,DefaultEnaQueueCount=true
```

PowerShell

```
Edit-EC2NetworkInterfaceAttribute `
  -NetworkInterfaceId eni-1234567890abcdef0 `
  -Attachment_AttachmentId eni-attach-1234567890abcdef0 `
  -Attachment_DefaultEnaQueueCount $true
```

Troubleshoot the ENA kernel driver on Linux

The Elastic Network Adapter (ENA) is designed to improve operating system health and reduce the chances of long-term disruption because of unexpected hardware behavior and or failures. The ENA architecture keeps device or driver failures as transparent to the system as possible. This topic provides troubleshooting information for ENA.

If you are unable to connect to your instance, start with the Troubleshoot connectivity issues section.

If you experience performance degradation after migrating to a sixth generation instance type, see the article What do I need to do before I migrate my EC2 instance to a sixth generation instance to make sure that I get maximum network performance?

If you are able to connect to your instance, you can gather diagnostic information by using the failure detection and recovery mechanisms that are covered in the later sections of this topic.

Contents

- Troubleshoot connectivity issues
- Keep-alive mechanism
- Register read timeout
- Statistics
- Driver error logs in syslog
- Sub-optimal configuration notifications

Troubleshoot connectivity issues

If you lose connectivity while enabling enhanced networking, the ena module might be incompatible with your instance's current running kernel. This can happen if you install the module

for a specific kernel version (without **dkms**, or with an improperly configured **dkms.conf** file) and then your instance kernel is updated. If the instance kernel that is loaded at boot time does not have the `ena` module properly installed, your instance will not recognize the network adapter and your instance becomes unreachable.

If you enable enhanced networking for a PV instance or AMI, this can also make your instance unreachable.

If your instance becomes unreachable after enabling enhanced networking with ENA, you can disable the `enaSupport` attribute for your instance and it will fall back to the stock network adapter.

To disable enhanced networking with ENA (EBS-backed instances)

1. From your local computer, stop the instance by using the Amazon EC2 console, the stop-instances command (AWS CLI), or the Stop-EC2Instance cmdlet (AWS Tools for PowerShell).
2. From your local computer, disable the enhanced networking attribute by using the modify-instance-attribute command with the `--no-ena-support` option or the Edit-EC2InstanceAttribute cmdlet with the `-EnaSupport $false` parameter.
3. From your local computer, start the instance using the Amazon EC2 console, the start-instances command, or the Start-EC2Instance cmdlet.
4. (Optional) Connect to your instance and try reinstalling the `ena` module with your current kernel version by following the steps in Enable enhanced networking with ENA on your EC2 instances.

To disable enhanced networking with ENA (instance store-backed instances)

1. Create a new AMI as described in Create an Amazon S3-backed AMI.
2. When you register the AMI, be sure to include the `--no-ena-support` option in the stop-instances command (AWS CLI) or the `-EnaSupport $false` parameter in the Register-EC2Image cmdlet.

Keep-alive mechanism

The ENA device posts keep-alive events at a fixed rate (usually once every second). The ENA driver implements a watchdog mechanism, which checks for the presence of these keep-alive messages.

If a message or messages are present, the watchdog is rearmed, otherwise the driver concludes that the device experienced a failure and then does the following:

- Dumps its current statistics to syslog
- Resets the ENA device
- Resets the ENA driver state

The above reset procedure may result in some traffic loss for a short period of time (TCP connections should be able to recover), but should not otherwise affect the user.

The ENA device may also indirectly request a device reset procedure, by not sending a keep-alive notification, for example, if the ENA device reaches an unknown state after loading an irrecoverable configuration.

The following is an example of the reset procedure:

```
[18509.800135] ena 0000:00:07.0 eth1: Keep alive watchdog timeout. // The watchdog
 process initiates a reset
[18509.815244] ena 0000:00:07.0 eth1: Trigger reset is on

```

Register read timeout

The ENA architecture suggests a limited usage of memory mapped I/O (MMIO) read operations. MMIO registers are accessed by the ENA device driver only during its initialization procedure.

If the driver logs (available in **dmesg** output) indicate failures of read operations, this may be caused by an incompatible or incorrectly compiled driver, a busy hardware device, or hardware failure.

Intermittent log entries that indicate failures on read operations should not be considered an issue; the driver will retry them in this case. However, a sequence of log entries containing read failures indicate a driver or hardware problem.

Below is an example of driver log entry indicating a read operation failure due to a timeout:

```
[ 47.113698] [ENA_COM: ena_com_reg_bar_read32] reading reg failed for timeout.
 expected: req id[1] offset[88] actual: req id[57006] offset[0]
[ 47.333715] [ENA_COM: ena_com_reg_bar_read32] reading reg failed for timeout.
 expected: req id[2] offset[8] actual: req id[57007] offset[0]
[ 47.346221] [ENA_COM: ena_com_dev_reset] Reg read32 timeout occurred
```

Statistics

If you experience insufficient network performance or latency issues, you should retrieve the device statistics and examine them. These statistics can be obtained using **ethtool** as follows.

```
[ec2-user ~]$ ethtool -S ethN
```

```
NIC statistics:
 tx_timeout: 0
 suspend: 0
 resume: 0
 wd_expired: 0
 interface_up: 1
 interface_down: 0
 admin_q_pause: 0
 bw_in_allowance_exceeded: 0
 bw_out_allowance_exceeded: 0
 pps_allowance_exceeded: 0
 conntrack_allowance_available: 450878
 conntrack_allowance_exceeded: 0
 linklocal_allowance_exceeded: 0
 queue_0_tx_cnt: 4329
 queue_0_tx_bytes: 1075749
 queue_0_tx_queue_stop: 0
 ...
```

The following command output parameters are described below:

`tx_timeout:` *N*

The number of times that the Netdev watchdog was activated.

`suspend:` *N*

The number of times the driver performed a suspend operation.

`resume:` *N*

The number of times the driver performed a resume operation.

`wd_expired:` *N*

The number of times that the driver did not receive the keep-alive event in the preceding three seconds.

`interface_up:` *N*

The number of times that the ENA interface was brought up.

`interface_down:` *N*

The number of times that the ENA interface was brought down.

`admin_q_pause: N`

The number of times the admin queue was not found in a running state.

`bw_in_allowance_exceeded: N`

The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.

`bw_out_allowance_exceeded: N`

The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.

`pps_allowance_exceeded: N`

The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance. *

`conntrack_allowance_available: N`

The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type. Only available for Nitro-based instances. Not supported with FreeBSD instances or DPDK environments.

`conntrack_allowance_exceeded: N`

The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.

`linklocal_allowance_exceeded: N`

The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the Amazon DNS service, the Instance Metadata Service, and the Amazon Time Sync Service, but does not impact traffic to custom DNS resolvers.

`queue_N_tx_cnt: N`

The number of transmitted packets for this queue.

`queue_N_tx_bytes: N`

The number of transmitted bytes for this queue.

`queue_N_tx_queue_stop: N`

The number of times that queue *N* was full and stopped.

`queue_N_tx_queue_wakeup: N`

The number of times that queue *N* resumed after being stopped.

`queue_N_tx_dma_mapping_err: N`

Direct memory access error count. If this value is not 0, it indicates low system resources.

`queue_N_tx_linearize: N`

The number of times SKB linearization was attempted for this queue.

`queue_N_tx_linearize_failed: N`

The number of times SKB linearization failed for this queue.

`queue_N_tx_napi_comp: N`

The number of times the `napi` handler called `napi_complete` for this queue.

`queue_N_tx_tx_poll: N`

The number of times the `napi` handler was scheduled for this queue.

`queue_N_tx_doorbells: N`

The number of transmission doorbells for this queue.

`queue_N_tx_prepare_ctx_err: N`

The number of times `ena_com_prepare_tx` failed for this queue.

`queue_N_tx_bad_req_id: N`

Invalid `req_id` for this queue. The valid `req_id` is zero, minus the `queue_size`, minus 1.

`queue_N_tx_llq_buffer_copy: N`

The number of packets whose headers size are larger than llq entry for this queue.

`queue_N_tx_missed_tx: N`

The number of packets that were left uncompleted for this queue.

`queue_N_tx_unmask_interrupt`: *N*

The number of times the tx interrupt was unmasked for this queue.

`queue_N_rx_cnt`: *N*

The number of received packets for this queue.

`queue_N_rx_bytes`: *N*

The number of received bytes for this queue.

`queue_N_rx_rx_copybreak_pkt`: *N*

The number of times the rx queue received a packet that is less than the rx_copybreak packet size for this queue.

`queue_N_rx_csum_good`: *N*

The number of times the rx queue received a packet where the checksum was checked and was correct for this queue.

`queue_N_rx_refil_partial`: *N*

The number of times the driver did not succeed in refilling the empty portion of the rx queue with the buffers for this queue. If this value is not zero, it indicates low memory resources.

`queue_N_rx_bad_csum`: *N*

The number of times the `rx` queue had a bad checksum for this queue (only if rx checksum offload is supported).

`queue_N_rx_page_alloc_fail`: *N*

The number of time that page allocation failed for this queue. If this value is not zero, it indicates low memory resources.

`queue_N_rx_skb_alloc_fail`: *N*

The number of time that SKB allocation failed for this queue. If this value is not zero, it indicates low system resources.

`queue_N_rx_dma_mapping_err`: *N*

Direct memory access error count. If this value is not 0, it indicates low system resources.

`queue_N_rx_bad_desc_num`: *N*

Too many buffers per packet. If this value is not 0, it indicates the use of very small buffers.

queue_*N*_rx_bad_req_id: *N*

The req_id for this queue is not valid. The valid req_id is from [0, queue_size - 1].

queue_*N*_rx_empty_rx_ring: *N*

The number of times the rx queue was empty for this queue.

queue_*N*_rx_csum_unchecked: *N*

The number of times the rx queue received a packet whose checksum wasn't checked for this queue.

queue_*N*_rx_xdp_aborted: *N*

The number of times that an XDP packet was classified as XDP_ABORT.

queue_*N*_rx_xdp_drop: *N*

The number of times that an XDP packet was classified as XDP_DROP.

queue_*N*_rx_xdp_pass: *N*

The number of times that an XDP packet was classified as XDP_PASS.

queue_*N*_rx_xdp_tx: *N*

The number of times that an XDP packet was classified as XDP_TX.

queue_*N*_rx_xdp_invalid: *N*

The number of times that the XDP return code for the packet was not valid.

queue_*N*_rx_xdp_redirect: *N*

The number of times that an XDP packet was classified as XDP_REDIRECT.

queue_*N*_xdp_tx_cnt: *N*

The number of transmitted packets for this queue.

queue_*N*_xdp_tx_bytes: *N*

The number of transmitted bytes for this queue.

queue_*N*_xdp_tx_queue_stop: *N*

The number of times that this queue was full and stopped.

queue_*N*_xdp_tx_queue_wakeup: *N*

The number of times that this queue resumed after being stopped.

queue_*N*_xdp_tx_dma_mapping_err: *N*

Direct memory access error count. If this value is not 0, it indicates low system resources.

queue_*N*_xdp_tx_linearize: *N*

The number of times XDP buffer linearization was attempted for this queue.

queue_*N*_xdp_tx_linearize_failed: *N*

The number of times XDP buffer linearization failed for this queue.

queue_*N*_xdp_tx_napi_comp: *N*

The number of times the napi handler called napi_complete for this queue.

queue_*N*_xdp_tx_tx_poll: *N*

The number of times the napi handler was scheduled for this queue.

queue_*N*_xdp_tx_doorbells: *N*

The number of transmission doorbells for this queue.

queue_*N*_xdp_tx_prepare_ctx_err: *N*

The number of times ena_com_prepare_tx failed for this queue. This value should always be zero; if not, see the driver logs.

queue_*N*_xdp_tx_bad_req_id: *N*

The req_id for this queue is not valid. The valid req_id is from [0, queue_size - 1].

queue_*N*_xdp_tx_llq_buffer_copy: *N*

The number of packets that had their headers copied using llq buffer copy for this queue.

queue_*N*_xdp_tx_missed_tx: *N*

The number of times a tx queue entry missed a completion timeout for this queue.

queue_*N*_xdp_tx_unmask_interrupt: *N*

The number of times the tx interrupt was unmasked for this queue.

`ena_admin_q_aborted_cmd: N`

The number of admin commands that were aborted. This usually happens during the auto-recovery procedure.

`ena_admin_q_submitted_cmd: N`

The number of admin queue doorbells.

`ena_admin_q_completed_cmd: N`

The number of admin queue completions.

`ena_admin_q_out_of_space: N`

The number of times that the driver tried to submit new admin command, but the queue was full.

`ena_admin_q_no_completion: N`

The number of times that the driver did not get an admin completion for a command.

Driver error logs in syslog

The ENA driver writes log messages to **syslog** during system boot. You can examine these logs to look for errors if you are experiencing issues. Below is an example of information logged by the ENA driver in **syslog** during system boot, along with some annotations for select messages.

```
Jun  3 22:37:46 ip-172-31-2-186 kernel: [  478.416939] [ENA_COM:

Which errors can I ignore?

The following warnings that may appear in your system's error logs can be ignored for the Elastic Network Adapter:

Set host attribute isn't supported

Host attributes are not supported for this device.

failed to alloc buffer for rx queue

This is a recoverable error, and it indicates that there may have been a memory pressure issue when the error was thrown.

Feature *X* isn't supported

The referenced feature is not supported by the Elastic Network Adapter. Possible values for *X* include:

- 10: RSS Hash function configuration is not supported for this device.
- 12: RSS Indirection table configuration is not supported for this device.
- 18: RSS Hash Input configuration is not supported for this device.
- 20: Interrupt moderation is not supported for this device.
- 27: The Elastic Network Adapter driver does not support polling the Ethernet capabilities from snmpd.

Failed to config AENQ

The Elastic Network Adapter does not support AENQ configuration.

Trying to set unsupported AENQ events

This error indicates an attempt to set an AENQ events group that is not supported by the Elastic Network Adapter.

Sub-optimal configuration notifications

The ENA device detects sub-optimal configuration settings in the driver that you can change. The device notifies the ENA driver and logs a warning to the console. The following example shows the format of the warning message.

```
Sub-optimal configuration notification code: 1. Refer to AWS ENA documentation for
 additional details and mitigation options.
```

The following list shows notification code details and recommended actions for sub-optimal configuration findings.

- **Code 1: ENA Express with wide LLQ configuration is not recommended**

  ENA Express ENI is configured with wide LLQ. This configuration is sub-optimal and could impact performance for ENA Express. We recommend that you disable wide LLQ settings when you use ENA Express ENIs as follows.

  ```
  sudo rmmod ena && sudo modprobe ena force_large_llq_header=0
  ```

  For more information about optimal configuration for ENA Express, see Improve network performance between EC2 instances with ENA Express.

- **Code 2: ENA Express ENI with sub-optimal Tx queue depth is not recommended**

  ENA Express ENI is configured with sub-optimal Tx queue depth. This configuration could impact performance for ENA Express. We recommend that you enlarge all Tx queues to the maximum value for the network interface when you use ENA Express ENIs as follows.

  You can run the following **ethtool** commands to adjust LLQ size. To learn more about how to control, query, and enable wide-LLQ, see the Large Low-Latency Queue (Large LLQ) topic of the Linux kernel driver for ENA documentation in the *Amazon Drivers GitHub repository*.

  ```
  ethtool -g interface
  ```

Set your Tx queues to the maximum depth:

```
ethtool -G interface tx depth
```

For more information about optimal configuration for ENA Express, see Improve network performance between EC2 instances with ENA Express.

- **Code 3: ENA with regular LLQ size and Tx packet traffic exceeds the maximum header supported size**

  By default, ENA LLQ supports Tx packet header size up to 96 bytes. If the packet header size is larger than 96 bytes, the packet is dropped. To mitigate this issue, we recommend that you enable wide-LLQ, which increases the supported Tx packet header size to a maximum of 224 bytes.

  However, when you enable wide-LLQ, the maximum Tx ring size is reduced from 1000 to 512 entries. Wide-LLQ is enabled by default for all Nitro v4 and later instance types.

  - Nitro v4 instance types have a default maximum wide-LLQ Tx ring size of 512 entries, which can't be changed.
  - Nitro v5 instance types have a default wide-LLQ Tx ring size of 512 entries, which you can increase up to 1000 entries.

  You can run the following **ethtool** commands to adjust LLQ size. To learn more about how to control, query, and enable wide-LLQ, see the Large Low-Latency Queue (Large LLQ) topic of the Linux kernel driver for ENA documentation in the *Amazon Drivers GitHub repository*.

  Find the maximum depth for your Tx queues:

  ```
  ethtool -g interface
  ```

  Set your Tx queues to the maximum depth:

  ```
  ethtool -G interface tx depth
  ```

Troubleshoot the Elastic Network Adapter Windows driver

The Elastic Network Adapter (ENA) is designed to improve operating system health and to reduce unexpected hardware behavior or failures that can disrupt the operation of your Windows instance. The ENA architecture keeps device or driver failures as transparent to the operating system as possible.

Collect diagnostic information on the instance

The steps to open Windows operating system (OS) tools vary, depending on what version of the OS is installed on your instance. In the following sections, we use the **Run** dialog to open the tools, which works the same across all OS versions. However, you can access these tools using any method that you prefer.

Access the Run dialog

- Using the Windows logo key combination: `Windows` + `R`
- Using the search bar:
  - Enter `run` in the search bar.
  - Select the **Run** application from the search results.

Some steps require the context menu to access properties or context-sensitive actions. There are several ways to do this, depending on your OS version and hardware.

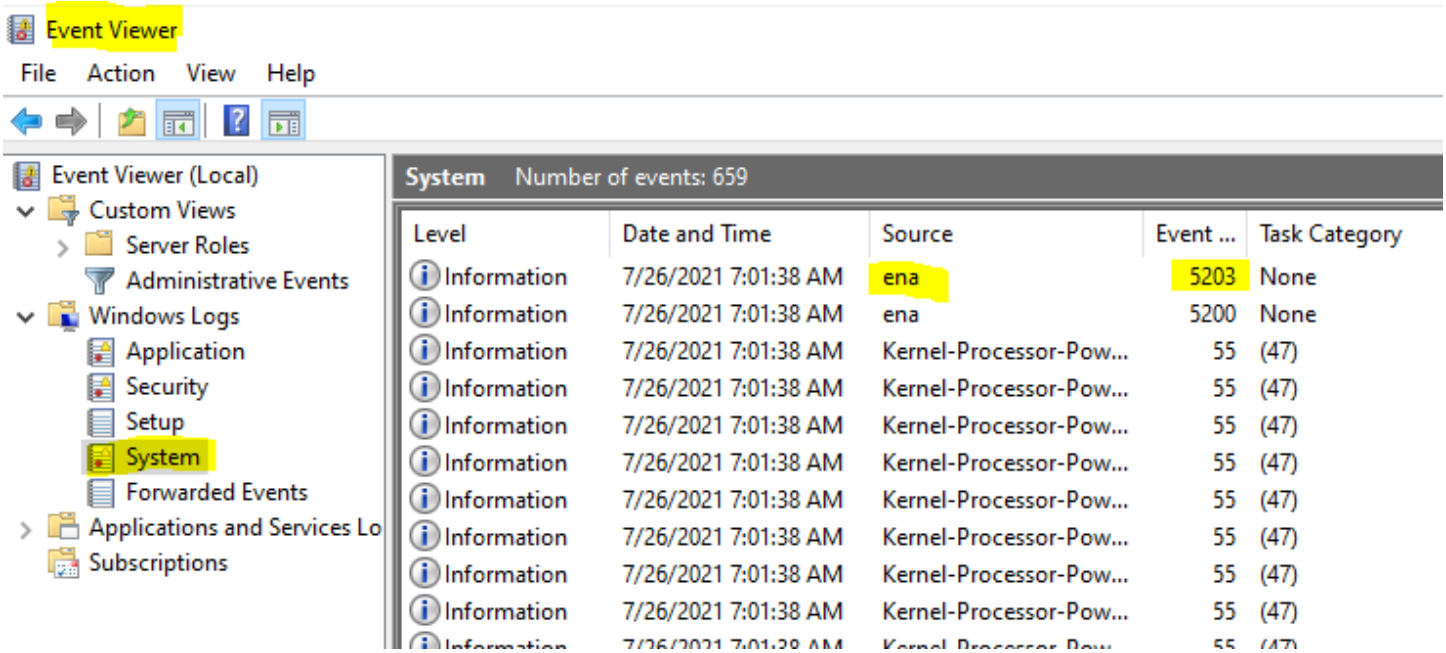
Access the context menu

- Using your mouse: right-click an item to bring up its context menu.
- Using your keyboard:
  - Depending on your OS version, use `Shift` + `F10`, or `Ctrl` + `Shift` + `F10`.
  - If you have the context key on your keyboard (three horizontal lines in a box), select the item you want and then press the context key.

If you can connect to your instance, use the following techniques to gather diagnostic information for troubleshooting.

Check ENA device status

To check the status of your ENA Windows driver using the Windows Device Manager, follow these steps:



1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. Verify that the message in the **General** tab says "This device is working properly."

Investigate driver event messages

To review ENA Windows driver event logs using the Windows Event Viewer, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Event Viewer, enter `eventvwr.msc` in the **Run** box.
3. Choose **OK**. This opens the Event Viewer window.
4. Expand the **Windows Logs** menu, and then choose **System**.
5. Under **Actions**, in the top-right panel, choose **Filter Current Log**. This displays the filtering dialog.
6. In the **Event sources** box, enter `ena`. This limits results to events that were generated by the ENA Windows driver.
7. Choose **OK**. This shows filtered event log results in the detail sections of the window.
8. To drill down into the details, select an event message from the list.

The following example shows an ENA driver event in the Windows Event Viewer system events list:

Event message summary

The following table shows event messages that the ENA Windows driver generates.

Input

Event ID	ENA driver event description	Type
5001	Hardware is out of resources	Error
5002	Adapter has detected a hardware error	Error
5005	Adapter has timed out on NDIS operation that did not complete in a timely manner	Error
5032	Adapter has failed to reset the device	Error
5200	Adapter has been initialized	Informational
5201	Adapter has been halted	Informational
5202	Adapter has been paused	Informational

Event ID	ENA driver event description	Type
5203	Adapter has been restarted	Informational
5204	Adapter has been shut down	Informational
5205	Adapter has been reset	Error
5206	Adapter has been surprise removed	Error
5208	Adapter initialization routine has failed	Error
5210	Adapter has encountered and successfully recovered an internal issue	Error

Review performance metrics

The ENA Windows driver publishes network performance metrics from the instances where metrics are enabled. You can view and enable metrics on the instance using the native Performance Monitor application. For more information about the metrics that the ENA Windows driver produces, see Monitor network performance for ENA settings on your EC2 instance.

On instances where ENA metrics are enabled, and the Amazon CloudWatch agent is installed, CloudWatch collects the metrics that are associated with the counters in Windows Performance Monitor, as well as some advanced metrics for ENA. These metrics are collected in addition to the metrics enabled by default on EC2 instances. For more information about the metrics, see Metrics collected by the CloudWatch agent in the *Amazon CloudWatch User Guide*.

> **Note**
>
> Performance metrics are available for ENA driver versions 2.4.0 and later (also for version 2.2.3). ENA driver version 2.2.4 was rolled back due to potential performance degradation on the sixth generation EC2 instances. We recommend that you upgrade to the current version of the driver to ensure that you have the latest updates.

Some of the ways that you can use performance metrics include:

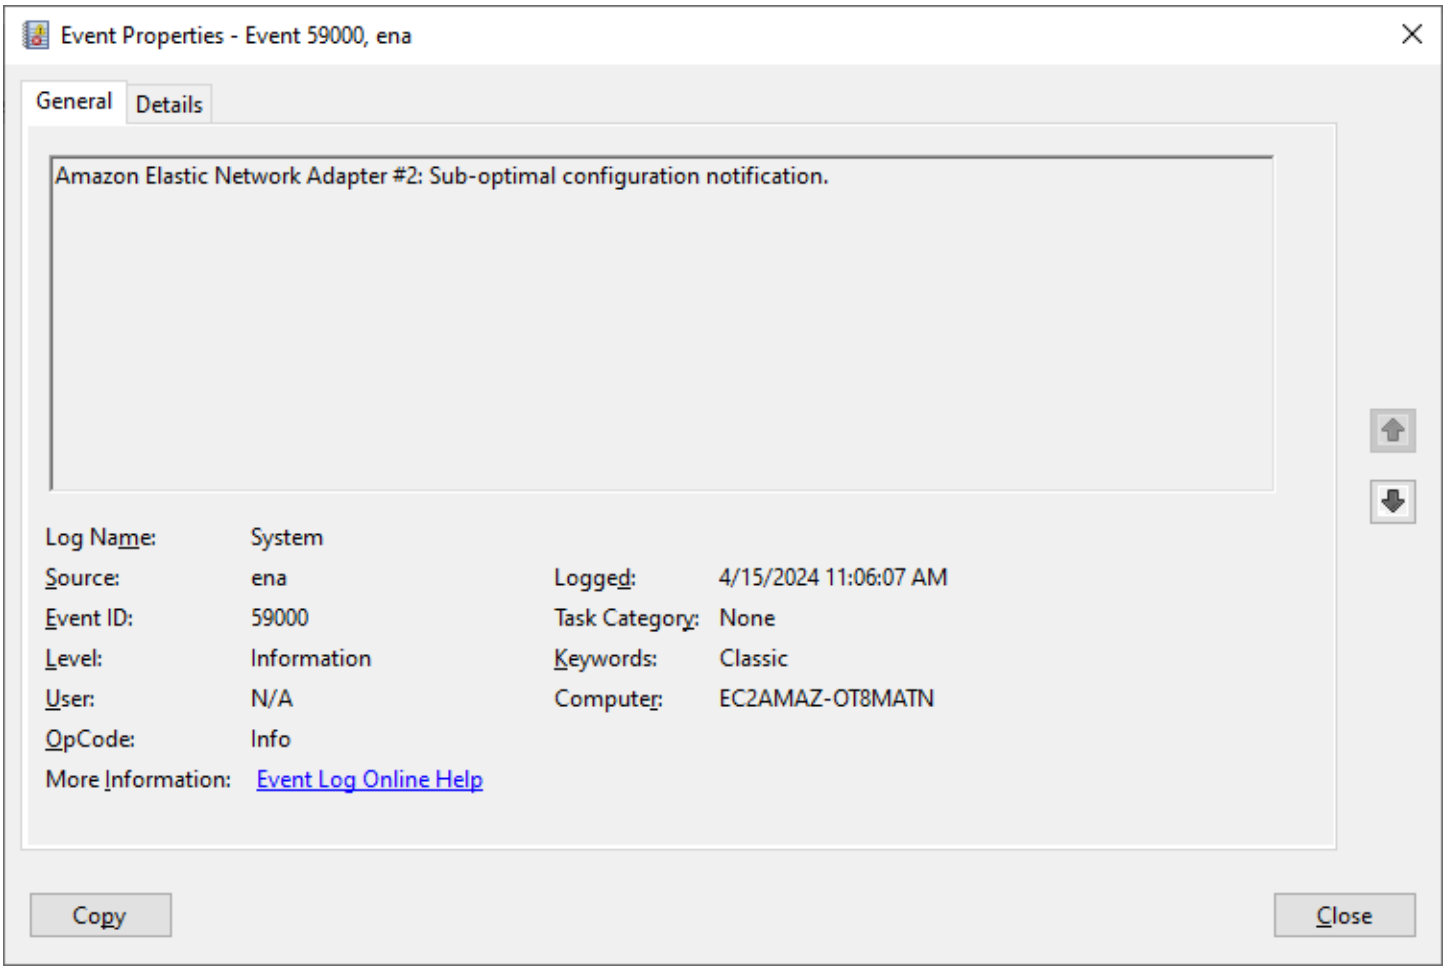
- Troubleshoot instance performance issues.
- Choose the right instance size for a workload.
- Proactively plan scaling activities.
- Benchmark applications to determine if they maximize the performance available on an instance.

Refresh rate

By default, the driver refreshes metrics using a 1-second interval. However, the application that retrieves the metrics might use a different interval for polling. You can change the refresh interval in Device Manager, using the advanced properties for the driver.

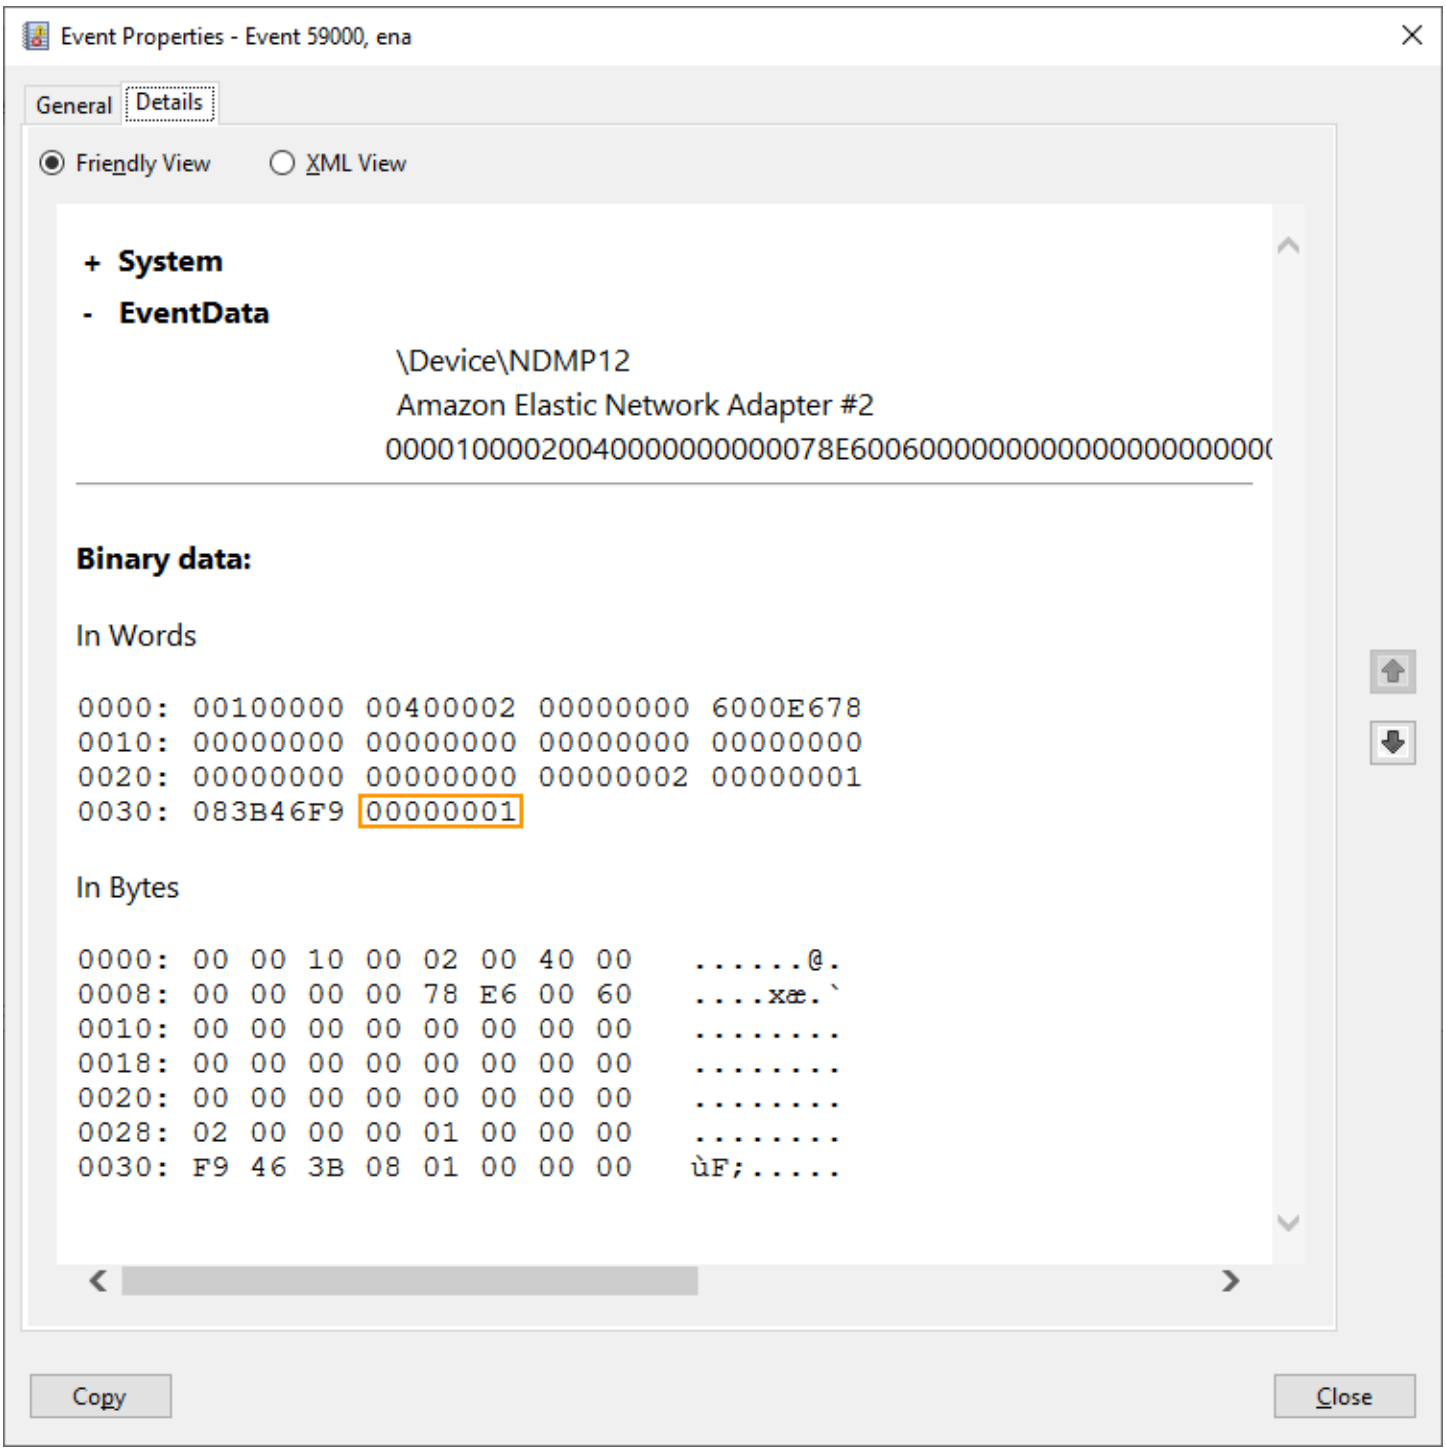
To change the metrics refresh interval for the ENA Windows driver, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. Open the **Advanced** tab in the pop-up window.
7. From the **Property** list, choose **Metrics Refresh Interval** to change the value.
8. When you are done, choose **OK**.



Investigate sub-optimal configuration notifications

The ENA device detects sub-optimal configuration settings in the driver that you can change. The device notifies the ENA driver and logs an event notification. To review sub-optimal events in the Windows Event Viewer



1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Event Viewer, enter `eventvwr.msc` in the **Run** box.
3. Choose **OK**. This opens the Event Viewer window.
4. Expand the **Windows Logs** menu, and then choose **System**.

5. Under **Actions**, in the top-right panel, choose **Filter Current Log**. This displays the filtering dialog.
6. In the **Event sources** box, enter `ena`. This limits results to events that were generated by the ENA Windows driver.
7. Choose **OK**. This shows filtered event log results in the detail sections of the window.

Events with ID `59000` notify you of sub-optimal configuration findings. Open the context (right-click) menu for an event and choose **Event Properties** to open a detailed view, or select **Preview Pane** from the **View** menu to see the same detail.

Open the **Details** tab to see the event code. In the **Binary Data: In words** section, the last word is the code.

The following list shows notification code details and recommended actions for sub-optimal configuration findings.

- **Code 1: ENA Express with wide LLQ configuration is not recommended**

ENA Express ENI is configured with wide LLQ. This configuration is sub-optimal and could impact performance for ENA Express. We recommend that you disable wide LLQ settings when you use ENA Express ENIs as follows.

1. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
2. Choose **OK**. This opens the Device Manager window.
3. Select the arrow to the left of **Network adapters** to expand the list.
4. Open the device properties for the `Amazon Elastic Network Adapter`.
5. From there, open the **Advanced** tab to make your changes.
6. Select the **LLQ Header Size Policy** property, and set its value to `Normal (128 Bytes)`.
7. Choose **OK** to save your changes.

- **Code 2: ENA Express ENI with sub-optimal Tx queue depth is not recommended**

  ENA Express ENI is configured with sub-optimal Tx queue depth. This configuration could impact performance for ENA Express. We recommend that you enlarge all Tx queues to the maximum value for the network interface when you use ENA Express ENIs as follows.

  Follow these steps to enlarge the Tx queues to the maximum depth:

  1. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
  2. Choose **OK**. This opens the Device Manager window.
  3. Select the arrow to the left of **Network adapters** to expand the list.
  4. Open the device properties for the `Amazon Elastic Network Adapter`.
  5. From there, open the **Advanced** tab to make your changes.
  6. Select the **Transmit Buffers** property, and set its value to the maximum supported.
  7. Choose **OK** to save your changes.

ENA adapter reset

The reset process starts when the ENA Windows driver detects an error on an adapter, and marks the adapter as unhealthy. The driver cannot reset itself, so it depends on the operating system to check the adapter health status, and call the reset handle for the ENA Windows driver. The reset process might result in a brief period of time where traffic loss occurs. However, TCP connections should be able to recover.

The ENA adapter might also indirectly request a device reset procedure, by failing to send a keep-alive notification. For example, if the ENA adapter reaches an unknown state after loading an irrecoverable configuration, it might stop sending keep-alive notifications.

Common causes for ENA adapter reset

- Keep-alive messages are missing

  The ENA adapter posts keep-alive events at a fixed rate (usually once every second). The ENA Windows driver implements a watchdog mechanism, which periodically checks for the presence of these keep-alive messages. If it detects one or more new messages since the last time it checked, it records a successful outcome. Otherwise, the driver concludes that the device experienced a failure, and initiates a reset sequence.

- Packets are stuck in transmit queues

  The ENA adapter verifies that packets are flowing through the transmit queues as expected. The ENA Windows driver detects if packets are getting stuck, and initiates a reset sequence if they are.

- Read timeout for Memory Mapped I/O (MMIO) registers

  To limit memory mapped I/O (MMIO) read operations, the ENA Windows driver accesses MMIO registers only during initialization and reset processes. If the driver detects a timeout, it takes one of the following actions, depending on what process was running:

  - If a timeout is detected during initialization, it fails the flow, which results in the driver displaying a yellow exclamation mark by the ENA adapter in Windows Device Manager.
  - If a timeout is detected during reset, it fails the flow. The OS then initiates a surprise removal of the ENA adapter, and recovers it by stopping and starting the adapter that was removed. For more information about surprise removal of a network interface card (NIC), see Handling the Surprise Removal of a NIC in the *Microsoft Windows Hardware Developer* documentation.

Troubleshooting scenarios

The following scenarios can help you troubleshoot issues that you might experience with the ENA Windows driver. We recommend that you start with upgrading your ENA driver, if you don't have the latest version. To find the latest driver for your Windows OS version, see Track ENA Windows driver version releases.

Unexpected ENA driver version installed

Description

After you go through the steps to install a specific version of the ENA driver, the Windows Device Manager shows that Windows installed a different version of the ENA driver.

Cause

When you run the install for a driver package, Windows ranks all of the driver packages that are valid for the given device in the local Driver Store before it begins. Then it selects the package with the lowest rank value as the best match. This can be different from the package that you intended to install. For more information about the device driver package selection process, see How Windows selects a driver package for a device on the *Microsoft documentation website*.

Solution

To ensure that Windows installs your chosen driver package version, you can remove lower ranked driver packages from the Driver Store with the PnPUtil command line tool.

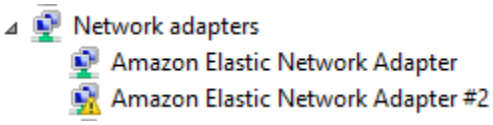
Follow these steps to update the ENA driver:

1. Connect to your instance and log in as the local administrator.
2. Open the Device Manager properties window, as described in the Check ENA device status section. This opens the **General** tab of the **Amazon Elastic Network Adapter Properties** window.
3. Open the **Driver** tab.
4. Choose **Update Driver**. This opens the **Update Driver Software – Amazon Elastic Network Adapter** dialog box.
    a. On the **How do you want to search for driver software?** page, choose **Browse my computer for driver software**.
    b. On the **Browse for driver software on your computer** page, choose **Let me pick from a list of device drivers on my computer**, located below the search bar.
    c. On the **Select the device driver you want to install for this hardware** page, choose **Have Disk...**.
    d. In the **Install from Disk** window, choose **Browse...**, next to the file location from the dropdown list.

e. Navigate to the location where you downloaded the target ENA driver package. Select the file named `ena.inf` and choose **Open**.

f. To start the install, choose **OK**, and then choose **Next**.

5. If the installer doesn't automatically reboot your instance, run the **Restart-Computer** PowerShell cmdlet.



```
PS C:\> Restart-Computer
```

Device warning for ENA driver

Description

The ENA adapter icon in the Device Manager **Network adapters** section displays a warning sign (a yellow triangle with an exclamation mark inside).

The following example shows an ENA adapter with the warning icon in Windows Device Manager:

Cause

This device warning is commonly caused by environment issues, which might require more research, and often require a process of elimination to determine the underlying cause. For a full list of device errors, see Device Manager Error Messages in the Microsoft documentation.

Solution

The solution for this device warning depends on the root cause. The process of elimination described here includes a few basic steps to help identify and resolve the most common issues that might have a simple solution. Additional root cause analysis is required when these steps do not resolve the issue.

Follow these steps to help identify and resolve common issues:

1. **Stop and start the device**

   Open the Device Manager properties window, as described in the Check ENA device status section. This opens the **General** tab of the **Amazon Elastic Network Adapter Properties** window, where the **Device status** displays the error code and a short message.

a. Open the **Driver** tab.

b. Choose **Disable Device**, and respond **Yes** to the warning message that displays.

c. Choose **Enable Device**.

2. **Stop and start the EC2 instance**

   If the adapter still shows the warning icon in Device Manager, the next step is to stop and start the EC2 instance. This relaunches the instance on different hardware in most cases.

3. **Investigate possible instance resource issue**

   If you have stopped and started your EC2 instance, and the problem persists, this might indicate a resource issue on your instance, such as insufficient memory.

Connection timeout with adapter reset (error codes 5007, 5205)

Description

The Windows Event Viewer shows adapter timeout and reset events occurring in combination for ENA adapters. Messages resemble the following examples:

- **Event ID 5007**: Amazon Elastic Network Adapter : Timed out during an operation.
- **Event ID 5205**: Amazon Elastic Network Adapter : Adapter reset has been started.

Adapter resets cause minimal traffic disruption. Even when there are multiple resets, it would be unusual for them to cause any severe network disruption.

Cause

This sequence of events indicates that the ENA Windows driver initiated a reset for an ENA adapter that was unresponsive. However, the mechanism that the device driver uses to detect this issue is subject to false positives resulting from CPU 0 starvation.

Solution

If this combination of errors happens frequently, check your resource allocations to see where adjustments might be helpful.

1. Open the **Run** dialog using one of the methods described in the preceding section.

2. To open the Windows Resource Monitor, enter `resmon` in the **Run** box.
3. Choose **OK**. This opens the Resource Monitor window.
4. Open the **CPU** tab. Per-CPU usage graphs are shown along the right side of the Resource Monitor window.
5. Check the usage levels for CPU 0 to see if they are too high.

We recommend that you configure RSS to exclude CPU 0 for the ENA adapter on larger instance types (more than 16 vCPU). For smaller instance types, configuring RSS might improve the experience, but due to the lower number of available cores, testing is necessary to ensure that constraining CPU cores does not negatively impact performance.

Use the **Set-NetAdapterRss** command to configure RSS for your ENA adapter, as shown in the following example.

```
Set-NetAdapterRss -name (Get-NetAdapter | Where-Object {$_.InterfaceDescription -like
 "*Elastic*"}).Name -Baseprocessorgroup 0 -BaseProcessorNumber 1
```

Migrating to a sixth generation instance infrastructure impacts performance or attachment

Description

If you migrate to a sixth generation EC2 instance, you might experience reduced performance or ENA attachment failures if you haven't updated your ENA Windows driver version.

Cause

The sixth generation EC2 instance types require the following minimum version of the ENA Windows driver, based on the instance operating system (OS).

Minimum version

Windows Server version	ENA driver version
Windows Server 2008 R2	2.2.3 or 2.4.0
Windows Server 2012 and later	2.2.3 and later

Windows Server version	ENA driver version
Windows Workstation	2.2.3 and later

Solution

Before you upgrade to a sixth generation EC2 instance, make sure that the AMI you launch from has compatible drivers based on the instance OS as shown in the previous table. For more information, see What do I need to do before migrating my EC2 instance to a sixth generation instance to make sure that I get maximum network performance? in the *AWS re:Post Knowledge Center*.

Suboptimal performance for the elastic network interface

Description

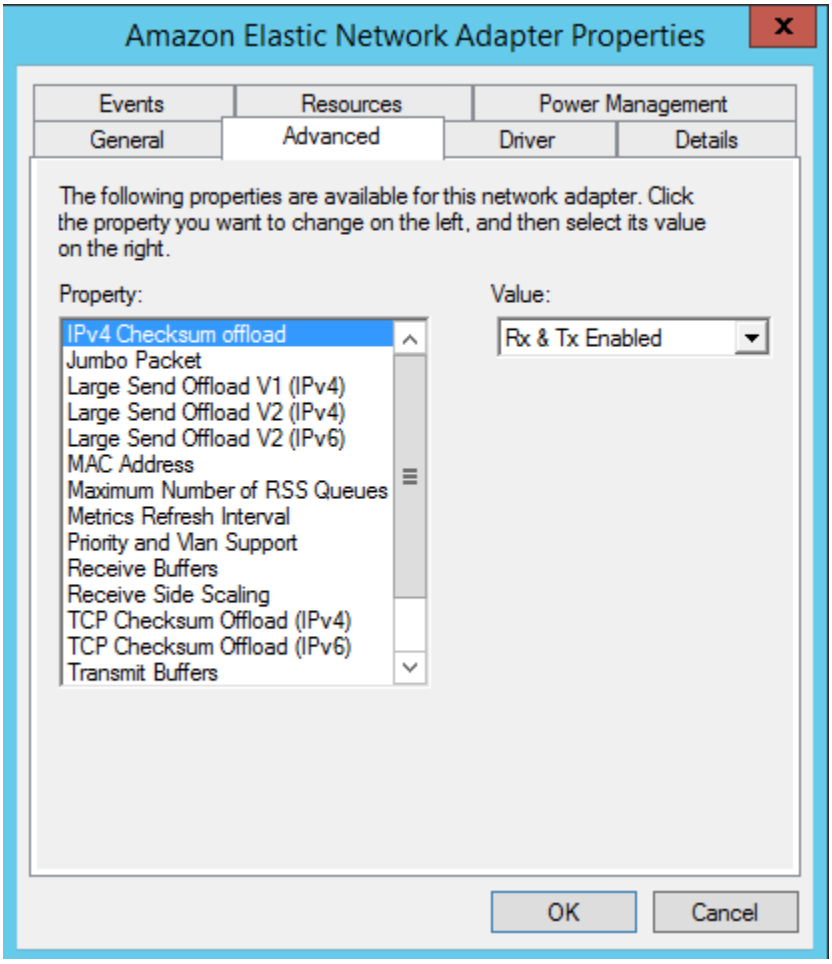
The ENA interface is not performing as expected.

Cause

Root cause analysis for performance issues is a process of elimination. There are too many variables involved to name a common cause.

Solution

The first step in your root cause analysis is to review the diagnostic information for the instance that is not performing as expected, to determine if there are errors that might be causing the issue. For more information, see the Collect diagnostic information on the instance section.



You might need to modify the default operating system configuration to achieve maximum network performance on instances with enhanced networking. Some optimizations, such as turning on checksum offloading and enabling RSS, are configured by default in official Windows AMIs. For other optimizations that you can apply to the ENA adapter, see the performance adjustments shown in ENA adapter performance adjustments.

We recommend that you proceed with caution, and limit device property adjustments to those that are listed in this section, or to specific changes that are recommended by the AWS support team.

To change ENA adapter properties, follow these steps:

1. Open the **Run** dialog using one of the methods described in the preceding section.
2. To open the Windows Device Manager, enter `devmgmt.msc` in the **Run** box.
3. Choose **OK**. This opens the Device Manager window.
4. Select the arrow to the left of **Network adapters** to expand the list.
5. Choose the name, or open the context menu for the **Amazon Elastic Network Adapter**, and then choose **Properties**. This opens the **Amazon Elastic Network Adapter Properties** dialog.
6. To make your changes, open the **Advanced** tab.
7. When you're done, choose **OK** to save your changes.

The following example shows an ENA adapter property in the Windows Device Manager:

ENA adapter performance adjustments

The following table includes properties that can be adjusted to improve performance for the ENA interface.

Input

Property	Description	Default value	Adjustment
Receive Buffers	Controls the number of entries in the software receive queues.	1024	Can be increased up to a maximum of 8192.
Receive Side Scaling (RSS)	Enables the efficient distribution of network receive processing across multiple CPUs in multiprocessor systems.	Enabled	You can spread the load across multiple processors. To learn more, see Optimize network performance on EC2 Windows instances.
Maximum Number of RSS Queues	Sets the maximum number of RSS queues allowed when RSS is enabled.	32	The number of RSS queues is determined during driver initialization, and includes the following limitations (among others): • RSS queue limit set by this property • Instance limits (vCPU count) • Hardware generation limits (up to 8 RSS queues in ENAv1,

Property	Description	Default value	Adjustment
			and up to 32 RSS queues in ENAv2) You can set the value from 1-32, depending on your instance and hardw are generation limits. To learn more, see Optimize network performance on EC2 Windows instances.
Jumbo packet	Enables the use of jumbo ethernet frames (more than 1500 bytes of payload).	Disabled (this limits payload to 1500 bytes or less)	Value can be set up to 9015, which translates to 9001 bytes of payload. This is the maximum payload for jumbo ethernet frames. See Considerations for using jumbo ethernet frames.

Considerations for using jumbo ethernet frames

Jumbo frames allow more than 1500 bytes of data by increasing the payload size per packet, which increases the percentage of the packet that is not packet overhead. Fewer packets are needed to send the same amount of usable data. However, traffic is limited to a maximum MTU of 1500 in the following cases:

- Traffic outside of a given AWS Region for EC2 Classic.
- Traffic outside of a single VPC.

- Traffic over an inter-Region VPC peering connection.
- Traffic over VPN connections.
- Traffic over an internet gateway.

> **Note**
>
> Packets over 1500 bytes are fragmented. If you have the `Don't Fragment` flag set in the IP header, these packets are dropped.
> Jumbo frames should be used with caution for internet-bound traffic, or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside of a VPC without impacting outbound traffic that's leaving the VPC, try one of the following options:
>
> - Configure the MTU size by route.
> - Use multiple network interfaces with different MTU sizes and different routes.

Recommended use cases for jumbo frames

Jumbo frames can be useful for traffic inside of and between VPCs. We recommend using jumbo frames for the following use cases:

- For instances that are collocated inside of a cluster placement group, jumbo frames help to achieve the maximum network throughput possible. For more information, see Placement groups for your Amazon EC2 instances.
- You can use jumbo frames for traffic between your VPCs and your on-premises networks over Direct Connect. For more information about using Direct Connect, and verifying jumbo frame capability, see MTU for private virtual interfaces or transit virtual interfaces in the *Direct Connect User Guide*.
- For more information about supported MTU sizes for transit gateways, see Quotas for your transit gateways in the *Amazon VPC Transit Gateways*.

Improve network performance between EC2 instances with ENA Express

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. With ENA Express, you can communicate between two EC2 instances in the same Availability Zone or across Availability Zones within the same Region.

Benefits of ENA Express

- Increases the maximum bandwidth a single flow can use from 5 Gbps up to 25 Gbps within the same Region, up to the aggregate instance limit.
- Reduces tail latency of network traffic between EC2 instances in the same Availability Zone, especially during periods of high network load.
- Detects and avoids congested network paths.
- Handles some tasks directly in the network layer, such as packet reordering on the receiving end, and most retransmits that are needed. This frees up the application layer for other work.

Note

- If your application has high packets-per-second requirements and needs to optimize for latency during uncongested periods, Enhanced networking might be a better fit.
- ENA Express traffic can't be sent in a Local Zone.
- ENA Express support for traffic between Availability Zones is not available in South America (São Paulo), Middle East (Bahrain), and Middle East (UAE).

After you've enabled ENA Express for the network interface attachment on an instance, the sending instance initiates communication with the receiving instance, and SRD detects if ENA Express is operating on both the sending instance and the receiving instance. If ENA Express is operating, the communication can use SRD transmission. If ENA Express is not operating, the communication falls back to standard ENA transmission.

During periods of time when network traffic is light, you might notice a slight increase in median packet latency (tens of microseconds) when the packet uses ENA Express. During those times,

applications that prioritize specific network performance characteristics can benefit from ENA Express as follows:

- Processes can benefit from increased maximum single flow bandwidth from 5 Gbps up to 25 Gbps within the same Region, up to the aggregate instance limit. For example, if a specific instance type supports up to 12.5 Gbps, the single flow bandwidth is also limited to 12.5 Gbps.
- Longer running processes in the same Availability Zone will experience reduced tail latency during periods of network congestion.
- Processes can benefit from a smoother and more standard distribution for network response times.

Topics

- How ENA Express works
- Supported instance types for ENA Express
- Tune performance for ENA Express settings on Linux instances
- Review ENA Express settings for your EC2 instance
- Configure ENA Express settings for your EC2 instance

How ENA Express works

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. It distributes packets for each network flow across different AWS network paths, and dynamically adjusts distribution when it detects signs of congestion. It also manages packet reordering on the receiving end.

To ensure that ENA Express can manage network traffic as intended, sending and receiving instances and the communication between them must meet all of the following requirements:

- Both sending and receiving instance types are supported. See the Supported instance types for ENA Express table for more information.
- Both sending and receiving instances must have ENA Express configured. If there are differences in the configuration, you can run into situations where traffic defaults to standard ENA transmission. The following scenario shows what can happen.

  Scenario: Differences in configuration

Instance	ENA Express Enabled	UDP uses ENA Express
Instance 1	Yes	Yes
Instance 2	Yes	No

In this case, TCP traffic between the two instances can use ENA Express, as both instances have enabled it. However, since one of the instances does not use ENA Express for UDP traffic, communication between these two instances over UDP uses standard ENA transmission.

- The sending and receiving instances must run in the same Region.
- The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.
- (Linux instances only) To utilize full bandwidth potential, use driver version 2.2.9 or higher.
- (Linux instances only) To produce metrics, use driver version 2.8 or higher.

If any requirement is unmet, the instances use the standard TCP/UDP protocol but without SRD to communicate.

To ensure that your instance network driver is configured for optimum performance, review the recommended best practices for ENA drivers. These best practices apply to ENA Express, as well. For more information, see the ENA Linux Driver Best Practices and Performance Optimization Guide on the GitHub website.

Note

Amazon EC2 refers to the relationship between an instance and a network interface that's attached to it as an *attachment*. ENA Express settings apply to the attachment. If the network interface is detached from the instance, the attachment no longer exists, and the ENA Express settings that applied to it are no longer in force. The same is true when an instance is terminated, even if the network interface remains.

After you've enabled ENA Express for the network interface attachments on both the sending instance and the receiving instance, you can use ENA Express metrics to help ensure that your

instances take full advantage of the performance improvements that SRD technology provides. For more information about ENA Express metrics, see Metrics for ENA Express.

Supported instance types for ENA Express

The following instance types support ENA Express.

General purpose

Instance type	Architecture
m6a.12xlarge	x86_64

Tune performance for ENA Express settings on Linux instances

To ensure that ENA Express can operate effectively, your Linux instance must meet several network configuration requirements.

Rather than configuring each setting manually, you can download and run the ENA Express settings check script from the Amazon GitHub repository. The script validates your instance against the required and recommended settings for ENA Express, and outputs the exact commands to fix any issues it finds.

https://github.com/amzn/amzn-ec2-ena-utilities/blob/main/ena-express/check-ena-express-settings.sh

The script checks the following settings and configurations:

- **MTU size** – ENA Express requires a lower MTU than the default to accommodate additional AWS SRD headers. Newly established TCP connections automatically clamp the MSS to mitigate this, but UDP traffic still requires a lower MTU.
- **TCP output queue size limit** – Checks that the per-socket in-flight byte limit is sufficient to sustain high throughput. Environments with increased network latency require a higher limit.

- **Byte queue limit** – Confirms that the byte queue limit (BQL) is disabled on the network interface. BQL can restrict the amount of data queued for device-level transmission, which limits ENA Express performance.

  > **Note**
  >
  > The ENA driver for the Amazon Linux distribution disables byte queue limits by default.

- **TCP autocorking** – Checks whether TCP autocorking is disabled. Disabling autocorking can reduce latency for certain ENA Express TCP traffic patterns, such as request-response workloads. This might result in a minimal increase in packet processing overhead.
- **TX queue size and Large LLQ** – Verifies that the transmit queue size for the network interface is large enough for optimal performance. The script also checks whether the ENA module parameter explicitly disables the Large Low Latency Queue (Large LLQ) feature, as it can reduce the available TX queue depth. For more information about Large LLQ and its impact on TX queue size, see Large Low Latency Queue (Large LLQ) on GitHub.
- **RX queue size** – Checks that the receive ring buffer for the network interface is large enough to handle incoming traffic efficiently and avoid packet drops under load.
- **TCP and network socket buffer sizes** – Validates that the TCP receive and send buffer maximum sizes, as well as the core network socket buffer defaults and maximums, are large enough to sustain high throughput. These settings are important in environments with increased network latency, where you need larger buffers to use the connection.
- **TCP congestion control** – Verifies that the TCP congestion control configuration is optimized for use with ENA Express in environments with increased network latency.

The script also reports additional diagnostic information, including the ENA driver version, ENA SRD statistics, interrupt moderation settings, queue configuration, and socket buffer sizes. This information can be useful for troubleshooting ENA Express performance issues.

To ensure that your instance network driver is configured for optimum performance, also review the ENA Linux Driver Best Practices and Performance Optimization Guide on GitHub.

Review ENA Express settings for your EC2 instance

You can verify the ENA Express settings by instance or by network interface. To update the ENA Express settings, see the section called “Configure instance settings”.

Console

To view ENA Express settings for a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface to see the details for that instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interface attachment** section on the **Details** tab or detail page, review settings for **ENA Express** and **ENA Express UDP**.

To view ENA Express settings for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Instances**.
3. Select an instance to see the details for that instance. You can choose the **Instance ID** link to open the detail page, or you can select the checkbox on the left side of the list to view details in the detail pane at the bottom of the page.
4. In the **Network interfaces** section on the **Networking** tab, scroll right to review settings for **ENA Express** and **ENA Express UDP**.

AWS CLI

To get the ENA Express settings for an instance

Use the describe-instances command. This command example returns a list of ENA Express configurations for the network interfaces attached to each of the running instances that are specified by the `--instance-ids` parameter.

```
aws ec2 describe-instances \
    --instance-ids i-1234567890abcdef0 i-0598c7d356eba48d7 \
    --query 'Reservations[*].Instances[*].[InstanceId,
 NetworkInterfaces[*].Attachment.EnaSrdSpecification]'
```

The following is example output.

```
[
```

```
    [
        [
            "i-1234567890abcdef0",
            [
                {
                    "EnaSrdEnabled": true,
                    "EnaSrdUdpSpecification": {
                        "EnaSrdUdpEnabled": false
                    }
                }
            ]
        ]
    ],
    [
        [
            "i-0598c7d356eba48d7",
            [
            {
                    "EnaSrdEnabled": true,
                    "EnaSrdUdpSpecification": {
                        "EnaSrdUdpEnabled": false
                    }
                }
            ]
        ]
    ]
]
```

To get the ENA Express settings for a network interface

Use the describe-network-interfaces command.

```
aws ec2 describe-network-interfaces \
    --network-interface-ids eni-1234567890abcdef0 \
    --query NetworkInterfaces[].[NetworkInterfaceId,Attachment.EnaSrdSpecification]
```

The following is example output.

```
[
    [
        "eni-1234567890abcdef0",
        {
            "EnaSrdEnabled": true,
```

```
            "EnaSrdUdpSpecification": {
                "EnaSrdUdpEnabled": false
            }
        }
    ]
]
```

PowerShell

To get the ENA Express settings for a network interface

Use the Get-EC2NetworkInterface cmdlet.

```
Get-EC2NetworkInterface `
    -NetworkInterfaceId eni-1234567890abcdef0 | `
Select-Object `
    Association,
    NetworkInterfaceId,
    OwnerId,
    @{Name = 'AttachTime'; Expression = { $_.Attachment.AttachTime } },
    @{Name = 'AttachmentId'; Expression = { $_.Attachment.AttachmentId } },
    @{Name = 'DeleteOnTermination'; Expression =
 { $_.Attachment.DeleteOnTermination } },
    @{Name = 'NetworkCardIndex'; Expression = { $_.Attachment.NetworkCardIndex } },
    @{Name = 'InstanceId'; Expression = { $_.Attachment.InstanceId } },
    @{Name = 'InstanceOwnerId'; Expression = { $_.Attachment.InstanceOwnerId } },
    @{Name = 'Status'; Expression = { $_.Attachment.Status } },
    @{Name = 'EnaSrdEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled } },
    @{Name = 'EnaSrdUdpEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled } }
```

The following is example output.

```
Association         :
NetworkInterfaceId  : eni-0d1234e5f6a78901b
OwnerId             : 111122223333
AttachTime          : 6/11/2022 1:13:11 AM
AttachmentId        : eni-attach-0d1234e5f6a78901b
DeleteOnTermination : True
NetworkCardIndex    : 0
InstanceId          : i-1234567890abcdef0
InstanceOwnerId     : 111122223333
```

```
Status              : attached
EnaSrdEnabled       : True
EnaSrdUdpEnabled    : False
```

Configure ENA Express settings for your EC2 instance

You can configure ENA Express for supported EC2 instance types without needing to install any additional software. For more information, see the section called “Supported instance types for ENA Express”.

Console

To manage ENA Express for a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is attached to an instance. You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page. This opens the **Manage ENA Express** dialog, with the selected network interface ID and current settings displayed.

   If the network interface you selected is not attached to an instance, this action does not appear in the menu.
5. To use **ENA Express**, select the **Enable** checkbox.
6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** checkbox.
7. To save your settings, choose **Save**.

To manage ENA Express for an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Instances**.
3. Select the instance that you want to manage. You can choose the **Instance ID** to open the detail page, or you can select the checkbox on the left side of the list.

4. Select the **Network interface** to configure for your instance.
5. Choose **Manage ENA Express** from the **Action** menu at the top right side of the page.
6. To configure ENA Express for a network interface that's attached to your instance, select it from the **Network interface** list.
7. To use **ENA Express** for the selected network interface attachment, select the **Enable** checkbox.
8. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** checkbox.
9. To save your settings, choose **Save**.

To configure ENA Express when you attach a network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the left navigation pane, choose **Network interfaces**.
3. Select a network interface that is not attached to an instance (**Status** is **Available**). You can choose the **Network interface ID** link to open the detail page, or you can select the checkbox on the left side of the list.
4. Select the **Instance** that you'll attach to.
5. To use **ENA Express** after you attach the network interface to the instance, select the **Enable** checkbox.
6. When ENA Express is enabled, you can configure UDP settings. To use **ENA Express UDP**, select the **Enable** checkbox.
7. To attach the network interface to the instance and save your ENA Express settings, choose **Attach**.

AWS CLI

To configure ENA Express when you attach a network interface

Use the attach-network-interface command, as shown in the following examples.

Example 1: Use ENA Express for TCP traffic, but not UDP traffic

This example configures `EnaSrdEnabled` as `true`, and allows `EnaSrdUdpEnabled` to default to `false`.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-1234567890abcdef0 \
    --instance-id i-1234567890abcdef0 \
    --device-index 1 \
    --ena-srd-specification 'EnaSrdEnabled=true'
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

This example configures both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
aws ec2 attach-network-interface \
    --network-interface-id eni-1234567890abcdef0 \
    --instance-id i-1234567890abcdef0 \
    --device-index 1 \
    --ena-srd-specification
 'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'
```

To update ENA Express settings for a network interface attachment

Use the modify-network-interface-attribute command as shown in the following examples.

Example 1: Use ENA Express for TCP traffic, but not UDP traffic

This example configures `EnaSrdEnabled` as `true`, and allows `EnaSrdUdpEnabled` to default to `false` if it has never been set previously.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --ena-srd-specification 'EnaSrdEnabled=true'
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

This example configures both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --ena-srd-specification
 'EnaSrdEnabled=true,EnaSrdUdpSpecification={EnaSrdUdpEnabled=true}'
```

Example 3: Stop using ENA Express for UDP traffic

This example configures `EnaSrdUdpEnabled` as `false`.

```
aws ec2 modify-network-interface-attribute \
    --network-interface-id eni-1234567890abcdef0 \
    --ena-srd-specification 'EnaSrdUdpSpecification={EnaSrdUdpEnabled=false}'
```

PowerShell

To configure ENA Express when you attach a network interface

Use the Add-EC2NetworkInterface cmdlet as shown in the following examples.

Example 1: Use ENA Express for TCP traffic, but not UDP traffic

This example configures `EnaSrdEnabled` as `true`, and allows `EnaSrdUdpEnabled` to default to `false`.

```
Add-EC2NetworkInterface `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -InstanceId i-1234567890abcdef0 `
    -DeviceIndex 1 `
    -EnaSrdSpecification_EnaSrdEnabled $true
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

This example configures both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
Add-EC2NetworkInterface `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -InstanceId i-1234567890abcdef0 `
    -DeviceIndex 1 `
    -EnaSrdSpecification_EnaSrdEnabled $true `
    -EnaSrdUdpSpecification_EnaSrdUdpEnabled $true
```

To configure ENA Express settings for your network interface attachment

Use the Edit-EC2NetworkInterfaceAttribute cmdlet as shown in the following examples.

Example 1: Use ENA Express for TCP traffic, but not UDP traffic

This example configures `EnaSrdEnabled` as `true`, and allows `EnaSrdUdpEnabled` to default to `false` if it has never been set previously.

```
Edit-EC2NetworkInterfaceAttribute `
```

```
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -EnaSrdSpecification_EnaSrdEnabled $true ;
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | `
Select-Object `
    NetworkInterfaceId,
    @{Name = 'EnaSrdEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }},
    @{Name = 'EnaSrdUdpEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | `
Format-List
```

Example 2: Use ENA Express for both TCP traffic and UDP traffic

This example configures both `EnaSrdEnabled` and `EnaSrdUdpEnabled` as `true`.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-1234567890abcdef0 `
    -EnaSrdSpecification_EnaSrdEnabled $true `
    -EnaSrdSpecification_EnaSrdUdpSpecification_EnaSrdUdpEnabled $true ;
Get-EC2NetworkInterface -NetworkInterfaceId eni-1234567890abcdef0 | `
Select-Object `
    NetworkInterfaceId,
    @{Name = 'EnaSrdEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }},
    @{Name = 'EnaSrdUdpEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | `
Format-List
```

Example 3: Stop using ENA Express for UDP traffic

This example configures `EnaSrdUdpEnabled` as `false`.

```
Edit-EC2NetworkInterfaceAttribute `
    -NetworkInterfaceId eni-0123f4567890a1b23 `
    -EnaSrdSpecification_EnaSrdUdpSpecification_EnaSrdUdpEnabled $false ;
Get-EC2NetworkInterface -NetworkInterfaceId eni-0123f4567890a1b23 | `
Select-Object `
    NetworkInterfaceId,
    @{Name = 'EnaSrdEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdEnabled }},
    @{Name = 'EnaSrdUdpEnabled'; Expression =
 { $_.Attachment.EnaSrdSpecification.EnaSrdUdpSpecification.EnaSrdUdpEnabled }} | `
Format-List
```

Configure ENA Express at launch

You can use one of the following methods to configure ENA Express directly when you launch an instance. The specified links refer you to the AWS Management Console instructions for these methods.

- **Launch instance wizard** – You can configure ENA Express at launch with the launch instance wizard. For more information, see **Advanced network configuration** in the Network settings for the launch instance wizard.
- **Launch template** – You can configure ENA Express at launch when you use a launch template. For more information, see the Create an Amazon EC2 launch template page, then expand the **Network settings** section and review the **Advanced network configuration**.

Enhanced networking with the Intel 82599 VF interface

For Xen-based instances, the Intel 82599 Virtual Function (VF) interface provides enhanced networking capabilities. The interface uses the Intel `ixgbevf` driver.

The following tabs show how to verify the network adapter driver that's installed for your instance operating system.

Linux

Linux network interface driver

Use the following command to verify that the module is being used on a particular interface, substituting the interface name that you want to check. If you are using a single interface (default), this is `eth0`. If the operating system supports predictable network names, this could be a name like `ens5`.

In the following example, the `ixgbevf` module is not loaded, because the listed driver is `vif`.

```
[ec2-user ~]$ ethtool -i eth0
driver: vif
version:
firmware-version:
bus-info: vif-0
supports-statistics: yes
supports-test: no
supports-eeprom-access: no
```

```
supports-register-dump: no
supports-priv-flags: no
```

In this example, the `ixgbevf` module is loaded. This instance has enhanced networking properly configured.

```
[ec2-user ~]$ ethtool -i eth0
driver: ixgbevf
version: 4.0.3
firmware-version: N/A
bus-info: 0000:00:03.0
supports-statistics: yes
supports-test: yes
supports-eeprom-access: no
supports-register-dump: yes
supports-priv-flags: no
```

Windows

Windows network adapter

To verify that the driver is installed, connect to your instance and open Device Manager. You should see `Intel(R) 82599 Virtual Function` listed under **Network adapters**.

Contents

- Prepare your instance for enhanced networking
- Test whether enhanced networking is enabled
- Enable enhanced networking on your instance
- Troubleshoot connectivity issues

Prepare your instance for enhanced networking

To prepare for enhanced networking using the Intel 82599 VF interface, set up your instance as follows:

- Verify that the instance type is one of the following: C3, C4, D2, I2, M4 (excluding `m4.16xlarge`), and R3.
- Ensure that the instance has internet connectivity.

- If you have important data on the instance that you want to preserve, you should back that data up now by creating an AMI from your instance. Updating kernels and kernel modules, as well as enabling the `sriovNetSupport` attribute, might render incompatible instances or operating systems unreachable. If you have a recent backup, your data will still be retained if this happens.
- **Linux instances** – Launch the instance from an HVM AMI using Linux kernel version of 2.6.32 or later. The latest Amazon Linux HVM AMIs have the modules required for enhanced networking installed and have the required attributes set. Therefore, if you launch an Amazon EBS–backed, enhanced networking–supported instance using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance.

  > **Warning**
  >
  > Enhanced networking is supported only for HVM instances. Enabling enhanced networking with a PV instance can make it unreachable. Setting this attribute without the proper module or module version can also make your instance unreachable.

- **Windows instances** – Launch the instance from a 64-bit HVM AMI. You can't enable enhanced networking on Windows Server 2008. Enhanced networking is already enabled for Windows Server 2012 R2 and Windows Server 2016 and later AMIs. Windows Server 2012 R2 includes Intel driver 1.0.15.3 and we recommend that you upgrade that driver to the latest version using the Pnputil.exe utility.
- Use AWS CloudShell from the AWS Management Console, or install and configure the AWS CLI or the AWS Tools for Windows PowerShell on any computer you choose, preferably your local desktop or laptop. For more information, see Access Amazon EC2 or the AWS CloudShell User Guide. Enhanced networking cannot be managed from the Amazon EC2 console.

Test whether enhanced networking is enabled

Verify that the `sriovNetSupport` attribute is set on the instance or the image.

AWS CLI

To check the instance attribute (sriovNetSupport)

Use the following describe-instance-attribute command. If the attribute is set, the value is `simple`.

```
aws ec2 describe-instance-attribute \
```

```
    --instance-id i-1234567890abcdef0 \
    --attribute sriovNetSupport
```

To check the image attribute (sriovNetSupport)

Use the following describe-images command. If the attribute is set, the value is `simple`.

```
aws ec2 describe-images \
    --image-id ami-0abcdef1234567890 \
    --query "Images[].SriovNetSupport"
```

PowerShell

To check the instance attribute (sriovNetSupport)

Use the Get-EC2InstanceAttribute cmdlet. If the attribute is set, the value is `simple`.

```
Get-EC2InstanceAttribute `
    -InstanceId i-1234567890abcdef0 `
    -Attribute sriovNetSupport
```

To check the image attribute (sriovNetSupport)

Use the following describe-images command. If the attribute is set, the value is `simple`.

```
(Get-EC2Image -ImageId ami-0abcdef1234567890).SriovNetSupport
```

Enable enhanced networking on your instance

The procedure that you use depends on the operating system of the instance.

> **Warning**
>
> There is no way to disable the enhanced networking attribute after you've enabled it.

Amazon Linux

The latest Amazon Linux HVM AMIs have the `ixgbevf` module required for enhanced networking installed and have the required `sriovNetSupport` attribute set. Therefore, if you launch an

instance type using a current Amazon Linux HVM AMI, enhanced networking is already enabled for your instance. For more information, see Test whether enhanced networking is enabled.

If you launched your instance using an older Amazon Linux AMI and it does not have enhanced networking enabled already, use the following procedure to enable enhanced networking.

To enable enhanced networking

1. Connect to your instance.
2. From the instance, run the following command to update your instance with the newest kernel and kernel modules, including `ixgbevf`:

   ```
   [ec2-user ~]$ sudo yum update
   ```

3. From your local computer, reboot your instance using the Amazon EC2 console or one of the following commands: reboot-instances (AWS CLI) or Restart-EC2Instance (AWS Tools for Windows PowerShell).
4. Connect to your instance again and verify that the `ixgbevf` module is installed and at the minimum recommended version using the **modinfo ixgbevf** command from Test whether enhanced networking is enabled.
5. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI) or Stop-EC2Instance (AWS Tools for Windows PowerShell).

   [Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, skip to the next procedure.
6. From your local computer, enable the enhanced networking attribute using one of the following commands:

   AWS CLI

   Use the modify-instance-attribute command as follows.

   ```
   aws ec2 modify-instance-attribute \
       --instance-id i-1234567890abcdef0 \
       --sriov-net-support simple
   ```

PowerShell

Use the Edit-EC2InstanceAttribute cmdlet as follows.

```
Edit-EC2InstanceAttribute `
    -InstanceId i-1234567890abcdef0 `
    -SriovNetSupport "simple"
```

7. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
8. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).
9. Connect to your instance and verify that the `ixgbevf` module is installed and loaded on your network interface using the **ethtool -i eth*n*** command from Test whether enhanced networking is enabled.

To enable enhanced networking (instance store-backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an Amazon S3-backed AMI, making sure to enable the enhanced networking attribute when you register the AMI.

AWS CLI

Use the register-image command as follows.

```
aws ec2 register-image --sriov-net-support simple ...
```

PowerShell

Use Register-EC2Image as follows.

```
Register-EC2Image -SriovNetSupport "simple" ...
```

Ubuntu

Before you begin, check if enhanced networking is already enabled on your instance.

The Quick Start Ubuntu HVM AMIs include the necessary drivers for enhanced networking. If you have a version of `ixgbevf` earlier than 2.16.4, you can install the `linux-aws` kernel package to get the latest enhanced networking drivers.

The following procedure provides the general steps for compiling the `ixgbevf` module on an Ubuntu instance.

To install the `linux-aws` kernel package

1. Connect to your instance.
2. Update the package cache and packages.

```
ubuntu:~$ sudo apt-get update && sudo apt-get upgrade -y linux-aws
```

> **Important**
>
> If during the update process, you are prompted to install `grub`, use `/dev/xvda` to install `grub`, and then choose to keep the current version of `/boot/grub/menu.lst`.

Other Linux distributions

Before you begin, check if enhanced networking is already enabled on your instance. The latest Quick Start HVM AMIs include the necessary drivers for enhanced networking, therefore you do not need to perform additional steps.

The following procedure provides the general steps if you need to enable enhanced networking with the Intel 82599 VF interface on a Linux distribution other than Amazon Linux or Ubuntu. For more information, such as detailed syntax for commands, file locations, or package and tool support, see the specific documentation for your Linux distribution.

To enable enhanced networking on Linux

1. Connect to your instance.
2. Download the source for the `ixgbevf` module on your instance from Sourceforge at https://sourceforge.net/projects/e1000/files/ixgbevf%20stable/.

Versions of `ixgbevf` earlier than 2.16.4, including version 2.14.2, do not build properly on some Linux distributions, including certain versions of Ubuntu.

3. Compile and install the `ixgbevf` module on your instance.

   > **Warning**
   >
   > If you compile the `ixgbevf` module for your current kernel and then upgrade your kernel without rebuilding the driver for the new kernel, your system might revert to the distribution-specific `ixgbevf` module at the next reboot. This could make your system unreachable if the distribution-specific version is incompatible with enhanced networking.

4. Run the **sudo depmod** command to update module dependencies.
5. Update `initramfs` on your instance to ensure that the new module loads at boot time.
6. Determine if your system uses predictable network interface names by default. Systems that use **systemd** or **udev** versions 197 or greater can rename Ethernet devices and they do not guarantee that a single network interface will be named `eth0`. This behavior can cause problems connecting to your instance. For more information and to see other configuration options, see Predictable Network Interface Names on the freedesktop.org website.

   a. You can check the **systemd** or **udev** versions on RPM-based systems with the following command:

   ```
   [ec2-user ~]$ rpm -qa | grep -e '^systemd-[0-9]\+\|^udev-[0-9]\+'
       systemd-208-11.el7_0.2.x86_64
   ```

   In the above Red Hat Enterprise Linux 7 example, the **systemd** version is 208, so predictable network interface names must be disabled.

   b. Disable predictable network interface names by adding the `net.ifnames=0` option to the `GRUB_CMDLINE_LINUX` line in `/etc/default/grub`.

   ```
   [ec2-user ~]$ sudo sed -i '/^GRUB\_CMDLINE\_LINUX/s/\"$/\ net\.ifnames\=0\"/' /
   etc/default/grub
   ```

   c. Rebuild the grub configuration file.

```
[ec2-user ~]$ sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

7. [EBS-backed instance] From your local computer, stop the instance using the Amazon EC2 console or one of the following commands: stop-instances (AWS CLI) or Stop-EC2Instance (AWS Tools for Windows PowerShell).

   [Instance store-backed instance] You can't stop the instance to modify the attribute. Instead, skip to the next procedure.

8. From your local computer, enable the enhanced networking attribute using one of the following commands:

   AWS CLI

   Use the modify-instance-attribute command as follows.

   ```
   aws ec2 modify-instance-attribute \
       --instance-id i-1234567890abcdef0 -\
       -sriov-net-support simple
   ```

   PowerShell

   Use the Edit-EC2InstanceAttribute cmdlet as follows.

   ```
   Edit-EC2InstanceAttribute `
       -InstanceId i-1234567890abcdef0 `
       -SriovNetSupport "simple"
   ```

9. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.

   If your instance operating system contains an `/etc/udev/rules.d/70-persistent-net.rules` file, you must delete it before creating the AMI. This file contains the MAC address for the Ethernet adapter of the original instance. If another instance boots with this file, the operating system will be unable to find the device and `eth0` might fail, causing boot issues. This file is regenerated at the next boot cycle, and any instances launched from the AMI create their own version of the file.

10. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).
11. (Optional) Connect to your instance and verify that the module is installed.

To enable enhanced networking (instance store–backed instances)

Follow the previous procedure until the step where you stop the instance. Create a new AMI as described in Create an Amazon S3-backed AMI, making sure to enable the enhanced networking attribute when you register the AMI.

AWS CLI

Use the register-image command as follows.

```
aws ec2 register-image --sriov-net-support simple ...
```

PowerShell

Use Register-EC2Image as follows.

```
Register-EC2Image -SriovNetSupport "simple" ...
```

Windows

If you launched your instance and it does not have enhanced networking enabled already, you must download and install the required network adapter driver on your instance, and then set the `sriovNetSupport` instance attribute to activate enhanced networking. You can only enable this attribute on supported instance types. For more information, see Enhanced networking on Amazon EC2 instances.

To enable enhanced networking

1. Connect to your instance and log in as the local administrator.
2. [Windows Server 2016 and later] Run the following EC2 Launch PowerShell script to configure the instance after the driver is installed.

```
PS C:\> C:\ProgramData\Amazon\EC2-Windows\Launch\Scripts\InitializeInstance.ps1 -
Schedule
```

> **Important**
>
> The administrator password will reset when you enable the initialize instance EC2 Launch script. You can modify the configuration file to disable the administrator password reset by specifying it in the settings for the initialization tasks.

3. From the instance, download the Intel network adapter driver for your operating system:

   - **Windows Server 2022**

     Visit the download page and download `Wired_driver_version_x64.zip`.
   - **Windows Server 2019** including for Server version 1809 and later*

     Visit the download page and download `Wired_driver_version_x64.zip`.
   - **Windows Server 2016** including for Server version 1803 and earlier*

     Visit the download page and download `Wired_driver_version_x64.zip`.
   - **Windows Server 2012 R2**

     Visit the download page and download `Wired_driver_version_x64.zip`.
   - **Windows Server 2012**

     Visit the download page and download `Wired_driver_version_x64.zip`.
   - **Windows Server 2008 R2**

     Visit the download page and download `PROWinx64Legacy.exe`.

   *Server versions 1803 and earlier as well as 1809 and later are not specifically addressed on the Intel Drivers and Software pages.

4. Install the Intel network adapter driver for your operating system.

   - **Windows Server 2008 R2**

     1. In the **Downloads** folder, locate the `PROWinx64Legacy.exe` file and rename it to `PROWinx64Legacy.zip`.

2. Extract the contents of the `PROWinx64Legacy.zip` file.
3. Open the command line, navigate to the extracted folder, and run the following command to use the `pnputil` utility to add and install the INF file in the driver store.

```
C:\> pnputil -a PROXGB\Winx64\NDIS62\vxn62x64.inf
```

- **Windows Server 2022, Windows Server 2019, Windows Server 2016, Windows Server 2012 R2, and Windows Server 2012**

1. In the **Downloads** folder, extract the contents of the `Wired_driver_`*`version`*`_x64.zip` file.
2. Open the command line, navigate to the extracted folder, and run one of the following commands to use the `pnputil` utility to add and install the INF file in the driver store.

   - Windows Server 2022

   ```
   pnputil -i -a PROXGB\Winx64\NDIS68\vxn68x64.inf
   ```

   - Windows Server 2019

   ```
   pnputil -i -a PROXGB\Winx64\NDIS68\vxn68x64.inf
   ```

   - Windows Server 2016

   ```
   pnputil -i -a PROXGB\Winx64\NDIS65\vxn65x64.inf
   ```

   - Windows Server 2012 R2

   ```
   pnputil -i -a PROXGB\Winx64\NDIS64\vxn64x64.inf
   ```

   - Windows Server 2012

   ```
   pnputil -i -a PROXGB\Winx64\NDIS63\vxn63x64.inf
   ```

5. From your local computer, enable the enhanced networking attribute using one of the following commands:

   AWS CLI

   Use the modify-instance-attribute command as follows.

```
aws ec2 modify-instance-attribute \
    --instance-id i-1234567890abcdef0 \
    --sriov-net-support simple
```

PowerShell

Use the Edit-EC2InstanceAttribute cmdlet as follows.

```
Edit-EC2InstanceAttribute `
    -InstanceId i-1234567890abcdef0 `
    -SriovNetSupport "simple"
```

6. (Optional) Create an AMI from the instance, as described in Create an Amazon EBS-backed AMI. The AMI inherits the enhanced networking attribute from the instance. Therefore, you can use this AMI to launch another instance with enhanced networking enabled by default.
7. From your local computer, start the instance using the Amazon EC2 console or one of the following commands: start-instances (AWS CLI) or Start-EC2Instance (AWS Tools for Windows PowerShell).

Troubleshoot connectivity issues

If you lose connectivity while enabling enhanced networking, the `ixgbevf` module might be incompatible with the kernel. Try installing the version of the `ixgbevf` module included with the distribution of Linux for your instance.

If you enable enhanced networking for a PV instance or AMI, this can make your instance unreachable.

For more information, see How do I turn on and configure enhanced networking on my EC2 instances?

Monitor network performance for ENA settings on your EC2 instance

The Elastic Network Adapter (ENA) driver publishes network performance metrics from the instances where they are enabled. You can use these metrics to troubleshoot instance performance issues, choose the right instance size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the performance available on an instance.

Amazon EC2 defines network maximums at the instance level to ensure a high-quality networking experience, including consistent network performance across instance sizes. AWS provides maximums for the following for each instance:

- **Bandwidth capability** – Each EC2 instance has a maximum bandwidth for aggregate inbound and outbound traffic, based on instance type and size. Some instances use a network I/O credit mechanism to allocate network bandwidth based on average bandwidth utilization. Amazon EC2 also has maximum bandwidth for traffic to Direct Connect and the internet. For more information, see Amazon EC2 instance network bandwidth.
- **Packet-per-second (PPS) performance** – Each EC2 instance has a maximum PPS performance, based on instance type and size.
- **Connections tracked** – The security group tracks each connection established to ensure that return packets are delivered as expected. There is a maximum number of connections that can be tracked per instance. For more information, see Amazon EC2 security group connection tracking
- **Link-local service access** – Amazon EC2 provides a maximum PPS per network interface for traffic to local proxy services such as the Amazon DNS service, the Instance Metadata Service, and the Amazon Time Sync Service.

When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets. You can monitor when traffic exceeds a maximum using the network performance metrics. These metrics inform you, in real time, of impact to network traffic and possible network performance issues.

Contents

- Requirements
- Metrics for the ENA driver
- View the network performance metrics for your instance
- Metrics for ENA Express
- Network performance metrics with the DPDK driver for ENA
- Metrics on instances running FreeBSD

Requirements

Linux instances

- Install ENA driver version 2.2.10 or later. To verify the installed version, use the **ethtool** command. In the following example, the version meets the minimum requirement.

```
[ec2-user ~]$ ethtool -i eth0 | grep version
version: 2.2.10
```

  To upgrade your ENA driver, see Enhanced networking.
- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see Collect network performance metrics in the *Amazon CloudWatch User Guide*.
- To support the `conntrack_allowance_available` metric, install ENA driver version 2.8.1 or later.
- To override the egress fragment PPS limit of 1024, install ENA driver version 2.13.3 or later.

Windows instances

- Install ENA driver version 2.2.2 or later. To verify the installed version, use Device Manager as follows.
  1. Open Device Manager by running `devmgmt.msc`.
  2. Expand **Network Adapters**.
  3. Choose **Amazon Elastic Network Adapter**, **Properties**.
  4. On the **Driver** tab, locate **Driver Version**.

  To upgrade your ENA driver, see Enhanced networking.
- To import these metrics to Amazon CloudWatch, install the CloudWatch agent. For more information, see Collect advanced network metrics in the *Amazon CloudWatch User Guide*.

Metrics for the ENA driver

The ENA driver delivers the following metrics to the instance in real time. They provide the cumulative number of packets queued or dropped on each network interface since the last driver reset.

Metric	Description	Supported on
bw_in_allowance_exceeded	The number of packets queued or dropped because the inbound aggregate bandwidth exceeded the maximum for the instance.	All instance types
bw_out_allowance_exceeded	The number of packets queued or dropped because the outbound aggregate bandwidth exceeded the maximum for the instance.	All instance types
conntrack_allowance_exceeded	The number of packets dropped because connection tracking exceeded the maximum for the instance and new connections could not be established. This can result in packet loss for traffic to or from the instance.	All instance types
conntrack_allowance_available	The number of tracked connections that can be established by the instance before hitting the Connections Tracked allowance of that instance type.	Nitro-based instances only
linklocal_allowance_exceeded	The number of packets dropped because the PPS of the traffic to local proxy services exceeded the maximum for the network interface. This impacts traffic to the Amazon DNS service, the Instance Metadata Service, and the Amazon Time Sync Service,	All instance types

Metric	Description	Supported on
	but does not impact traffic to custom DNS resolvers.	
pps_allowance_exceeded	The number of packets queued or dropped because the bidirectional PPS exceeded the maximum for the instance. *	All instance types

* Depending on the fragment proxy mode setting for ENA Linux driver v2.13.3 or later, this limit can also include egress fragment drops that exceed 1024 PPS for the network interface. If fragment proxy mode is enabled for the Linux driver, egress fragment drops bypass the 1024 PPS limit that usually applies and are counted within standard PPS allowances. Fragment proxy mode is disabled by default.

View the network performance metrics for your instance

The procedure that you use depends on the operating system of the instance.

Linux instances

You can publish metrics to your favorite tools to visualize the metric data. For example, you can publish the metrics to Amazon CloudWatch using the CloudWatch agent. The agent enables you to select individual metrics and control publication.

You can also use the **ethtool** to retrieve the metrics for each network interface, such as eth0, as follows.

```
[ec2-user ~]$ ethtool -S eth0
     bw_in_allowance_exceeded: 0
     bw_out_allowance_exceeded: 0
     pps_allowance_exceeded: 0
     conntrack_allowance_exceeded: 0
     linklocal_allowance_exceeded: 0
     conntrack_allowance_available: 136812
```

Windows instances

You can view the metrics using any consumer of Windows performance counters. The data can be parsed according to the EnaPerfCounters manifest. This is an XML file that defines the performance counter provider and its countersets.

To install the manifest

If you launched the instance using an AMI that contains ENA driver 2.2.2 or later, or used the install script in the driver package for ENA driver 2.2.2, the manifest is already installed. To install the manifest manually, use the following steps:

1. Remove the existing manifest using the following command:

```
unlodctr /m:EnaPerfCounters.man
```

2. Copy the manifest file `EnaPerfCounters.man` from the driver installation package to `%SystemRoot%\System32\drivers`.
3. Install the new manifest using the following command:

```
lodctr /m:EnaPerfCounters.man
```

To view metrics using Performance Monitor

1. Open Performance Monitor.
2. Press Ctrl+N to add new counters.
3. Choose **ENA Packets Shaping** from the list.
4. Select the instances to monitor and choose **Add**.
5. Choose **OK**.

Metrics for ENA Express

ENA Express is powered by AWS Scalable Reliable Datagram (SRD) technology. SRD is a high performance network transport protocol that uses dynamic routing to increase throughput and minimize tail latency. If you've enabled ENA Express for the network interface attachments on both the sending instance and receiving instance, you can use ENA Express metrics to help ensure

that your instances take full advantage of the performance improvements that SRD technology provides. For example:

- Evaluate your resources to ensure that they have sufficient capacity to establish more SRD connections.
- Identify where there are potential issues that prevent eligible outgoing packets from using SRD.
- Calculate the percentage of outgoing traffic that uses SRD for the instance.
- Calculate the percentage of incoming traffic that uses SRD for the instance.

> **Note**
>
> To produce metrics, use driver version 2.8 or higher.

To see a list of metrics for your Linux instance that's filtered for ENA Express, run the following **ethtool** command for your network interface (shown here as `eth0`). Take note of the value of the `ena_srd_mode` metric.

```
[ec2-user ~]$ ethtool -S eth0 | grep ena_srd
NIC statistics:
 ena_srd_mode: 1
 ena_srd_tx_pkts: 0
 ena_srd_eligible_tx_pkts: 0
 ena_srd_rx_pkts: 0
 ena_srd_resource_utilization: 0
```

The following metrics are available for all instances that have ENA Express enabled.

ena_srd_mode

Describes which ENA Express features are enabled. Values are as follows:

- `0` = ENA Express off, UDP off
- 1 = ENA Express on, UDP off
- 2 = ENA Express off, UDP on

> **Note**
>
> This only happens when ENA Express was originally enabled, and UDP was configured to use it. The prior value is retained for UDP traffic.

- 3 = ENA Express on, UDP on

ena_srd_eligible_tx_pkts

The number of network as follows:

- Both sending and receiving instance types are supported. See the Supported instance types for ENA Express table for more information.
- Both sending and receiving instances must have ENA Express configured.
- The sending and receiving instances must run in the same Region.
- The network path between the instances must not include middleware boxes. ENA Express doesn't currently support middleware boxes.

> **Note**
>
> The ENA Express eligibility metric covers source and destination requirements, and the network between the two endpoints. Eligible packets can still be disqualified after they've already been counted. For example, if an eligible packet is over the maximum transmission unit (MTU) limit, it falls back to standard ENA transmission, though the packet is still reflected as eligible in the counter.

ena_srd_tx_pkts

The number of SRD packets transmitted within a given time period.

ena_srd_rx_pkts

The number of SRD packets received within a given time period.

ena_srd_resource_utilization

The percentage of the maximum allowed memory utilization for concurrent SRD connections that the instance has consumed.

To confirm if packet transmission is using SRD, you can compare the number of eligible packets (`ena_srd_eligible_tx_pkts` metric) to the number of SRD packets transmitted (`ena_srd_tx_pkts` metric) during a given time period.

Egress traffic (outgoing packets)

To ensure that your egress traffic uses SRD as expected, compare the number of SRD eligible packets (`ena_srd_eligible_tx_pkts`) with the number of SRD packets sent (`ena_srd_tx_pkts`) over a given time period.

Significant differences between the number of eligible packets and the number of SRD packets sent are often caused by resource utilization issues. When the network card attached to the instance has used up its maximum resources, or if packets are over the MTU limit, eligible packets are not able to transmit through SRD, and must fall back to standard ENA transmission. Packets can also fall into this gap during live migrations or live server updates. Additional troubleshooting is required to determine the root cause.

> **Note**
>
> You can ignore occasional minor differences between the number of eligible packets and the number of SRD packets. This can happen when your instance establishes a connection to another instance for SRD traffic, for example.

To find out what percentage of your total egress traffic over a given time period uses SRD, compare the number of SRD packets sent (`ena_srd_tx_pkts`) to the total number of packets sent for the instance (`NetworkPacketOut`) during that time.

Ingress traffic (incoming packets)

To find out what percentage of your ingress traffic uses SRD, compare the number of SRD packets received (`ena_srd_rx_pkts`) over a given time period to the total number of packets received for the instance (`NetworkPacketIn`) during that time.

Resource utilization

Resource utilization is based on the number of concurrent SRD connections a single instance can hold at a given time. The resource utilization metric (`ena_srd_resource_utilization`) keeps track of your current utilization for the instance. As utilization approaches 100%, you can expect to see performance issues. ENA Express falls back from SRD to standard ENA transmission, and the

possibility of dropped packets increases. High resource utilization is a sign that it's time to scale the instance out to improve network performance.

> **Note**
>
> When the network traffic for an instance exceeds a maximum, AWS shapes the traffic that exceeds the maximum by queueing and then dropping network packets.

Persistence

Egress and ingress metrics accrue while ENA Express is enabled for the instance. Metrics stop accruing if ENA Express is deactivated, but persist as long as the instance is still running. Metrics reset if the instance reboots or is terminated, or if the network interface is detached from the instance.

Network performance metrics with the DPDK driver for ENA

The ENA driver version 2.2.0 and later supports network metrics reporting. DPDK 20.11 includes the ENA driver 2.2.0 and is the first DPDK version to support this feature.

DPDK driver v25.03 or later supports fragment proxy mode. If fragment proxy mode is enabled for the DPDK driver, egress fragment drops bypass the 1024 PPS limit that usually applies and are counted within standard PPS allowances. Fragment proxy mode is disabled by default.

You can use an example application to view DPDK statistics. To start an interactive version of the example application, run the following command.

```
./app/dpdk-testpmd -- -i
```

Within this interactive session, you can enter a command to retrieve extended statistics for a port. The following example command retrieves the statistics for port 0.

```
show port xstats 0
```

The following is an example of an interactive session with the DPDK example application.

```
[root@ip-192.0.2.0 build]# ./app/dpdk-testpmd -- -i

Metrics on instances running FreeBSD

Starting with version 2.3.0, the ENA FreeBSD driver supports collecting network performance metrics on instances running FreeBSD. To enable the collection of FreeBSD metrics, enter the following command and set *interval* to a value between 1 and 3600. This specifies how often, in seconds, to collect FreeBSD metrics.

```
sysctl dev.ena.network_interface.eni_metrics.sample_interval=interval
```

For example, the following command sets the driver to collect FreeBSD metrics on network interface 1 every 10 seconds:

```
sysctl dev.ena.1.eni_metrics.sample_interval=10
```

To turn off the collection of FreeBSD metrics, you can run the preceding command and specify `0` as the *interval*.

After you enable collecting FreeBSD metrics, you can retrieve the latest set of collected metrics by running the following command.

```
sysctl dev.ena.network_interface.eni_metrics
```

Improve network latency for Linux based EC2 instances

Network latency is the amount of time it takes for a packet of data to travel from its source to its destination. Applications that send data across the network depend on timely responses to provide a positive user experience. High network latency can lead to various issues, such as the following:

- Slow load times for web pages
- Video stream lag
- Difficulty accessing online resources

This section outlines steps that you can take to improve the network latency on Amazon EC2 instances that run on Linux. To achieve optimal latency, follow these steps to configure your instance, kernel, and ENA driver settings. For additional configuration guidance, see the ENA Linux Driver Best Practices and Performance Optimization Guide on GitHub.

> **Note**
>
> Steps and settings may vary slightly, depending on your specific network hardware, the AMI that you launched your instance from, and your application use case. Before you make any changes, thoroughly test and monitor your network performance to ensure that you're getting the desired results.

Reduce the number of network hops for data packets

Each hop that a data packet takes as it moves from router to router increases network latency. Typically, traffic must take multiple hops to reach your destination. There are two ways to reduce network hops for your Amazon EC2 instances, as follows:

- **Cluster placement group** – When you specify a cluster placement group, Amazon EC2 launches instances that are in close proximity to each other, physically within the same Availability Zone (AZ) with tighter packing. The physical proximity of the instances in the group allows them

to take advantage of high-speed connectivity, resulting in low latency and high single flow throughput.

- **Dedicated Host** – A Dedicated Host is a physical server that's dedicated for your use. With a Dedicated Host, you can launch your instances to run on the same physical server. Communication between instances that run on the same Dedicated Host can happen without extra network hops.

How Linux kernel configuration affects latency

Linux kernel configuration can increase or decrease network latency. To achieve your latency optimization goals, it's important to fine-tune the Linux kernel configuration according to the specific requirements of your workload.

There are many configuration options for the Linux kernel that might help decrease network latency. The most impactful options are as follows.

- **Enable busy poll mode** – Busy poll mode reduces latency on the network receive path. When you enable busy poll mode, the socket layer code can directly poll the receive queue of a network device. The downside of busy polling is higher CPU usage in the host that comes from polling for new data in a tight loop. There are two global settings that control the number of microseconds to wait for packets for all interfaces.

  `busy_read`

  A low latency busy poll timeout for socket reads. This controls the number of microseconds to wait for the socket layer to read packets on the device queue. To enable the feature globally with the **sysctl** command, the Linux Kernel organization recommends a value of 50 microseconds. For more information, see busy_read in the *Linux kernel user's and administrator's guide*.

  ```
  [ec2-user ~]$ sudo sysctl -w net.core.busy_read=50
  ```

  `busy_poll`

  A low latency busy poll timeout for poll and select. This controls the number of microseconds to wait for events. The recommended value is between 50-100 microseconds, depending

on the number of sockets you're polling. The more sockets you add, the higher the number should be.

```
[ec2-user ~]$ sudo sysctl -w net.core.busy_poll=50
```

- **Configure CPU power states (C-states)** – C-states control the sleep levels that a core may enter when it's inactive. You might want to control C-states to tune your system for latency versus performance. In deeper C-states, the CPU is essentially "asleep" and can't respond to requests until it wakes up and transitions back to an active state. Putting cores to sleep takes time, and although a sleeping core allows more headroom for another core to boost to a higher frequency, it takes time for that sleeping core to wake back up and perform work.

  For example, if a core that's assigned to handle network packet interrupts is asleep, there might be a delay in servicing that interrupt. You can configure the system so that it doesn't use deeper C-states. However, while this configuration reduces the processor reaction latency, it also reduces the headroom available to other cores for Turbo Boost.

  To reduce the processor reaction latency, you can limit deeper C-states. For more information, see High performance and low latency by limiting deeper C-states in the *Amazon Linux 2 User Guide*.

Interrupt moderation

The ENA network driver enables communication between an instance and a network. The driver processes network packets and passes them on to the network stack or to the Nitro card. When a network packet comes in, the Nitro card generates an interrupt for the CPU to notify the software of an event.

Interrupt

An interrupt is a signal that a device or application sends to the processor. The interrupt tells the processor that an event has occurred or a condition has been met that requires immediate attention. Interrupts can handle time-sensitive tasks such as receiving data from a network interface, handling hardware events, or servicing requests from other devices.

Interrupt moderation

Interrupt moderation is a technique that reduces the number of interrupts a device generates by aggregating or delaying them. The purpose of interrupt moderation is to improve system performance by reducing the overhead associated with handling a large number of interrupts.

Too many interrupts increase CPU usage, impacting the throughput adversely, while too few interrupts increase the latency.

Dynamic interrupt moderation

Dynamic interrupt moderation is an enhanced form of interrupt moderation that dynamically adjusts the interrupt rate based on the current system load and traffic patterns. It aims to strike a balance between reducing interrupt overhead and packets per second, or bandwidth.

> **Note**
>
> Dynamic interrupt moderation is enabled by default in some AMIs (but can be enabled or disabled in all AMIs).

To minimize network latency, it might be necessary to disable interrupt moderation. However, this can also increase the overhead of interrupt processing. It's important to find the right balance between reducing latency and minimizing overhead. `ethtool` commands can help you configure interrupt moderation. By default, `rx-usecs` is set to `20`, and `tx-usecs` is set to `64`.

To get the current interrupt modification configuration, use the following command.

```
[ec2-user ~]$ ethtool -c interface | egrep "rx-usecs:|tx-usecs:|Adaptive RX"
Adaptive RX: on  TX: off
rx-usecs: 20
tx-usecs: 64
```

To disable interrupt modification and dynamic interrupt moderation, use the following command.

```
[ec2-user ~]$ sudo ethtool -C interface adaptive-rx off rx-usecs 0 tx-usecs 0
```

Nitro system considerations for performance tuning

The Nitro System is a collection of hardware and software components built by AWS that enable high performance, high availability, and high security. The Nitro System provides bare metal-like capabilities that eliminate virtualization overhead and support workloads that require full access to host hardware. For more detailed information, see AWS Nitro System.

All current generation EC2 instance types perform network packet processing on EC2 Nitro Cards. This topic covers high level packet handling on the Nitro card, common aspects of network

architecture and configuration that impact packet handling performance, and what actions you can take to achieve peak performance for your Nitro based instances.

Nitro Cards handle all input and output (I/O) interfaces, such as those needed for Virtual Private Clouds (VPCs). For all of the components that send or receive information over the network, the Nitro cards act as a self-contained computing device for I/O traffic that's physically separate from the system main board on which customer workloads run.

Network packet flow on Nitro cards

EC2 instances built on the Nitro system have hardware acceleration capabilities that enable faster packet processing, as measured by packets per second (PPS) throughput rates. When a Nitro card performs the initial evaluation for a new flow, it saves information that's the same for all packets in the flow, such as security groups, access control lists, and route table entries. When it processes additional packets for the same flow, it can use the saved information to reduce overhead for those packets.

Your connection rate is measured by the connections per second (CPS) metric. Each new connection requires additional processing overhead that must be factored into workload capability estimates. It's important to consider both the CPS and PPS metrics when you design your workloads.

How a connection is established

When a connection is established between a Nitro based instance and another endpoint, the Nitro card evaluates the full flow for the first packet that's sent or received between the two endpoints. For subsequent packets of the same flow, full reevaluation is usually not necessary. However, there are exceptions. For more information about the exceptions, see Packets that don't use hardware acceleration.

The following properties define the two endpoints and the packet flow between them. These five properties together are known as a 5-tuple flow.

- Source IP
- Source port
- Destination IP
- Destination port
- Communication protocol

The direction of the packet flow is known as *ingress* (inbound) and *egress* (outbound). The following high level descriptions summarize end to end network packet flow.

- **Ingress** – When a Nitro card handles an inbound network packet, it evaluates the packet against stateful firewall rules and access control lists. It tracks the connection, meters it, and performs other actions as applicable. Then it forwards the packet to its destination on the host CPU.
- **Egress** – When a Nitro card handles an outbound network packet, it looks up the remote interface destination, evaluates various VPC functions, applies rate limits, and performs other actions that apply. Then it forwards the packet to its next hop destination on the network.

Design your network for optimal performance

To take advantage of your Nitro system's performance capabilities, you must understand what your network processing needs are and how those needs affect the workload for your Nitro resources. Then you can design for optimal performance for your network landscape. Your infrastructure settings and application workload design and configuration can impact both the packet processing and connection rates. For example, if your application has a high rate of connection establishment, such as a DNS service, firewall, or virtual router, it will have less opportunity to take advantage of the hardware acceleration that only occurs after the connection is established.

You can configure application and infrastructure settings to streamline workloads and improve network performance. However, not all packets are eligible for acceleration. The Nitro system uses the full network flow for new connections and for packets that aren't eligible for acceleration.

The remainder of this section will focus on application and infrastructure design considerations to help ensure that packets flow within the accelerated path as much as possible.

Network design considerations for the Nitro system

When you configure network traffic for your instance, there are many aspects to consider that can affect PPS performance. After a flow is established, the majority of packets that regularly come in or go out are eligible for acceleration. However, exceptions exist to ensure that infrastructure designs and packet flows continue to meet protocol standards.

To get the best performance from your Nitro card, you should carefully consider the pros and cons of the following configuration details for your infrastructure and applications.

Infrastructure considerations

Your infrastructure configuration can affect your packet flow and processing efficiency. The following list includes some important considerations.

Network interface configuration with asymmetry

Security groups use connection tracking to track information about traffic that flows to and from the instance. Asymmetric routing, where traffic comes into an instance through one network interface and leaves through a different network interface, can reduce the peak performance that an instance can achieve if flows are tracked. For more information about security group connection tracking, untracked connections, and automatically tracked connections, see Amazon EC2 security group connection tracking.

Network drivers

Network drivers are updated and released on a regular basis. If your drivers are out of date, that can significantly impair performance. Keep your drivers up to date to ensure that you have the latest patches and can take advantage of performance improvements, such as the accelerated path feature that's only available for the latest generation of drivers. Earlier drivers don't support the accelerated path feature.

To take advantage of the accelerated path feature, we recommend that you install the latest ENA driver on your instances.

Linux instances – ENA Linux driver 2.2.9 or later. To install or update the ENA Linux driver from the Amazon Drivers GitHub repository, see the Driver compilation section of the readme file.

Windows instances – ENA Windows driver 2.0.0 or later. To install or update the ENA Windows driver, see Install the ENA driver on EC2 Windows instances.

Distance between endpoints

A connection between two instances in the same Availability Zone can process more packets per second than a connection across Regions as a result of TCP windowing at the application layer, which determines how much data can be in flight at any given time. Long distances between instances increase latency and decrease the number of packets that the endpoints can process.

Byte queue limit (BQL)

BQL is a feature that limits the number of bytes passed to the Nitro card to reduce queuing. BQL is disabled by default in ENA drivers, in Amazon Linux operating systems, and in most Linux distributions. If BQL and the fragment proxy override are both enabled, it can result in

performance limitations by restricting the number of bytes passed to Nitro before all fragments are processed.

Application design considerations

There are aspects of application design and configuration that can affect your processing efficiency. The following list includes some important considerations.

Packet size

Larger packet sizes can increase throughput for the data that an instance can send and receive on the network. Amazon EC2 supports jumbo frames of 9001 bytes, however other services may enforce different limits. Smaller packet sizes can increase the packet process rate, but this can reduce the maximum achieved bandwidth when the number of packets exceed PPS allowances.

If the size of a packet exceeds the Maximum Transmission Unit (MTU) of a network hop, a router along the path might fragment it. The resulting packet fragments are considered exceptions, and are normally processed at the standard rate (not accelerated). This can cause variations in your performance. However, you can override the standard behavior for outbound fragmented packets with the fragment proxy mode setting. For more information, see Maximize network performance on your Nitro system. We recommended that you evaluate your topology when you configure MTU.

Protocol trade-offs

Reliable protocols like TCP have more overhead than unreliable protocols like UDP. The lower overhead and simplified network processing for the UDP transport protocol can result in a higher PPS rate, but at the expense of reliable packet delivery. If reliable packet delivery isn't critical for your application, UDP might be a good option.

Micro-bursting

Micro-bursting occurs when traffic exceeds allowances during brief periods of time rather than being evenly distributed. This typically happens on a microsecond scale.

For example, say that you have an instance that can send up to 10 Gbps, and your application sends the full 10 Gb in half a second. This micro-burst exceeds the allowance during the first half second and leaves nothing for the remainder of the second. Even though you sent 10Gb in the 1 second timeframe, allowances in the first half second can result in packets being queued or dropped.

You can use a network scheduler such as Linux Traffic Control to help pace your throughput and avoid causing queued or dropped packets as a result of micro-bursting.

Number of flows

A single flow is limited to 5 Gbps unless it's inside of a cluster placement group that supports up to 10 Gbps, or if it uses ENA Express, which supports up to 25 Gbps.

Similarly, a Nitro card can process more packets across multiple flows as opposed to using a single flow. To achieve the peak packet processing rate per instance, we recommend at least 100 flows on instances with 100 Gbps or higher aggregate bandwidth. As aggregate bandwidth capabilities increase, the number of flows needed to achieve peak processing rates also increases. Benchmarking will help you determine what configuration you need to achieve peak rates on your network.

Elastic Network Adapter (ENA) queues

ENA (Elastic Network Adapter) uses multiple receive (Rx) and transmit (Tx) queues (ENA queues) to improve network performance and scalability on EC2 instances. These queues efficiently manage network traffic by load-balancing sent and received data across available queues.

For more information, see the section called “ENA queues”.

Feature process overhead

Features like Traffic Mirroring and ENA Express can add more processing overhead, which can reduce absolute packet processing performance. You can limit feature use or disable features to increase packet processing rates.

Connection tracking to maintain state

Your security groups use connection tracking to store information about traffic to and from the instance. Connection tracking applies rules against each individual flow of network traffic to determine if the traffic is allowed or denied. The Nitro card uses flow tracking to maintain state for the flow. As more security group rules are applied, more work is required to evaluate the flow.

> **Note**
>
> Not all network traffic flows are tracked. If a security group rule is configured with Untracked connections, no additional work is required except for connections that are

automatically tracked to ensure symmetric routing when there are multiple valid reply paths.

Packets that don't use hardware acceleration

Not all packets can take advantage of hardware acceleration. Handling these exceptions involves some processing overhead which is necessary to ensure the health of your network flows. Network flows must reliably meet protocol standards, conform to changes in the VPC design, and route packets only to allowed destinations. However, the overhead reduces your performance.

Packet fragments

As mentioned under **Application considerations**, packet fragments that result from packets that exceed network MTU are normally handled as exceptions, and can't take advantage of hardware acceleration. However, you can bypass egress fragment limitations with the fragment proxy mode, depending on your driver version. For more information, see actions you can take in the Maximize network performance on your Nitro system section.

Idle connections

When a connection has no activity for a while, even if the connection hasn't reached its timeout limit, the system can de-prioritize it. Then, if data comes in after the connection is de-prioritized, the system needs to handle it as an exception in order to reconnect.

To manage your connections, you can use connection tracking timeouts to close idle connections. You can also use TCP keepalives to keep idle connections open. For more information, see Idle connection tracking timeout.

VPC mutation

Updates to security groups, route tables, and access control lists all need to be reevaluated in the processing path to ensure that route entries and security group rules still apply as expected.

ICMP flows

Internet Control Message Protocol (ICMP) is a network layer protocol that network devices use to diagnose network communication issues. These packets always use the full flow.

Asymmetric L2 flows

NitroV3 and earlier platforms do not use hardware acceleration for traffic between two ENIs in the same subnet where one ENI is using the default gateway router and the other is not.

NitroV4 and later platforms use hardware acceleration in this scenario. For better performance on NitroV3 or earlier platforms, ensure that either the default gateway router used matches between both ENIs, or those ENIs are in different subnets.

Maximize network performance on your Nitro system

You can maximize your network performance on Nitro system by adjusting network settings.

Topics

- Considerations
- Tune PPS performance
- Configure ENA queue allocation
- Monitor performance on Linux instances

Considerations

Before you make any design decisions or adjust any network settings on your instance, we recommend that you take the following steps to help ensure that you have the best outcome:

1. Understand the pros and cons of the actions that you can take to improve performance by reviewing Network design considerations for the Nitro system.

   For more considerations and best practices for your instance configuration on Linux, see ENA Linux Driver Best Practices and Performance Optimization Guide on GitHub.
2. Benchmark your workloads with peak active flow count to determine a baseline for your application performance. With a performance baseline, you can test variations in your settings or application design to understand which considerations will have the most impact, especially if you plan to scale up or scale out.

Tune PPS performance

The following list contains actions that you can take to tune your PPS performance, depending on your system needs.

- Reduce the physical distance between two instances. When sending and receiving instances are located in same Availability Zone or use cluster placement groups, you can reduce the number of hops a packet needs to take to travel from one endpoint to another.

- Use Untracked connections.
- Use the UDP protocol for network traffic.
- For EC2 instances with aggregate bandwidth of 100 Gbps or more, distribute the workload over 100 or more individual flows to spread the work evenly across the Nitro card.
- To overcome the egress fragment PPS limit on EC2 instances, you can enable fragment proxy mode (depending on your driver version). This setting allows fragmented packets to be evaluated in the processing path, thereby overcoming the egress PPS limit of 1024. When loading the driver, run one of the following commands to enable or disable fragment proxy mode:

  Enable fragment proxy mode

  ```
  sudo insmod ena.ko enable_frag_bypass=1
  ```

  Disable fragment proxy mode

  ```
  sudo insmod ena.ko enable_frag_bypass=0
  ```

Configure ENA queue allocation

On supported instance types, you can dynamically allocate these queues across Elastic Network Interfaces (ENIs). Flexible ENA queue allocation optimizes resource distribution, enabling maximum vCPU utilization. High network performance workloads typically require multiple ENA queues. For more information, see ENA queues.

Monitor performance on Linux instances

You can use Ethtool metrics on Linux instances to monitor instance networking performance indicators such as bandwidth, packet rate, and connection tracking. For more information, see Monitor network performance for ENA settings on your EC2 instance.

Optimize network performance on EC2 Windows instances

To achieve the maximum network performance on your Windows instances with enhanced networking, you might need to modify the default operating system configuration. We recommend the following configuration changes for applications that require high network performance. Other optimizations (such as turning on checksum offloading and enabling RSS, for example) are already configured on official Windows AMIs.

> **Note**
>
> TCP chimney offloading should be disabled in most use cases, and has been deprecated as of Windows Server 2016.

In addition to these operating system optimizations, you should also consider the maximum transmission unit (MTU) of your network traffic, and adjust according to your workload and network architecture. For more information, see Network maximum transmission unit (MTU) for your EC2 instance.

AWS regularly measures average round trip latencies between instances launched in a cluster placement group of 50us and tail latencies of 200us at the 99.9 percentile. If your applications require consistently low latencies, we recommend using the latest version of the ENA drivers on fixed performance instances built on the Nitro System.

Configure Receive side scaling CPU affinity

Receive side scaling (RSS) is used to distribute network traffic CPU load across multiple processors. By default, the official Amazon Windows AMIs are configured with RSS enabled. ENA elastic network interfaces provide up to eight RSS queues. By defining CPU affinity for RSS queues, as well as for other system processes, it is possible to spread the CPU load out over multi-core systems, enabling more network traffic to be processed. On instance types with more than 16 vCPUs, we recommend that you use the `Set-NetAdapterRSS` PowerShell cmdlet, which manually excludes the boot processor (logical processor 0 and 1 when hyper-threading is enabled) from the RSS configuration for all elastic network interfaces, to prevent contention with various system components.

Windows is hyper-thread aware and ensures that the RSS queues of a single network interface card (NIC) are always placed on different physical cores. Therefore, unless hyper-threading is disabled, to completely prevent contention with other NICs, spread the RSS configuration of each NIC among a range of 16 logical processors. The `Set-NetAdapterRss` cmdlet allows you to define the per-NIC range of valid logical processors by defining the values of BaseProcessorGroup, BaseProcessorNumber, MaxProcessingGroup, MaxProcessorNumber, and NumaNode (optional). If there are not enough physical cores to completely eliminate inter-NIC contention, minimize the overlapping ranges or reduce the number of logical processors in the elastic network interface ranges depending on the expected workload of the interface (in other words, a low volume administrative network interface may not need as many RSS queues assigned). Also, as previously

noted, various components must run on CPU 0, and therefore we recommend excluding it from all RSS configurations when sufficient vCPUs are available.

For example, when there are three elastic network interfaces on a 72 vCPU instance with 2 NUMA nodes with hyper-threading enabled, the following commands spread the network load between the two CPUs without overlap and prevent the use of core 0 completely.

```
Set-NetAdapterRss -Name NIC1 -BaseProcessorGroup 0 -BaseProcessorNumber 2 -
MaxProcessorNumber 16
Set-NetAdapterRss -Name NIC2 -BaseProcessorGroup 1 -BaseProcessorNumber 0 -
MaxProcessorNumber 14
Set-NetAdapterRss -Name NIC3 -BaseProcessorGroup 1 -BaseProcessorNumber 16 -
MaxProcessorNumber 30
```

Note that these settings are persistent for each network adapter. If an instance is resized to one with a different number of vCPUs, you should reevaluate the RSS configuration for each enabled elastic network interface. The complete Microsoft documentation for the cmdlet can be found here: Set-NetAdapterRss.

Special note for SQL workloads: We also recommend that you review your I/O thread affinity settings along with your elastic network interface RSS configuration to minimize I/O and network contention for the same CPUs. See Server configuration: affinity mask.

Elastic Fabric Adapter for AI/ML and HPC workloads on Amazon EC2

An Elastic Fabric Adapter (EFA) is a network device that you can attach to your Amazon EC2 instance to accelerate Artificial Intelligence (AI), Machine Learning (ML), and High Performance Computing (HPC) applications. EFA enables you to achieve the application performance of an on-premises AI/ML or HPC cluster, with the scalability, flexibility, and elasticity provided by the AWS Cloud.

EFA provides lower and more consistent latency and higher throughput than the TCP transport traditionally used in cloud-based HPC systems. It enhances the performance of inter-instance communication that is critical for scaling AI/ML and HPC applications. It is optimized to work on the existing AWS network infrastructure and it can scale depending on application requirements.

EFA integrates with Libfabric, and it supports NVIDIA Collective Communications Library (NCCL), NVIDIA Inference Xfer Library (NIXL), and Expert Parallelism (EP) library for AI and ML applications,

and Open MPI 4.1 and later and Intel MPI 2019 Update 5 and later for HPC applications. NCCL and MPI integrate with Libfabric 1.7.0 and later. NIXL integrates with Libfabric 1.21.0 and later.

EFA supports RDMA (Remote Direct Memory Access) write on most supported instance types that have Nitro version 4 and later. RDMA read is supported on all instances with Nitro version 4 and later. GPUDirect RDMA (GDR) and GPUDirect Async (GDA) are available on select Nitro v4 and later instances. For more information, see Supported instance types.

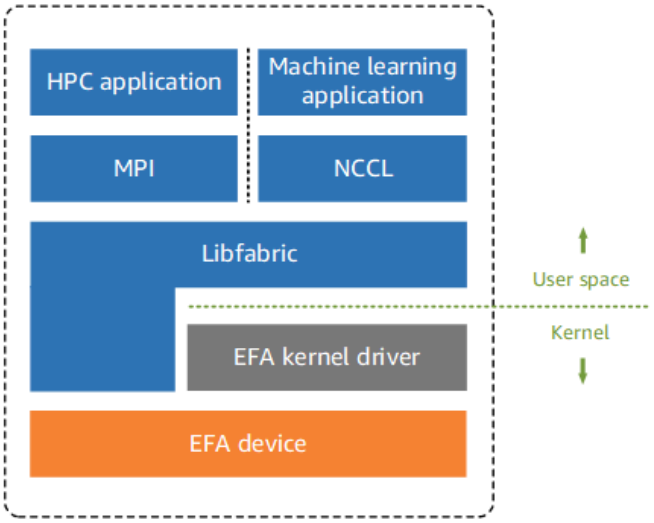
EFA basics



An EFA device can be attached to an EC2 instance in two ways:

1. Using a traditional EFA interface, also called EFA with ENA, which creates both an EFA device and an ENA device.
2. Using an EFA-only interface, which creates just the EFA device.

The EFA device provides capabilities like built-in OS-bypass and congestion control through the Scalable Reliable Datagram (SRD) protocol. The EFA device features enable low-latency, reliable transport functionality that allows EFA interface to provide better application performance for HPC and ML applications on Amazon EC2. While the ENA device offers traditional IP networking. For guidance on which instance configuration to use based on your use case, see Maximize network bandwidth.

Traditional HPC software stack in EC2

HPC software stack in EC2 with EFA

Traditionally, AI/ML applications use NCCL and NIXL (for disaggregated inference). HPC applications use the Message Passing Interface (MPI) to interface with the system's network transport. In the AWS cloud, this has meant that applications interface with NCCL, NIXL, or MPI, which then uses the operating system's TCP/IP stack and the ENA device driver to enable network communication between instances.

With a traditional EFA (EFA with ENA) or EFA-only interface, AI/ML applications use NCCL and NIXL (for disaggregated inference). HPC applications use MPI, to interface directly with the Libfabric API. The Libfabric API bypasses the operating system kernel and communicates directly with the EFA device to put packets on the network. This reduces overhead and enables AI/ML and HPC applications to run more efficiently.

Note

Libfabric is a core component of the OpenFabrics Interfaces (OFI) framework, which defines and exports the user-space API of OFI. For more information, see the Libfabric OpenFabrics website.

Differences between ENA, EFA, and EFA-only network interfaces

Amazon EC2 provides two types of network interfaces:

- **ENA** interfaces provide all of the traditional IP networking and routing features that are required to support IP networking for a VPC. For more information, see Enable enhanced networking with ENA on your EC2 instances.
- **EFA** (EFA with ENA) interfaces provide both the ENA device for IP networking and the EFA device for low-latency, high-throughput communication.
- **EFA-only** interfaces support only the EFA device capabilities, without the ENA device for traditional IP networking.

The following table provides a comparison of ENA, EFA, and EFA-only network interfaces.

	ENA	EFA (EFA with ENA)	EFA-only
Supports IP networking functionality	Yes	Yes	No
Can be assigned IPv4 or IPv6 addresses	Yes	Yes	No
Can be used as primary network interface for instance	Yes	Yes	No
Counts towards ENI attachment limit for instance	Yes	Yes	Yes

	ENA	EFA (EFA with ENA)	EFA-only
Instance type support	Supported on all Nitro-based instances types	Supported instance types	Supported instance types
Parameter naming in EC2 APIs	`interface`	`efa`	`efa-only`
Field naming in EC2 console	No selection	EFA with ENA	EFA-only

Supported interfaces and libraries

EFAs support the following interfaces and libraries:

- Open MPI 4.1 and later
- Intel MPI 2019 Update 5 and later
- AWS Neuron SDK version 2.3 and later

Supported instance types

To see the available instance types that support EFAs in a specific Region

The available instance types vary by Region. To see the available instance types that support EFAs in a Region, use the describe-instance-types command with the `--region` parameter. Include the `--filters` parameter to scope the results to the instance types that support EFA and the `--query` parameter to scope the output to the value of `InstanceType`.

```
aws ec2 describe-instance-types \
    --region eusc-de-east-1  \
    --filters Name=network-info.efa-supported,Values=true \
    --query "InstanceTypes[*].[InstanceType]"  \
    --output text | sort
```

Supported operating systems

EFA limitations

EFAs have the following limitations:

- RDMA write is not supported with all instance types. For more information, see Supported instance types.
- EFA traffic[1] between P4d/P4de/DL1 instances and other instance types is currently not supported.
- Instance types that support multiple network cards can be configured with one EFA per network card. All other supported instance types support only one EFA per instance.
- `c7g.16xlarge`, `m7g.16xlarge`, and `r7g.16xlarge` Dedicated Instances and Dedicated Hosts are not supported when an EFA is attached.
- EFA traffic[1] can't cross Availability Zones or VPCs. This does not apply to normal IP traffic from the ENA device of an EFA interface.
- EFA traffic[1] is not routable. Normal IP traffic from the ENA device of an EFA interface remains routable.
- EFA is not supported on AWS Outposts.
- The EFA device of an EFA (EFA with ENA) interface is supported on Windows instances only for AWS Cloud Digital Interface Software Development Kit (AWS CDI SDK) based applications. If you attach an EFA (EFA with ENA) interface to a Windows instance for non-CDI SDK based applications, it functions as an ENA interface, without the added EFA device capabilities. The EFA-only interface is not supported by AWS CDI based applications on Windows or Linux. For more information, see the AWS Cloud Digital Interface Software Development Kit (AWS CDI SDK) User Guide.

[1] *EFA traffic* refers to the traffic transmitted through the EFA device of either an EFA (EFA with ENA) or EFA-only interface.

EFA pricing

EFA is available as an optional Amazon EC2 networking feature that you can enable on any supported instance at no additional cost.

Get started with EFA and MPI for HPC workloads on Amazon EC2

This tutorial helps you to launch an EFA and MPI-enabled instance cluster for HPC workloads.

> **Note**
>
> The `u7i-12tb.224xlarge`, `u7in-16tb.224xlarge`, `u7in-24tb.224xlarge`, and `u7in-32tb.224xlarge` instances can run up to 128 parallel MPI processes with Open MPI or up to 256 parallel MPI processes with Intel MPI.

Tasks

- Step 1: Prepare an EFA-enabled security group
- Step 2: Launch a temporary instance
- Step 3: Install the EFA software
- Step 4: (Optional) Enable Open MPI 5
- Step 5: (Optional) Install Intel MPI
- Step 6: Disable ptrace protection
- Step 7. Confirm installation
- Step 8: Install your HPC application
- Step 9: Create an EFA-enabled AMI
- Step 10: Launch EFA-enabled instances into a cluster placement group
- Step 11: Terminate the temporary instance
- Step 12: Enable passwordless SSH

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure creates a security group that allows all inbound and outbound traffic to and from itself, and that allows inbound SSH traffic from any IPv4 address for SSH connectivity.

> **Important**
>
> This security group is intended for testing purposes only. For your production environments, we recommend that you create an inbound SSH rule that allows traffic only from the IP address from which you are connecting, such as the IP address of your computer, or a range of IP addresses in your local network.

For other scenarios, see Security group rules for different use cases.

To create an EFA-enabled security group

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
   a. For **Security group name**, enter a descriptive name for the security group, such as `EFA-enabled security group`.
   b. (Optional) For **Description**, enter a brief description of the security group.
   c. For **VPC**, select the VPC into which you intend to launch your EFA-enabled instances.
   d. Choose **Create security group**.
4. Select the security group that you created, and on the **Details** tab, copy the **Security group ID**.
5. With the security group still selected, choose **Actions**, **Edit inbound rules**, and then do the following:
   a. Choose **Add rule**.
   b. For **Type**, choose **All traffic**.
   c. For **Source type**, choose **Custom** and paste the security group ID that you copied into the field.
   d. Choose **Add rule**.
   e. For **Type**, choose **SSH**.
   f. For **Source type**, choose **Anywhere-IPv4**.
   g. Choose **Save rules**.
6. With the security group still selected, choose **Actions**, **Edit outbound rules**, and then do the following:

a. Choose **Add rule**.

b. For **Type**, choose **All traffic**.

c. For **Destination type**, choose **Custom** and paste the security group ID that you copied into the field.

d. Choose **Save rules**.

> **Important**
>
> The self-referencing inbound and outbound rules (allowing all traffic to and from the security group itself) are mandatory for EFA to function. Without these rules, EFA traffic between instances will be blocked.

Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**, and then choose **Launch Instances** to open the new launch instance wizard.
3. (*Optional*) In the **Name and tags** section, provide a name for the instance, such as `EFA-instance`. The name is assigned to the instance as a resource tag (`Name=EFA-instance`).
4. In the **Application and OS Images** section, select an AMI for one of the supported operating systems.
5. In the **Instance type** section, select a supported instance type.
6. In the **Key pair** section, select the key pair to use for the instance.
7. In the **Network settings** section, choose **Edit**, and then do the following:

   a. For **Subnet**, choose the subnet in which to launch the instance.

> **Important**
>
> You must select a subnet. If you do not select a subnet, you can't enable the instance for EFA.

b. For **Firewall (security groups)**, choose **Select existing security group**, and then select the security group that you created in the previous step.

c. Expand the **Advanced network configuration** section.

For **Network interface 1**, select **Network card index = 0**, **Device index = 0**, and **Interface type = EFA with ENA**.

(Optional) If you are using a multi-card instance type, such as `p4d.24xlarge` or `p5.48xlarge`, for each additional network interface required, choose **Add network interface**, for **Network card index** select the next unused index, and then select **Device index = 1** and **Interface type = EFA with ENA** or **EFA-only**.

8. In the **Storage** section, configure the volumes as needed.
9. In the **Summary** panel on the right, choose **Launch instance**.

> **Note**
>
> Consider requiring the use of IMDSv2 for the temporary instance as well as the AMI that you will create in Step 9 unless you have already set IMDSv2 as the default for the account. For more information about IMDSv2 configuration steps, see Configure instance metadata options for new instances.

Step 3: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, Libfabric, and Open MPI stack that is required to support EFA on your temporary instance.

The steps differ depending on whether you intend to use EFA with Open MPI, with Intel MPI, or with Open MPI and Intel MPI.

> **Note**
>
> Some operating systems might not be supported with Intel MPI. If you are using Intel MPI, refer to the Intel MPI documentation to verify support for your operating system.

To install the EFA software

1. Connect to the instance you launched. For more information, see Connect to your Linux instance using SSH.
2. To ensure that all of your software packages are up to date, perform a quick software update on your instance. This process may take a few minutes.

   - Amazon Linux 2023, RHEL 8/9, Rocky Linux 8/9

     ```
     $ sudo yum update -y
     ```

   - Ubuntu and Debian

     ```
     $ sudo apt-get update && sudo apt-get upgrade -y
     ```

   - SUSE Linux Enterprise

     ```
     $ sudo zypper update -y
     ```

3. Reboot the instance and reconnect to it.
4. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (`.tar.gz`) file. To download the latest *stable* version, use the following command.

   You can also get the latest version by replacing the version number with `latest` in the preceding command.
5. (*Optional*) Verify the authenticity and integrity of the EFA tarball (`.tar.gz`) file.

   We recommend that you do this to verify the identity of the software publisher and to check that the file has not been altered or corrupted since it was published. If you do not want to verify the tarball file, skip this step.

> **Note**
>
> Alternatively, if you prefer to verify the tarball file by using an MD5 or SHA256 checksum instead, see Verify the EFA installer using a checksum.

a. Download the public GPG key and import it into your keyring.

   The command should return a key value. Make a note of the key value, because you need it in the next step.

b. Verify the GPG key's fingerprint. Run the following command and specify the key value from the previous step.

```
$ gpg --fingerprint key_value
```

   The command should return a fingerprint that is identical to `4E90 91BC BB97 A96B 26B1 5E59 A054 80B1 DD2D 3CCC`. If the fingerprint does not match, don't run the EFA installation script, and contact Support.

c. Download the signature file and verify the signature of the EFA tarball file.

   The following shows example output.

```
gpg: Signature made Wed 29 Jul 2020 12:50:13 AM UTC using RSA key ID DD2D3CCC
gpg: Good signature from "Amazon EC2 EFA <ec2-efa-maintainers@amazon.com>"
gpg: WARNING: This key is not certified with a trusted signature!
gpg:          There is no indication that the signature belongs to the owner.
Primary key fingerprint: 4E90 91BC BB97 A96B 26B1  5E59 A054 80B1 DD2D 3CCC
```

   If the result includes `Good signature`, and the fingerprint matches the fingerprint returned in the previous step, proceed to the next step. If not, don't run the EFA installation script, and contact Support.

6. Extract the files from the compressed `.tar.gz` file and navigate into the extracted directory.
7. (*Optional*) Verify individual package signatures during installation.

   Starting with EFA installer 1.48.0, the installer includes GPG-signed individual RPM and DEB packages. To verify the authenticity and integrity of each individual package during installation, use the `--check-signatures` flag. When you enable this flag, the installer

verifies all package signatures first, and only proceeds with installation if every package passes verification. If any package fails verification, the installer exits immediately without installing anything.

a. Download the GPG public key.

```
$ wget https://efa-installer.amazonaws.com/aws-efa-installer.key
```

b. Export the key path. Then, in the next step, append `--check-signatures` to the installation command and use `sudo -E` instead of `sudo` to preserve the environment variable.

```
$ export EFA_INSTALLER_KEY=$(pwd)/aws-efa-installer.key
```

On RPM-based systems (Amazon Linux, RHEL, Rocky Linux, and SUSE), the installer verifies each RPM using `rpm --checksig`. On DEB-based systems (Ubuntu, Debian), the installer verifies each DEB using GPG signature verification.

If verification of any package fails, the installation immediately aborts, protecting your system against broken or malicious packages.

> **Note**
>
> The `--check-signatures` flag is optional. Without it, the installer does not perform individual signature verification.

8. Install the EFA software. Do one of the following depending on your use case.

> **Note**
>
> If you completed the previous optional step to set up package signature verification, append `--check-signatures` to the installation command and use `sudo -E` instead of `sudo`. For example: `sudo -E ./efa_installer.sh -y --check-signatures`.

> **Note**
>
> **EFA does not support NVIDIA GPUDirect with SUSE Linux**. If you are using SUSE Linux, you must additionally specify the `--skip-kmod` option to prevent kmod installation. By default, SUSE Linux does not allow out-of-tree kernel modules.

Open MPI and Intel MPI

If you intend to use EFA with Open MPI and Intel MPI, you must install the EFA software with Libfabric and Open MPI, and you **must complete Step 5: Install Intel MPI**.

To install the EFA software with Libfabric and Open MPI, run the following command.

> **Note**
>
> From EFA 1.30.0, both Open MPI 4.1 and Open MPI 5 are installed by default. You can optionally specify the version of Open MPI that you want to install. To install only Open MPI 4.1, include `--mpi=openmpi4`. To install only Open MPI 5, include `--mpi=openmpi5`. To install both, omit the `--mpi` option.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed to `/opt/amazon/efa`. Open MPI 4.1 is installed to `/opt/amazon/openmpi`. Open MPI 5 is installed to `/opt/amazon/openmpi5`.

Open MPI only

If you intend to use EFA with Open MPI only, you must install the EFA software with Libfabric and Open MPI, and you can **skip Step 5: Install Intel MPI**. To install the EFA software with Libfabric and Open MPI, run the following command.

> **Note**
>
> From EFA 1.30.0, both Open MPI 4.1 and Open MPI 5 are installed by default. You can optionally specify the version of Open MPI that you want to install. To install

only Open MPI 4.1, include `--mpi=openmpi4`. To install only Open MPI 5, include `--mpi=openmpi5`. To install both, omit the `--mpi` option.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed to `/opt/amazon/efa`. Open MPI 4.1 is installed to `/opt/amazon/openmpi`. Open MPI 5 is installed to `/opt/amazon/openmpi5`.

Intel MPI only

If you intend to use EFA with Intel MPI only, you can install the EFA software without Libfabric and Open MPI. In this case, Intel MPI uses its embedded Libfabric. If you choose to do this, you **must complete Step 5: Install Intel MPI**.

To install the EFA software without Libfabric and Open MPI, run the following command.

```
$ sudo ./efa_installer.sh -y --minimal
```

9. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.
10. Delete the uncompressed tarball and the tarball itself. Otherwise, these will be included in the EFA-enabled AMI that you create, increasing its size.

Step 4: (*Optional*) Enable Open MPI 5

Note

Perform this step only if you intend to use Open MPI 5.

From EFA 1.30.0, both Open MPI 4.1 and Open MPI 5 are installed by default. Alternatively, you can choose to install only Open MPI 4.1 or Open MPI 5.

If you chose to install Open MPI 5 in **Step 3: Install the EFA software**, and you intend to use it, you must perform the following steps to enable it.

To enable Open MPI 5

1. Add Open MPI 5 to the PATH environment variable.

   ```
   $ module load openmpi5
   ```

2. Verify that Open MPI 5 is enabled for use.

   ```
   $ which mpicc
   ```

   The command should return the Open MPI 5 installation directory - `/opt/amazon/openmpi5`.

3. (*Optional*) To ensure that Open MPI 5 is added to PATH environment variable each time the instance starts, do the following:

   bash shell

   Add `module load openmpi5` to `/home/`*`username`*`/.bashrc` and `/home/`*`username`*`/.bash_profile`.

   csh and tcsh shells

   Add `module load openmpi5` to `/home/`*`username`*`/.cshrc`.

If you need to remove Open MPI 5 from the PATH environment variable, run the following command and remove the command from the shell startup scripts.

```
$ module unload openmpi5
```

Step 5: (*Optional*) Install Intel MPI

> **Important**
>
> Perform this step only if you intend to use Intel MPI. If you intend to only use Open MPI, skip this step.

Intel MPI requires an additional installation and environment variable configuration.

Prerequisite

Ensure that the user performing the following steps has sudo permissions.

To install Intel MPI

1. To download the Intel MPI installation script, do the following

   a. Visit the Intel website.

   b. In the **Intel MPI Library** section of the webpage, choose the link for the **Intel MPI Library for Linux Offline** installer.

2. Run the installation script that you downloaded in the previous step.

   ```
   $ sudo bash installation_script_name.sh
   ```

3. In the installer, choose **Accept & install**.
4. Read the Intel Improvement Program, choose the appropriate option, and then choose **Begin Installation**.
5. When the installation completes, choose **Close**.
6. By default, Intel MPI uses its embedded (internal) Libfabric. You can configure Intel MPI to use the Libfabric that ships with the EFA installer instead. Typically, the EFA installer ships with a later version of Libfabric than Intel MPI. In some cases, the Libfabric that ships with the EFA installer is more performant than that of Intel MPI. To configure Intel MPI to use the Libfabric that ships with the EFA installer, do one of the following depending on your shell.

   bash shells

   Add the following statement to /home/*username*/.bashrc and /home/*username*/.bash_profile.

   ```
   export I_MPI_OFI_LIBRARY_INTERNAL=0
   ```

   csh and tcsh shells

   Add the following statement to /home/*username*/.cshrc.

   ```
   setenv I_MPI_OFI_LIBRARY_INTERNAL 0
   ```

7. Add the following **source** command to your shell script to source the `vars.sh` script from the installation directory to set up the compiler environment each time the instance starts. Do one of the following depending on your shell.

bash shells

Add the following statement to /home/*username*/.bashrc and /home/*username*/.bash_profile.

```
source /opt/intel/oneapi/mpi/latest/env/vars.sh
```

csh and tcsh shells

Add the following statement to /home/*username*/.cshrc.

```
source /opt/intel/oneapi/mpi/latest/env/vars.csh
```

8. By default, if EFA is not available due to a misconfiguration, Intel MPI defaults to the TCP/IP network stack, which might result in slower application performance. You can prevent this by setting I_MPI_OFI_PROVIDER to efa. This causes Intel MPI to fail with the following error if EFA is not available:

```
Abort (XXXXXX) on node 0 (rank 0 in comm 0): Fatal error in PMPI_Init: OtherMPI
 error,
MPIR_Init_thread (XXX).......:
MPID_Init (XXXX).............:
MPIDI_OFI_mpi_init_hook (XXXX):
open_fabric (XXXX)...........:
find_provider (XXXX).........:
OFI fi_getinfo() failed (ofi_init.c:2684:find_provider:
```

Do one of the following depending on your shell.

bash shells

Add the following statement to /home/*username*/.bashrc and /home/*username*/.bash_profile.

```
export I_MPI_OFI_PROVIDER=efa
```

csh and tcsh shells

Add the following statement to /home/*username*/.cshrc.

```
setenv I_MPI_OFI_PROVIDER efa
```

9. By default, Intel MPI doesn't print debugging information. You can specify different verbosity levels to control the debugging information. Possible values (in order of the amount of detail they provide) are: `0` (default), `1`, `2`, `3`, `4`, `5`. Level `1` and higher prints the `libfabric version` and `libfabric provider`. Use `libfabric version` to check whether Intel MPI is using the internal Libfabric or the Libfabric that ships with the EFA installer. If it's using the internal Libfabric, the version is suffixed with `impi`. Use `libfabric provider` to check with Intel MPI is using EFA or the TCP/IP network. If it's using EFA, the value is `efa`. If it's using TCP/IP, the value is `tcp;ofi_rxm`.

   To enable debugging information, do one of the following depending on your shell.

   bash shells

   Add the following statement to /home/*username*/.bashrc and /home/*username*/.bash_profile.

   ```
   export I_MPI_DEBUG=value
   ```

   csh and tcsh shells

   Add the following statement to /home/*username*/.cshrc.

   ```
   setenv I_MPI_DEBUG value
   ```

10. By default, Intel MPI uses the operating system's shared memory (`shm`) for intra-node communication, and it uses Libfabric (`ofi`) only for inter-node communication. Generally, this configuration provides the best performance. However, in some cases the Intel MPI shm fabric can cause certain applications to hang indefinitely.

    To resolve this issue, you can force Intel MPI to use Libfabric for both intra-node and inter-node communication. To do this, do one of the following depending on your shell.

    bash shells

    Add the following statement to /home/*username*/.bashrc and /home/*username*/.bash_profile.

```
export I_MPI_FABRICS=ofi
```

csh and tcsh shells

Add the following statement to /home/*username*/.cshrc.

```
setenv I_MPI_FABRICS ofi
```

> **Note**
>
> The EFA Libfabric provider uses the operating system's shared memory for intra-node communication. This means that setting `I_MPI_FABRICS` to `ofi` yields similar performance to the default `shm:ofi` configuration.

11. Log out of the instance and then log back in.

If you no longer want to use Intel MPI, remove the environment variables from the shell startup scripts.

Step 6: Disable ptrace protection

To improve your HPC application's performance, Libfabric uses the instance's local memory for interprocess communications when the processes are running on the same instance.

The shared memory feature uses Cross Memory Attach (CMA), which is not supported with *ptrace protection*. If you are using a Linux distribution that has ptrace protection enabled by default, such as Ubuntu, you must disable it. If your Linux distribution does not have ptrace protection enabled by default, skip this step.

To disable ptrace protection

Do one of the following:

- To temporarily disable ptrace protection for testing purposes, run the following command.

```
$ sudo sysctl -w kernel.yama.ptrace_scope=0
```

- To permanently disable ptrace protection, add `kernel.yama.ptrace_scope = 0` to `/etc/sysctl.d/10-ptrace.conf` and reboot the instance.

Step 7. Confirm installation

To confirm successful installation

1. To confirm that MPI was successfully installed, run the following command:

   ```
   $ which mpicc
   ```

   - For Open MPI, the returned path should include `/opt/amazon/`
   - For Intel MPI, the returned path should include `/opt/intel/`. If you do not get the expected output, ensure that you have sourced the Intel MPI `vars.sh` script.

2. To confirm that the EFA software components and Libfabric were successfully installed, run the following command.

   ```
   $ fi_info -p efa -t FI_EP_RDM
   ```

   The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

   ```
   provider: efa
       fabric: EFA-fe80::94:3dff:fe89:1b70
       domain: efa_0-rdm
       version: 2.0
       type: FI_EP_RDM
       protocol: FI_PROTO_EFA
   ```

Step 8: Install your HPC application

Install the HPC application on the temporary instance. The installation procedure varies depending on the specific HPC application. For more information, see Manage OS updates in the *Amazon Linux 2023 User Guide*.

Note

Refer to your HPC application's documentation for installation instructions.

Step 9: Create an EFA-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and choose **Actions**, **Image**, **Create image**.
4. For **Create image**, do the following:
   a. For **Image name**, enter a descriptive name for the AMI.
   b. (Optional) For **Image description**, enter a brief description of the purpose of the AMI.
   c. Choose **Create image**.
5. In the navigation pane, choose **AMIs**.
6. Locate the AMI that you created in the list. Wait for the status to change from `pending` to `available` before continuing to the next step.

Step 10: Launch EFA-enabled instances into a cluster placement group

Launch your EFA-enabled instances into a cluster placement group using the EFA-enabled AMI that you created in **Step 7**, and the EFA-enabled security group that you created in **Step 1**.

Note

- It is not an absolute requirement to launch your EFA-enabled instances into a cluster placement group. However, we do recommend running your EFA-enabled instances in a cluster placement group as it launches the instances into a low-latency group in a single Availability Zone.

- To ensure that capacity is available as you scale your cluster's instances, you can create a Capacity Reservation for your cluster placement group. For more information, see Use Capacity Reservations with placement groups.

To launch an instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**, and then choose **Launch Instances** to open the new launch instance wizard.
3. (*Optional*) In the **Name and tags** section, provide a name for the instance, such as `EFA-instance`. The name is assigned to the instance as a resource tag (`Name=EFA-instance`).
4. In the **Application and OS Images** section, choose **My AMIs**, and then select the AMI that you created in the previous step.
5. In the **Instance type** section, select a supported instance type.
6. In the **Key pair** section, select the key pair to use for the instance.
7. In the **Network settings** section, choose **Edit**, and then do the following:

   a. For **Subnet**, choose the subnet in which to launch the instance.

   > **Important**
   >
   > You must select a subnet. If you do not select a subnet, you can't enable the instance for EFA.

   b. For **Firewall (security groups)**, choose **Select existing security group**, and then select the security group that you created in the previous step.

   c. Expand the **Advanced network configuration** section.

   For **Network interface 1**, select **Network card index = 0**, **Device index = 0**, and **Interface type = EFA with ENA**.

   (*Optional*) If you are using a multi-card instance type, such as `p4d.24xlarge` or `p5.48xlarge`, for each additional network interface required, choose **Add network interface**, for **Network card index** select the next unused index, and then select **Device index = 1** and **Interface type = EFA with ENA** or **EFA-only**.

8. (*Optional*) In the **Storage** section, configure the volumes as needed.
9. In the **Advanced details** section, for **Placement group name**, select the cluster placement group into which to launch the instances. If you need to create a new cluster placement group, choose **Create new placement group**.
10. In the **Summary** panel on the right, for **Number of instances**, enter the number of EFA-enabled instances that you want to launch, and then choose **Launch instance**.

Step 11: Terminate the temporary instance

At this point, you no longer need the instance that you launched in Step 2. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions**, **Instance state**, **Terminate (delete) instance**.
4. When prompted for confirmation, choose **Terminate (delete)**.

Step 12: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

To enable passwordless SSH between the instances in the cluster

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable `strictHostKeyChecking` and enable `ForwardAgent` on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

```
Host *
    ForwardAgent yes
Host *
    StrictHostKeyChecking no
```

3. Generate an RSA key pair.

```
$ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
```

   The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
chmod 600 ~/.ssh/config
```

5. Open `~/.ssh/id_rsa.pub` using your preferred text editor and copy the key.
6. For each member node in the cluster, do the following:
   a. Connect to the instance.
   b. Open `~/.ssh/authorized_keys` using your preferred text editor and add the public key that you copied earlier.
7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

```
$ ssh member_node_private_ip
```

   You should connect to the member node without being prompted for a key or password.

Get started with EFA and NIXL for inference workloads on Amazon EC2

The NVIDIA Inference Xfer Library (NIXL) is a high-throughput, low-latency communication library designed specifically for disaggregated inference workloads. NIXL can be used together with EFA and Libfabric to support KV-cache transfer between prefill and decode nodes, and it enables efficient KV-cache movement between various storage layers. For more information, see the NIXL website.

Requirements

- Supported base AMIs: Amazon Linux 2023, Ubuntu 24.04, and Ubuntu 22.04.
- EFA supports only NIXL 1.0.0 and later.

Step 1: Prepare an EFA-enabled security group

An EFA requires a security group that allows all inbound and outbound traffic to and from the security group itself. The following procedure creates a security group that allows all inbound and outbound traffic to and from itself, and that allows inbound SSH traffic from any IPv4 address for SSH connectivity.

> **Important**
>
> This security group is intended for testing purposes only. For your production environments, we recommend that you create an inbound SSH rule that allows traffic only from the IP address from which you are connecting, such as the IP address of your computer, or a range of IP addresses in your local network.

For other scenarios, see Security group rules for different use cases.

To create an EFA-enabled security group

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Security Groups** and then choose **Create security group**.
3. In the **Create security group** window, do the following:
   a. For **Security group name**, enter a descriptive name for the security group, such as `EFA-enabled security group`.
   b. (Optional) For **Description**, enter a brief description of the security group.
   c. For **VPC**, select the VPC into which you intend to launch your EFA-enabled instances.
   d. Choose **Create security group**.
4. Select the security group that you created, and on the **Details** tab, copy the **Security group ID**.
5. With the security group still selected, choose **Actions**, **Edit inbound rules**, and then do the following:
   a. Choose **Add rule**.
   b. For **Type**, choose **All traffic**.
   c. For **Source type**, choose **Custom** and paste the security group ID that you copied into the field.
   d. Choose **Add rule**.

e. For **Type**, choose **SSH**.

f. For **Source type**, choose **Anywhere-IPv4**.

g. Choose **Save rules**.

6. With the security group still selected, choose **Actions**, **Edit outbound rules**, and then do the following:

a. Choose **Add rule**.

b. For **Type**, choose **All traffic**.

c. For **Destination type**, choose **Custom** and paste the security group ID that you copied into the field.

d. Choose **Save rules**.

> **Important**
>
> The self-referencing inbound and outbound rules (allowing all traffic to and from the security group itself) are mandatory for EFA to function. Without these rules, EFA traffic between instances will be blocked.

Step 2: Launch a temporary instance

Launch a temporary instance that you can use to install and configure the EFA software components. You use this instance to create an EFA-enabled AMI from which you can launch your EFA-enabled instances.

To launch a temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**, and then choose **Launch Instances** to open the new launch instance wizard.
3. (*Optional*) In the **Name and tags** section, provide a name for the instance, such as `EFA-instance`. The name is assigned to the instance as a resource tag (`Name=EFA-instance`).
4. In the **Application and OS Images** section, select an AMI for one of the supported operating systems. You can also select a supported DLAMI found on the DLAMI Release Notes Page.
5. In the **Instance type** section, select a supported instance type.

6. In the **Key pair** section, select the key pair to use for the instance.
7. In the **Network settings** section, choose **Edit**, and then do the following:

   a. For **Subnet**, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.

   b. For **Firewall (security groups)**, choose **Select existing security group**, and then select the security group that you created in the previous step.

   c. Expand the **Advanced network configuration** section.

      For **Network interface 1**, select **Network card index = 0**, **Device index = 0**, and **Interface type = EFA with ENA**.

      (*Optional*) If you are using a multi-card instance type, such as `p4d.24xlarge` or `p5.48xlarge`, for each additional network interface required, choose **Add network interface**, for **Network card index** select the next unused index, and then select **Device index = 1** and **Interface type = EFA with ENA** or **EFA-only**.

8. In the **Storage** section, configure the volumes as needed.

   > **Note**
   >
   > You must provision an additional 10 to 20 GiB of storage for the Nvidia CUDA Toolkit. If you do not provision enough storage, you will receive an `insufficient disk space` error when attempting to install the Nvidia drivers and CUDA toolkit.

9. In the **Summary** panel on the right, choose **Launch instance**.

> **Important**
>
> Skip Step 3 if your AMI already includes Nvidia GPU drivers, the CUDA toolkit, and cuDNN, or if you are using a non-GPU instance.

Step 3: Install NVIDIA GPU drivers, NVIDIA CUDA Toolkit, and cuDNN

Amazon Linux 2023

To install the NVIDIA GPU drivers, NVIDIA CUDA Toolkit, and cuDNN

1. To ensure that all of your software packages are up to date, perform a quick software update on your instance.

   ```
   $ sudo dnf upgrade -y && sudo reboot
   ```

   After the instance has rebooted, reconnect to it.

2. Install the utilities that are needed to install the NVIDIA GPU drivers and the NVIDIA CUDA Toolkit.

   ```
   $ sudo dnf groupinstall 'Development Tools' -y && sudo dnf install -y dkms
    kernel-devel-$(uname -r) kernel-headers-$(uname -r)
   ```

3. Disable the nouveau open source drivers.

   a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

      ```
      $ sudo yum install -y wget kernel-devel-$(uname -r) kernel-headers-$(uname -
      r)
      ```

   b. Add nouveau to the `/etc/modprobe.d/blacklist.conf` deny list file.

      ```
      $ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
      blacklist vga16fb
      blacklist nouveau
      blacklist rivafb
      blacklist nvidiafb
      blacklist rivatv
      EOF
      ```

   c. Append `GRUB_CMDLINE_LINUX="rdblacklist=nouveau"` to the `grub` file and rebuild the GRUB configuration.

      ```
      $ echo 'GRUB_CMDLINE_LINUX="rdblacklist=nouveau"' | sudo tee -a /etc/
      default/grub \
      ```

```
&& sudo grub2-mkconfig -o /boot/grub2/grub.cfg
```

4. Reboot the instance and reconnect to it.
5. Add the CUDA network repository.

```
$ sudo yum-config-manager --add-repo https://developer.download.nvidia.com/
compute/cuda/repos/rhel8/x86_64/cuda-rhel8.repo
```

6. Download and install the NVIDIA GPU driver.

```
$ wget https://us.download.nvidia.com/tesla/580.167.08/NVIDIA-Linux-
x86_64-580.167.08.run \
&& sudo sh NVIDIA-Linux-x86_64-580.167.08.run -m kernel-open --no-drm --disable-
nouveau --dkms --silent
```

7. Install the NVIDIA CUDA Toolkit and cuDNN.

```
$ sudo dnf install -y cuda-toolkit-13-0 libcudnn9-cuda-13 libcudnn9-devel-
cuda-13
```

8. Reboot the instance and reconnect to it.
9. Install and start the NVIDIA Fabric Manager on instances with NVSwitch, such as P-series multi-GPU instances. G-series instances do not use NVSwitch and do not require Fabric Manager.

```
$ sudo dnf install -y https://developer.download.nvidia.com/compute/cuda/repos/
rhel8/x86_64/nvidia-fabricmanager-580.167.08-1.el8.x86_64.rpm \
&& sudo systemctl enable nvidia-fabricmanager && sudo systemctl start nvidia-
fabricmanager
```

10. Ensure that the CUDA paths are set each time that the instance starts.
    - For *bash* shells, add the following statements to /home/*username*/.bashrc and /home/*username*/.bash_profile.

      ```
      export PATH=/usr/local/cuda/bin:$PATH
      export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/
      lib64:$LD_LIBRARY_PATH
      ```

    - For *tcsh* shells, add the following statements to /home/*username*/.cshrc.

```
setenv PATH /usr/local/cuda/bin:$PATH
setenv LD_LIBRARY_PATH /usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/
lib64:$LD_LIBRARY_PATH
```

11. To confirm that the NVIDIA GPU drivers are functional, run the following command.

```
$ nvidia-smi -q | head
```

The command should return information about the NVIDIA GPUs, NVIDIA GPU drivers, and NVIDIA CUDA Toolkit.

Ubuntu 24.04 and Ubuntu 22.04

To install the NVIDIA GPU drivers, NVIDIA CUDA Toolkit, and cuDNN

1. To ensure that all of your software packages are up to date, perform a quick software update on your instance.

```
$ sudo apt-get update && sudo apt-get upgrade -y
```

2. Install the utilities that are needed to install the NVIDIA GPU drivers and the NVIDIA CUDA Toolkit.

```
$ sudo apt-get update && sudo apt-get install build-essential -y
```

3. To use the NVIDIA GPU driver, you must first disable the nouveau open source drivers.

   a. Install the required utilities and the kernel headers package for the version of the kernel that you are currently running.

```
$ sudo apt-get install -y gcc make linux-headers-$(uname -r)
```

   b. Add nouveau to the `/etc/modprobe.d/blacklist.conf` deny list file.

```
$ cat << EOF | sudo tee --append /etc/modprobe.d/blacklist.conf
blacklist vga16fb
blacklist nouveau
blacklist rivafb
blacklist nvidiafb
```

```
blacklist rivatv
EOF
```

c. Open `/etc/default/grub` using your preferred text editor and add the following.

```
GRUB_CMDLINE_LINUX="rdblacklist=nouveau"
```

d. Rebuild the GRUB configuration.

```
$ sudo update-grub
```

4. Reboot the instance and reconnect to it.
5. Add the CUDA repository and install the NVIDIA GPU drivers, NVIDIA CUDA Toolkit, and cuDNN.

- Ubuntu 24.04

```
$ wget https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2404/
x86_64/cuda-keyring_1.1-1_all.deb \
&& sudo dpkg -i cuda-keyring_1.1-1_all.deb \
&& sudo add-apt-repository -y 'deb https://developer.download.nvidia.com/
compute/cuda/repos/ubuntu2404/x86_64 /' \
&& sudo apt-get update
```

```
$ sudo apt-get install -y nvidia-open-580 cuda-toolkit-13-0 libcudnn9-cuda-13
 libcudnn9-dev-cuda-13
```

- Ubuntu 22.04

```
$ wget https://developer.download.nvidia.com/compute/cuda/repos/ubuntu2204/
x86_64/cuda-keyring_1.1-1_all.deb \
&& sudo dpkg -i cuda-keyring_1.1-1_all.deb \
&& sudo DEBIAN_FRONTEND=noninteractive add-apt-repository -y "deb https://
developer.download.nvidia.com/compute/cuda/repos/ubuntu2204/x86_64/ /" \
&& sudo apt-get update
```

```
$ sudo apt-get install -y nvidia-open-580 cuda-toolkit-13-0 libcudnn9-cuda-13
 libcudnn9-dev-cuda-13
```

6. Reboot the instance and reconnect to it.

7. Install and start the NVIDIA Fabric Manager on instances with NVSwitch, such as P-series multi-GPU instances. G-series instances do not use NVSwitch and do not require Fabric Manager.

   - Ubuntu 24.04 and Ubuntu 22.04

   ```
   $ sudo apt-get install -y nvidia-fabricmanager-580 \
   && sudo systemctl enable nvidia-fabricmanager && sudo systemctl start nvidia-fabricmanager
   ```

8. Ensure that the CUDA paths are set each time that the instance starts.

   - For *bash* shells, add the following statements to /home/*username*/.bashrc and /home/*username*/.bash_profile.

   ```
   export PATH=/usr/local/cuda/bin:$PATH
   export LD_LIBRARY_PATH=/usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
   ```

   - For *tcsh* shells, add the following statements to /home/*username*/.cshrc.

   ```
   setenv PATH /usr/local/cuda/bin:$PATH
   setenv LD_LIBRARY_PATH /usr/local/cuda/lib64:/usr/local/cuda/extras/CUPTI/lib64:$LD_LIBRARY_PATH
   ```

9. To confirm that the NVIDIA GPU drivers are functional, run the following command.

   ```
   $ nvidia-smi -q | head
   ```

   The command should return information about the NVIDIA GPUs, NVIDIA GPU drivers, and NVIDIA CUDA Toolkit.

Important

Skip Step 4 if your AMI already includes GDRCopy, or if you are using a non-GPU instance.

Step 4: Install GDRCopy

Install GDRCopy to improve the performance of Libfabric on GPU-based platforms. For more information about GDRCopy, see the GDRCopy repository.

Amazon Linux 2023

To install GDRCopy

1. Install the required dependencies.

```
$ sudo yum -y install dkms rpm-build make check check-devel
```

2. Download and extract the GDRCopy package.

```
$ wget https://github.com/NVIDIA/gdrcopy/archive/refs/tags/v2.5.2.tar.gz \
&& tar xf v2.5.2.tar.gz && cd gdrcopy-2.5.2/packages
```

3. Build the GDRCopy RPM packages.

```
$ CUDA=/usr/local/cuda ./build-rpm-packages.sh
```

4. Install the GDRCopy RPM packages.

```
$ sudo rpm -Uvh gdrcopy-kmod-2.5.2*dkms*.rpm \
&& sudo rpm -Uvh gdrcopy-2.5.2*.rpm \
&& sudo rpm -Uvh gdrcopy-devel-2.5.2*.rpm
```

Ubuntu 24.04 and Ubuntu 22.04

To install GDRCopy

1. Install the required dependencies.

```
$ sudo apt-get install -y build-essential devscripts debhelper fakeroot pkg-
config dkms
```

> **Note**
>
> On Ubuntu 22.04 only, install these additional dependencies:

```
$ sudo apt-get install -y check libsubunit-dev
```

2. Download and extract the GDRCopy package, and build the packages.

```
$ wget https://github.com/NVIDIA/gdrcopy/archive/refs/tags/v2.5.2.tar.gz \
&& tar xf v2.5.2.tar.gz \
&& cd gdrcopy-2.5.2/packages \
&& CUDA=/usr/local/cuda ./build-deb-packages.sh
```

3. Install the GDRCopy DEB packages.

```
$ sudo dpkg -i gdrdrv-dkms_2.5.2-1_amd64.*.deb \
&& sudo dpkg -i libgdrapi_2.5.2-1_amd64.*.deb \
&& sudo dpkg -i gdrcopy-tests_2.5.2-1_amd64.*.deb \
&& sudo dpkg -i gdrcopy_2.5.2-1_amd64.*.deb
```

Important

Skip Step 5 if your AMI already includes the latest EFA installer.

Step 5: Install the EFA software

Install the EFA-enabled kernel, EFA drivers, and Libfabric stack that is required to support EFA on your instance.

To install the EFA software

1. Connect to the instance you launched. For more information, see Connect to your Linux instance using SSH.
2. Download the EFA software installation files. The software installation files are packaged into a compressed tarball (`.tar.gz`) file. To download the latest *stable* version, use the following command.

```
$ curl -O https://efa-installer.amazonaws.com/aws-efa-installer-1.50.0.tar.gz
```

3. Extract the files from the compressed `.tar.gz` file, delete the tarball, and navigate into the extracted directory.

```
$ tar -xf aws-efa-installer-1.50.0.tar.gz && rm -rf aws-efa-installer-1.50.0.tar.gz
 && cd aws-efa-installer
```

4. (*Optional*) Verify individual package signatures during installation.

   Starting with EFA installer 1.48.0, the installer includes GPG-signed individual RPM and DEB packages. To verify the authenticity and integrity of each individual package during installation, use the `--check-signatures` flag. When you enable this flag, the installer verifies all package signatures first, and only proceeds with installation if every package passes verification. If any package fails verification, the installer exits immediately without installing anything.

   a. Download the GPG public key.

      ```
      $ wget https://efa-installer.amazonaws.com/aws-efa-installer.key
      ```

   b. Export the key path. Then, in the next step, append `--check-signatures` to the installation command and use `sudo -E` instead of `sudo` to preserve the environment variable.

      ```
      $ export EFA_INSTALLER_KEY=$(pwd)/aws-efa-installer.key
      ```

   On RPM-based systems (Amazon Linux, RHEL, Rocky Linux, and SUSE), the installer verifies each RPM using `rpm --checksig`. On DEB-based systems (Ubuntu, Debian), the installer verifies each DEB using GPG signature verification.

   If verification of any package fails, the installation immediately aborts, protecting your system against broken or malicious packages.

   > **Note**
   >
   > The `--check-signatures` flag is optional. Without it, the installer does not perform individual signature verification.

5. Run the EFA software installation script.

> **Note**
>
> If you completed the previous optional step to set up package signature verification, append `--check-signatures` to the installation command and use `sudo -E` instead of sudo. For example: `sudo -E ./efa_installer.sh -y --check-signatures`.

```
$ sudo ./efa_installer.sh -y
```

Libfabric is installed in the `/opt/amazon/efa` directory.

6. If the EFA installer prompts you to reboot the instance, do so and then reconnect to the instance. Otherwise, log out of the instance and then log back in to complete the installation.
7. Confirm that the EFA software components were successfully installed.

```
$ fi_info -p efa -t FI_EP_RDM
```

The command should return information about the Libfabric EFA interfaces. The following example shows the command output.

- `p3dn.24xlarge` with single network interface

```
provider: efa
fabric: EFA-fe80::94:3dff:fe89:1b70
domain: efa_0-rdm
version: 2.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

- `p4d.24xlarge` and `p5.48xlarge` with multiple network interfaces

```
provider: efa
fabric: EFA-fe80::c6e:8fff:fef6:e7ff
domain: efa_0-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
provider: efa
fabric: EFA-fe80::c34:3eff:feb2:3c35
```

```
domain: efa_1-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
provider: efa
fabric: EFA-fe80::c0f:7bff:fe68:a775
domain: efa_2-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
provider: efa
fabric: EFA-fe80::ca7:b0ff:fea6:5e99
domain: efa_3-rdm
version: 111.0
type: FI_EP_RDM
protocol: FI_PROTO_EFA
```

Step 6: Install NIXL

Install NIXL. For more information about NIXL, see the NIXL repository.

Pre-built distributions

To install NIXL using PyPI

1. Install the required dependencies.
   - Amazon Linux 2023

     ```
     $ sudo dnf install -y python3.11 python3.11-pip
     ```

   - Ubuntu 24.04 and Ubuntu 22.04

     ```
     $ sudo apt install pip
     ```

2. Install NIXL.
   - Amazon Linux 2023

     ```
     $ pip3.11 install nixl
     ```

   - Ubuntu 24.04 and Ubuntu 22.04

```
$ pip install nixl
```

Build from source

To build and install NIXL from source

1. Install the required dependencies.

   - Amazon Linux 2023

   ```
   $ sudo dnf install -y cmake gcc-c++ git pkgconf-pkg-config ninja-build libaio-
   devel hwloc-devel numactl-devel python3-devel python3.11 python3.11-devel
    python3.11-pip \
   && sudo pip3.11 install meson ninja pybind11
   ```

   - Ubuntu 24.04 and Ubuntu 22.04

   ```
   $ sudo apt install cmake pkg-config meson pybind11-dev libaio-dev nvidia-cuda-
   toolkit pip libhwloc-dev \
   && pip install meson ninja pybind11
   ```

2. (Amazon Linux 2023 only) Create a `lib` symlink for the Libfabric installation. On Amazon Linux 2023, the EFA installer places the Libfabric libraries in `/opt/amazon/efa/lib64`, but the NIXL build expects them in `lib`.

   ```
   $ sudo ln -s /opt/amazon/efa/lib64 /opt/amazon/efa/lib
   ```

3. Navigate to your home directory.

   ```
   $ cd $HOME
   ```

4. Clone the official NIXL repository to the instance and navigate into the local cloned repository.

   ```
   $ sudo git clone https://github.com/ai-dynamo/nixl.git && cd nixl
   ```

5. Build and install NIXL and specify the path to the Libfabric installation directory.

```
$ sudo meson setup . nixl --prefix=/usr/local/nixl -Dlibfabric_path=/opt/amazon/
efa
$ cd nixl && sudo ninja && sudo ninja install
```

Step 7: Install NIXL Benchmark and test your EFA and NIXL configuration

Install the NIXL Benchmark and run a test to ensure that your temporary instance is properly configured for EFA and NIXL. The NIXL Benchmark enables you to confirm that NIXL is properly installed and that it is operating as expected. For more information, see the nixlbench repository.

NIXL Benchmark (nixlbench) requires ETCD for coordination between client and server. To use ETCD with NIXL requires ETCD Server and Client, and ETCD CPP API.

Build from Docker

To install and test NIXL Benchmark using Docker

1. Clone the official NIXL repository to the instance and navigate to the nixlbench build directory.

   ```
   $ git clone https://github.com/ai-dynamo/nixl.git
   $ cd nixl/benchmark/nixlbench/contrib
   ```

2. Build the container.

   ```
   $ ./build.sh
   ```

   For more information about Docker build options, see the nixlbench repository.

3. Install Docker.

   - Amazon Linux 2023

     ```
     $ sudo dnf install -y docker \
     && sudo systemctl enable --now docker
     ```

   - Ubuntu 24.04 and Ubuntu 22.04

     ```
     $ sudo apt install docker.io -y
     ```

4. Start the ETCD server for coordination.

```
$ docker run -d --name etcd-server \
    -p 2379:2379 -p 2380:2380 \
    quay.io/coreos/etcd:v3.5.18 \
    /usr/local/bin/etcd \
    --data-dir=/etcd-data \
    --listen-client-urls=http://0.0.0.0:2379 \
    --advertise-client-urls=http://0.0.0.0:2379 \
    --listen-peer-urls=http://0.0.0.0:2380 \
    --initial-advertise-peer-urls=http://0.0.0.0:2380 \
    --initial-cluster=default=http://0.0.0.0:2380
```

5. Validate that the ETCD server is running.

```
$ curl -L http://localhost:2379/health
```

Expected output:

```
{"health":"true"}
```

6. Open two terminals for the instance. On both terminals, run the following command to verify the installation. The command uses the ETCD server on the same instance, uses Libfabric as the backend, and operates using GPU memory.

```
$ docker run -it --gpus all --network host nixlbench:latest \
    nixlbench --etcd_endpoints http://localhost:2379 \
    --backend LIBFABRIC \
    --initiator_seg_type VRAM \
    --target_seg_type VRAM
```

Note

Use the value `DRAM` instead of `VRAM` for non-GPU instances.

Build from source

> **Important**
>
> Follow this tab only if you chose **Build from source** in Step 6.

To install NIXL Benchmark

1. Install the required system dependencies.

   - Amazon Linux 2023

     ```
     $ sudo dnf install -y gflags-devel
     ```

   - Ubuntu 24.04 and Ubuntu 22.04

     ```
     $ sudo apt install libgflags-dev
     ```

2. Install ETCD Server and Client.

   - Amazon Linux 2023 does not provide ETCD packages. Download the prebuilt release binaries and install them.

     ```
     $ ETCD_VER=v3.5.18 \
     && curl -L https://github.com/etcd-io/etcd/releases/download/${ETCD_VER}/etcd-
     ${ETCD_VER}-linux-amd64.tar.gz -o /tmp/etcd.tar.gz \
     && sudo mkdir -p /usr/local/etcd \
     && sudo tar -xzf /tmp/etcd.tar.gz -C /usr/local/etcd --strip-components=1 \
     && sudo ln -sf /usr/local/etcd/etcd /usr/local/bin/etcd \
     && sudo ln -sf /usr/local/etcd/etcdctl /usr/local/bin/etcdctl
     ```

   - Ubuntu 24.04 and Ubuntu 22.04

     ```
     $ sudo apt install -y etcd-server etcd-client
     ```

3. Install the ETCD CPP API.

   a. Install the required dependencies for ETCD CPP API.

      - Amazon Linux 2023

```
$ sudo dnf install -y boost-devel openssl-devel grpc-devel grpc-plugins
 protobuf-devel protobuf-compiler
```

- Ubuntu 24.04 and Ubuntu 22.04

```
$ sudo apt install libboost-all-dev libssl-dev libgrpc-dev libgrpc++-dev
 libprotobuf-dev protobuf-compiler-grpc libcpprest-dev
```

b. (Amazon Linux 2023 only) The C++ REST SDK (`cpprest`) isn't available in the Amazon Linux 2023 repositories, so build and install it from source.

```
$ cd $HOME
$ git clone https://github.com/microsoft/cpprestsdk.git
$ cd cpprestsdk
$ git submodule update --init
$ mkdir build && cd build
$ cmake .. -DCMAKE_BUILD_TYPE=Release -DBUILD_SHARED_LIBS=ON -DWERROR=OFF
$ sudo make -j$(nproc) && sudo make install
```

c. Clone and install ETCD CPP API.

```
$ cd $HOME
$ git clone https://github.com/etcd-cpp-apiv3/etcd-cpp-apiv3.git
$ cd etcd-cpp-apiv3
$ mkdir build && cd build
$ cmake ..
$ sudo make -j$(nproc) && sudo make install
```

4. Build and install nixlbench.

```
$ sudo meson setup . $HOME/nixl/benchmark/nixlbench -Dnixl_path=/usr/local/nixl/
$ sudo ninja && sudo ninja install
```

To test your EFA and NIXL configuration

1. Start the ETCD server on the instance.

```
$ etcd --listen-client-urls "http://0.0.0.0:2379" \
    --advertise-client-urls "http://localhost:2379" &
```

2. Validate that the ETCD server is running.

```
$ curl -L http://localhost:2379/health
```

Expected output:

```
{"health":"true"}
```

3. Open two terminals for the instance. On both terminals, complete the following steps to run nixlbench.

a. Navigate to the directory where nixlbench is installed.

```
$ cd /usr/local/nixlbench/bin/
```

b. Run the test and specify the backend, address of the ETCD server, and initiator segment type. The following command uses the ETCD server on the same instance, uses Libfabric as the backend, and operates using GPU memory. The environment variables configure the following:

- `NIXL_LOG_LEVEL=INFO` — Enables detailed debugging output. You can also specify `WARN` to receive only error messages.
- `LD_LIBRARY_PATH` — Sets the path for the NIXL library.

For more information about the NIXL Benchmark arguments, see the NIXLbench README in the official nixlbench repository.

```
$ export NIXL_LOG_LEVEL=INFO
$ export LD_LIBRARY_PATH=/usr/local/nixl/lib/$(gcc -dumpmachine):
$LD_LIBRARY_PATH

$ nixlbench --etcd-endpoints 'http://localhost:2379' \
    --backend 'LIBFABRIC' \
    --initiator_seg_type 'VRAM' \
    --target_seg_type 'VRAM'
```

On Amazon Linux 2023, NIXL installs its libraries in `lib64` instead. Set the library path as follows.

```
$ export LD_LIBRARY_PATH=/usr/local/nixl/lib64:/usr/local/nixl/lib64/
plugins:$LD_LIBRARY_PATH
```

> **Note**
>
> Use the value `DRAM` instead of `VRAM` for non-GPU instances.

Step 8: Install your machine learning applications

Install the machine learning applications on the temporary instance. The installation procedure varies depending on the specific machine learning application.

> **Note**
>
> Refer to your machine learning application's documentation for installation instructions.

Step 9: Create an EFA and NIXL-enabled AMI

After you have installed the required software components, you create an AMI that you can reuse to launch your EFA-enabled instances.

To create an AMI from your temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and choose **Actions**, **Image**, **Create image**.
4. For **Create image**, do the following:
   a. For **Image name**, enter a descriptive name for the AMI.
   b. (Optional) For **Image description**, enter a brief description of the purpose of the AMI.
   c. Choose **Create image**.
5. In the navigation pane, choose **AMIs**.
6. Locate the AMI that you created in the list. Wait for the status to change from `pending` to `available` before continuing to the next step.

Step 10: Terminate the temporary instance

At this point, you no longer need the temporary instance that you launched. You can terminate the instance to stop incurring charges for it.

To terminate the temporary instance

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the temporary instance that you created and then choose **Actions**, **Instance state**, **Terminate instance**.
4. When prompted for confirmation, choose **Terminate**.

Step 11: Launch EFA and NIXL-enabled instances

Launch your EFA and NIXL-enabled instances using the EFA-enabled AMI that you created in **Step 9**, and the EFA-enabled security group that you created in **Step 1**.

To launch EFA and NIXL-enabled instances

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**, and then choose **Launch Instances** to open the new launch instance wizard.
3. (*Optional*) In the **Name and tags** section, provide a name for the instance, such as `EFA-instance`. The name is assigned to the instance as a resource tag (`Name=EFA-instance`).
4. In the **Application and OS Images** section, choose **My AMIs**, and then select the AMI that you created in the previous step.
5. In the **Instance type** section, select a supported instance type.
6. In the **Key pair** section, select the key pair to use for the instance.
7. In the **Network settings** section, choose **Edit**, and then do the following:

    a. For **Subnet**, choose the subnet in which to launch the instance. If you do not select a subnet, you can't enable the instance for EFA.

    b. For **Firewall (security groups)**, choose **Select existing security group**, and then select the security group that you created in **Step 1**.

    c. Expand the **Advanced network configuration** section.

For **Network interface 1**, select **Network card index = 0**, **Device index = 0**, and **Interface type = EFA with ENA**.

(*Optional*) If you are using a multi-card instance type, such as `p4d.24xlarge` or `p5.48xlarge`, for each additional network interface required, choose **Add network interface**, for **Network card index** select the next unused index, and then select **Device index = 1** and **Interface type = EFA with ENA** or **EFA-only**.

8. (*Optional*) In the **Storage** section, configure the volumes as needed.
9. In the **Summary** panel on the right, for **Number of instances**, enter the number of EFA-enabled instances that you want to launch, and then choose **Launch instance**.

Step 12: Enable passwordless SSH

To enable your applications to run across all of the instances in your cluster, you must enable passwordless SSH access from the leader node to the member nodes. The leader node is the instance from which you run your applications. The remaining instances in the cluster are the member nodes.

To enable passwordless SSH between the instances in the cluster

1. Select one instance in the cluster as the leader node, and connect to it.
2. Disable `strictHostKeyChecking` and enable `ForwardAgent` on the leader node. Open `~/.ssh/config` using your preferred text editor and add the following.

```
Host *
    ForwardAgent yes
Host *
    StrictHostKeyChecking no
```

3. Generate an RSA key pair.

```
$ ssh-keygen -t rsa -N "" -f ~/.ssh/id_rsa
```

The key pair is created in the `$HOME/.ssh/` directory.

4. Change the permissions of the private key on the leader node.

```
$ chmod 600 ~/.ssh/id_rsa
```

```
chmod 600 ~/.ssh/config
```

5. Open `~/.ssh/id_rsa.pub` using your preferred text editor and copy the key.
6. For each member node in the cluster, do the following:
   a. Connect to the instance.
   b. Open `~/.ssh/authorized_keys` using your preferred text editor and add the public key that you copied earlier.
7. To test that the passwordless SSH is functioning as expected, connect to your leader node and run the following command.

   ```
   $ ssh member_node_private_ip
   ```

   You should connect to the member node without being prompted for a key or password.

> **Important**
>
> Follow Step 13 only if you followed Step 7.

Step 13: Test your EFA and NIXL configuration across instances

Run a test to ensure that your instances are properly configured for EFA and NIXL.

Build from Docker

To test your EFA and NIXL configuration across instances using Docker

1. Select two hosts to run the nixlbench benchmark. Use the IP address of the first host as the ETCD server IP for metadata exchange.
2. Start the ETCD server on host 1.

   ```
   $ docker run -d --name etcd-server \
       -p 2379:2379 -p 2380:2380 \
       quay.io/coreos/etcd:v3.5.18 \
       /usr/local/bin/etcd \
       --data-dir=/etcd-data \
       --listen-client-urls=http://0.0.0.0:2379 \
       --advertise-client-urls=http://0.0.0.0:2379 \
   ```

```
    --listen-peer-urls=http://0.0.0.0:2380 \
    --initial-advertise-peer-urls=http://0.0.0.0:2380 \
    --initial-cluster=default=http://0.0.0.0:2380
```

3. Validate that the ETCD server is running.

```
$ curl -L http://localhost:2379/health
```

```
{"health":"true"}
```

4. Run the nixlbench benchmark on host 1.

```
$ docker run -it --gpus all --network host nixlbench:latest \
    nixlbench --etcd_endpoints http://localhost:2379 \
    --backend LIBFABRIC \
    --initiator_seg_type VRAM
```

5. Run the nixlbench benchmark on host 2.

```
$ docker run -it --gpus all --network host nixlbench:latest \
    nixlbench --etcd_endpoints http://ETCD_SERVER_IP:2379 \
    --backend LIBFABRIC \
    --initiator_seg_type VRAM
```

Build from source

> **Important**
>
> Follow this tab only if you chose **Build from source** in Step 6.

To test your EFA and NIXL configuration across instances

1. Select two hosts to run the nixlbench benchmark. Use the IP address of the first host as the ETCD server IP for metadata exchange.
2. Launch the ETCD server on host 1.

```
$ etcd --listen-client-urls "http://0.0.0.0:2379" \
    --advertise-client-urls "http://localhost:2379" &
```

3. Validate that the ETCD server is running.

```
$ curl -L http://localhost:2379/health
```

```
{"health":"true"}
```

4. Run the nixlbench benchmark on host 1.

```
$ export NIXL_LOG_LEVEL=INFO
$ export LD_LIBRARY_PATH=$HOME/nixl/lib/x86_64-linux-gnu:$LD_LIBRARY_PATH

$ nixlbench \
    --etcd-endpoints http://localhost:2379 \
    --backend LIBFABRIC \
    --initiator_seg_type VRAM
```

On Amazon Linux 2023, NIXL installs its libraries in `lib64` instead. Set the library path as follows.

```
$ export LD_LIBRARY_PATH=/usr/local/nixl/lib64:/usr/local/nixl/lib64/plugins:
$LD_LIBRARY_PATH
```

5. Run the nixlbench benchmark on host 2.

```
$ export NIXL_LOG_LEVEL=INFO
$ export LD_LIBRARY_PATH=$HOME/nixl/lib/x86_64-linux-gnu:$LD_LIBRARY_PATH

$ nixlbench \
    --etcd-endpoints http://ETCD_SERVER_IP:2379 \
    --backend LIBFABRIC \
    --initiator_seg_type VRAM
```

On Amazon Linux 2023, NIXL installs its libraries in `lib64` instead. Set the library path as follows.

```
$ export LD_LIBRARY_PATH=/usr/local/nixl/lib64:/usr/local/nixl/lib64/plugins:
$LD_LIBRARY_PATH
```

Step 14: Test disaggregated inference serving over vLLM (*Optional*)

After NIXL is installed, you can use NIXL through LLM inference and serving frameworks such as vLLM, SGLang, and TensorRT-LLM.

To serve your inference workload using vLLM

1. Install vLLM.

```
$ pip install vllm
```

2. Start the vLLM server with NIXL. The following sample commands create one prefill (producer) and one decode (consumer) instance for NIXL handshake connection, KV connector, KV role, and transport backend. For detailed examples and scripts, see the NIXLConnector Usage Guide.

   To use NIXL with EFA, set the environment variables based on your setup and use case.

   - Producer (Prefiller) configuration

```
$ vllm serve your-application \
    --port 8200 \
    --enforce-eager \
    --kv-transfer-config
 '{"kv_connector":"NixlConnector","kv_role":"kv_both","kv_buffer_device":"cuda","kv_conne
{"backends":["LIBFABRIC"]}}'
```

   - Consumer (Decoder) configuration

```
$ vllm serve your-application \
    --port 8200 \
    --enforce-eager \
    --kv-transfer-config
 '{"kv_connector":"NixlConnector","kv_role":"kv_both","kv_buffer_device":"cuda","kv_conne
{"backends":["LIBFABRIC"]}}'
```

   The preceding sample configuration sets the following:

   - `kv_role` to `kv_both`, which enables symmetric functionality where the connector can act as both producer and consumer. This provides flexibility for experimental setups and scenarios where the role distinction is not predetermined.

- `kv_buffer_device` to `cuda`, which enables using GPU memory.
- NIXL backend to `LIBFABRIC`, which enables NIXL traffic to go over EFA.

Maximize network bandwidth on Amazon EC2 instances with multiple network cards

Many instances types that support EFA also have multiple network cards. For more information, see Network cards. If you plan to use EFA with one of these instance types, we recommend the following basic configuration:

- For the primary network interface (network card index `0`, device index `0`), create an ENA interface. You can't use an EFA-only network interface as the primary network interface.
- If the network card index 0 supports EFA, create an EFA-only network interface for network card index `0`, device index 1.
- For each additional network interface, use the next unused network card index, device index `0`, for EFA-only network interface, and/or device index 1 for ENA network interface depending on your usecase, such as ENA bandwidth requirements or IP address space. For example use cases, see EFA configuration for a P5 and P5e instances.

> **Note**
>
> P5 instances require network interfaces to be configured in a specific manner to enable maximum network bandwidth. For more information, see EFA configuration for a P5 and P5e instances.

The following examples show how to launch an instance based on these recommendations.

Instance launch

To specify EFAs during instance launch using the launch instance wizard

1. In the **Network settings** section, choose **Edit**.
2. Expand **Advanced network configuration**.
3. For the primary network interface (network card index `0`, device index `0`), create an ENA interface. You can't use an EFA-only network interface as the primary network interface.

4. If the network card index 0 supports EFA, create an EFA-only network interface for network card index `0`, device index 1.
5. For each additional network interface, use the next unused network card index, device index `0`, for EFA-only network interface, and/or device index 1 for ENA network interface depending on your usecase, such as ENA bandwidth requirements or IP address space. For example use cases, see EFA configuration for a P5 and P5e instances.

To specify EFAs during instance launch using the run-instances command

For `--network-interfaces`, specify the required number of network interfaces. For the primary network interface, specify `NetworkCardIndex=0`, `DeviceIndex=0`, and `InterfaceType=interface`. If the network card index 0 supports EFA, specify `NetworkCardIndex=0`, `DeviceIndex=1`, and `InterfaceType=efa-only`. For any additional network interfaces, for `NetworkCardIndex` specify the next unused index, `DeviceIndex=0` for `InterfaceType=efa-only`, and/or `DeviceIndex=1` for `InterfaceType=interface`.

The following example command snippet shows a request with 32 EFA devices and one ENA device.

```
$ aws ec2 run-instances \
 --instance-type p5.48xlarge \
 --count 1 \
 --key-name key_pair_name \
 --image-id ami-0abcdef1234567890 \
 --network-interfaces
 "NetworkCardIndex=0,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
 \
"NetworkCardIndex=0,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=1,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=2,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=3,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=4,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=5,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=6,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
```

```
"NetworkCardIndex=7,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=8,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=9,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=
only" \
"NetworkCardIndex=10,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=11,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=12,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=13,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=14,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=15,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=16,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=17,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=18,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=19,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=20,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=21,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=22,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=23,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=24,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=25,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=26,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=27,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=28,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
```

```
"NetworkCardIndex=29,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=30,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only" \
"NetworkCardIndex=31,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType
only"
...
```

Launch templates

To add EFAs to a launch template using the Amazon EC2 console

1. In the **Network settings** section, expand **Advanced network configuration**.
2. For the primary network interface (network card index `0`, device index `0`), create an ENA interface. You can't use an EFA-only network interface as the primary network interface.
3. If the network card index 0 supports EFA, create an EFA-only network interface for network card index `0`, device index 1.
4. For each additional network interface, use the next unused network card index, device index `0`, for EFA-only network interface, and/or device index 1 for ENA network interface depending on your usecase, such as ENA bandwidth requirements or IP address space. For example use cases, see EFA configuration for a P5 and P5e instances.

To add EFAs to a launch template using the create-launch-template command

For `NetworkInterfaces`, specify the required number of network interfaces. For the primary network interface, specify `NetworkCardIndex=0`, `DeviceIndex=0`, and `InterfaceType=interface`. If the network card index 0 supports EFA, specify `NetworkCardIndex=0`, `DeviceIndex=1`, and `InterfaceType=efa-only`. For any additional network interfaces, for `NetworkCardIndex` specify the next unused index, `DeviceIndex=0` for `InterfaceType=efa-only`, and/or `DeviceIndex=1` for `InterfaceType=interface`.

The following snippet shows an example with 3 network interfaces out of the possible 32 network interfaces.

```
"NetworkInterfaces":[
{
  "NetworkCardIndex":0,
  "DeviceIndex":0,
  "InterfaceType": "interface",
```

```
  "AssociatePublicIpAddress":false,
  "Groups":[
    "security_group_id"
  ],
  "DeleteOnTermination":true
},
{
  "NetworkCardIndex": 0,
  "DeviceIndex": 1,
  "InterfaceType": "efa-only",
  "AssociatePublicIpAddress":false,
  "Groups":[
    "security_group_id"
  ],
  "DeleteOnTermination":true
},
{
  "NetworkCardIndex": 1,
  "DeviceIndex": 0,
  "InterfaceType": "efa-only",
  "AssociatePublicIpAddress":false,
  "Groups":[
    "security_group_id"
  ],
  "DeleteOnTermination":true
},
{

EFA configuration for a P5 and P5e instances

`p5.48xlarge` and `p5e.48xlarge` instances support 32 network cards and have a total network bandwidth capacity of 3,200 Gbps, of which up to 800 Gbps can be used for IP network traffic. Because EFA and IP network traffic share the same underlying resources, bandwidth used by one will reduce the bandwidth that is available to the other. This means that you can distribute the network bandwidth between EFA traffic and IP traffic in any combination, as long as the total bandwidth does not exceed 3,200 Gbps and IP bandwidth does not exceed 800 Gbps. For example, if you use 400 Gbps for IP bandwidth, you can achieve up to 2,800 Gbps of EFA bandwidth at the same time.

Use case 1: Save IP addresses and avoid potential Linux IP issues

This configuration provides up to 3200 Gbps of EFA networking bandwidth and up to 100 Gbps of IP networking bandwidth with one private IP address. This configuration also helps to avoid potential Linux IP issues, such as disallowed auto-assignment of public IP addresses and IP routing challenges (hostname to IP address mapping issues and source IP address mismatches), that can arise if an instance has multiple network interfaces.

- For the primary network interface (network card index 0, device index 0), use an ENA interface.
- For network card index 0, device index 1, create an EFA-only network interface.
- For the remaining network interfaces (network card indexes 1-31, device index 0), use EFA-only network interfaces.

Use case 2: Maximum EFA and IP network bandwidth

This configuration provides up to 3200 Gbps of EFA networking bandwidth and up to 800 Gbps of IP networking bandwidth with 8 private IP address. You can't auto-assign public IP addresses with this configuration. However, you can attach an Elastic IP address to the primary network interface (network card index 0, device index 0) after launch for internet connectivity.

- For the primary network interface (network card index 0, device index 0), use an ENA network interface.
- For the remaining interfaces, do the following:

- Specify EFA-only network interfaces on network card index 0 device index 1, and for network card indexes 1, 2, and 3, use device index 0.
- Specify one ENA network interface and four EFA-only network interfaces **in each** of the following network card index subsets, and use device index 1 for ENA network interface and device index 0 for EFA-only network interfaces:
  - [4,5,6,7]
  - [8,9,10,11]
  - [12,13,14,15]
  - [16,17,18,19]
  - [20,21,22,23]
  - [24,25,26,27]
  - [28,29,30,31]

The following example illustrates this configuration:

```
$ aws --region $REGION ec2 run-instances \
 --instance-type p5.48xlarge \
 --count 1 \
 --key-name key_pair_name \
 --image-id ami_id \
 --network-interfaces
 "NetworkCardIndex=0,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=0,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=1,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=2,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \

"NetworkCardIndex=14,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=15,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=16,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=16,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=17,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=18,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=19,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=20,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=20,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=21,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=22,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=23,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
```

```
"NetworkCardIndex=24,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=24,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=25,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=26,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=27,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=28,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=28,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=29,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=30,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=31,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only"
...
```

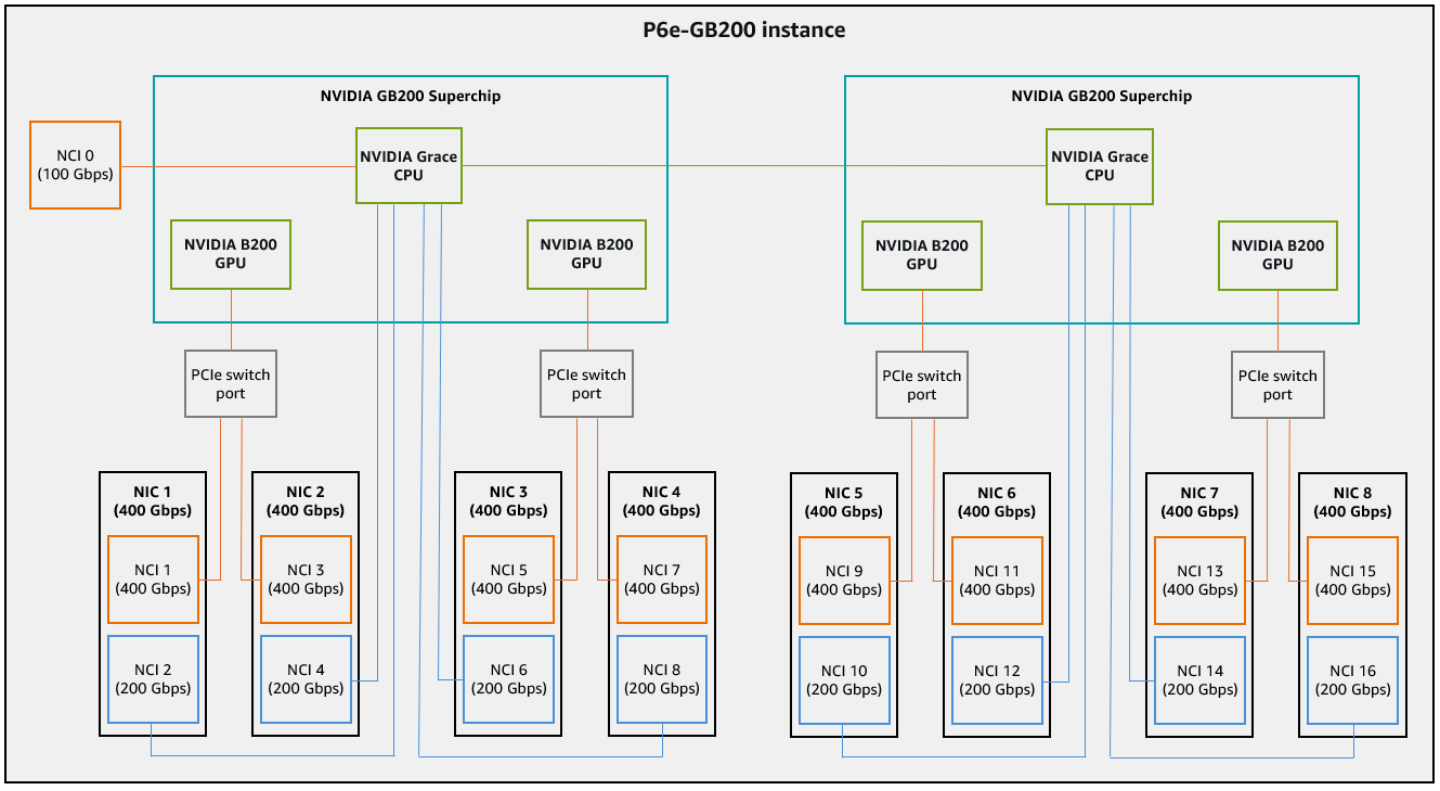
EFA configuration for a P6-B200 instances

P6-B200 instances have a total network bandwidth capacity of 3,200 Gbps, of which up to 1600 Gbps can be used for ENA. They have 8 GPUs and 8 network cards, where each network card supports up to 400 Gbps EFA bandwidth and 200 Gbps ENA bandwidth. Since EFA and ENA traffic share the same underlying resources, bandwidth used by one will reduce the bandwidth that is available to the other.

Use case 1: Save IP addresses

This configuration consumes at least one private IP address per instance and supports up to 3200 Gbps of EFA bandwidth and 200 Gbps of ENA bandwidth.

- For the primary network interface (network card index 0, device index 0), use an ENA interface.
- For network card index 0, device index 1, create an EFA-only network interface.
- For the remaining 7 network cards (network card indexes 1-7, device index 0), use EFA-only network interfaces.



Use case 2: Maximum EFA and ENA bandwidth

This configuration consumes at least 8 private IP address per instance and supports up to 3200 Gbps of EFA bandwidth and 1600 Gbps of ENA bandwidth.

- For the primary network interface (network card index 0, device index 0), use an ENA interface.
- For network card index 0, device index 1, create an EFA-only network interface.
- For the remaining 7 network cards (network card indexes 1-7), create an EFA-only network interface on device index 0 and an ENA network interface on device index 1.

EFA configuration for a P6e-GB200 instances

P6e-GB200 instances can be configured with up to 17 network cards. The following image shows the physical network interface card (NIC) layout for P6e-GB200 instances, along with the mapping of network card indexes (NCIs).

The primary NCI (index 0) supports up to 100 Gbps of ENA bandwidth. NCIs with the following indexes support EFA-only network interfaces and 400 Gbps EFA bandwidth: [1, 3, 5, 7, 9, 11, 13, 15]. NCIs with the following indexes support up to 200 Gbps ENA or EFA bandwidth: [2, 4, 6, 8, 10, 12, 14, 16].

The NCIs in the following groups share an underlying physical NIC on the host:

- [1 and 2]
- [3 and 4]
- [5 and 6]
- [7 and 8]
- [9 and 10]
- [11 and 12]
- [13 and 14]
- [15 and 16]

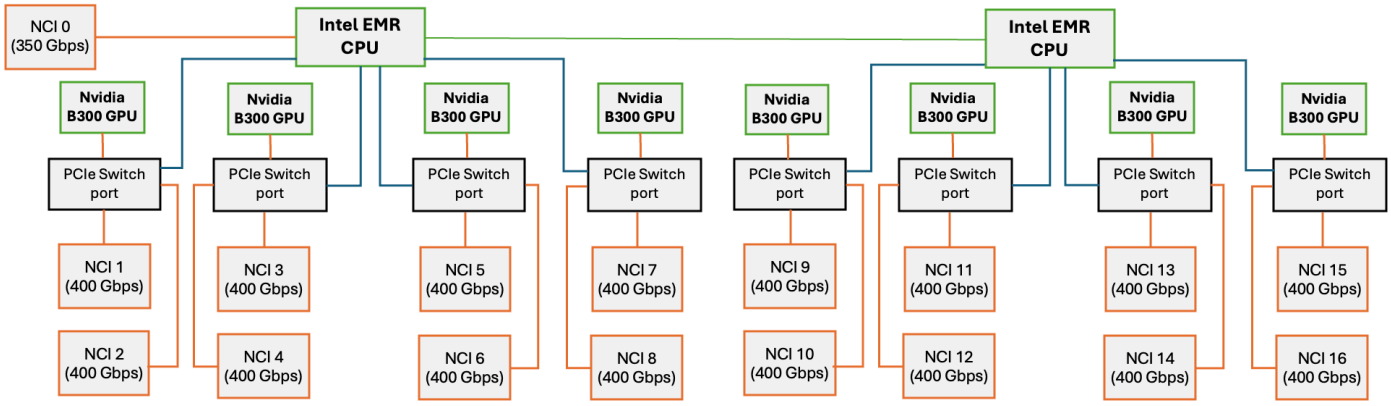
Each physical NIC supports up 400 Gbps of bandwidth. Because the NCIs in these groups share the same underlying physical NIC, bandwidth used by one will reduce the bandwidth that is available to the other. For example, if NCI 2 uses 200 Gbps of ENA bandwidth, NCI 1 can use up to 200 Gbps of EFA bandwidth at the same time.

Each underlying GPU on the host can send traffic directly over the following pairs of NCIs:

- [1 and 3]
- [5 and 7]
- [9 and 11]
- [13 and 15]

Each GPU supports up to 400 Gbps of EFA bandwidth. Because the network cards in these groups share the same GPU, bandwidth used by one will reduce the bandwidth that is available to the other. For example, if NCI 1 uses 200 Gbps of EFA bandwidth, NCI 3 can use up to 200 Gbps of EFA bandwidth at the same time. Therefore, to achieve maximum EFA performance, we recommend that you do **one of the following** to achieve a total of 1,600 Gbps EFA bandwidth:

- Add an EFA-only network interface to only one NCI in each group to achieve 400 Gbps per network interface (*4 EFA network interfaces x 400 Gbps*).
- Add an EFA-only network interface to each NCI in each group to achieve 200 Gbps per network interface (*8 EFA network interfaces x 200 Gbps*).



For example, the following configuration provides up to 1,600 Gbps of EFA bandwidth using a single EFA-only network interface in each NCI group, and up to 100 Gbps of ENA networking bandwidth using only the primary NCI (index 0).

- For the primary NCI (network card index 0, device index 0), use an ENA network interface.
- Add EFA-only network interfaces to the following:
  - NCI 1, device index 0
  - NCI 5, device index 0
  - NCI 9, device index 0
  - NCI 13, device index 0

EFA configuration for a P6-B300 instances

P6-B300 instances have a total network bandwidth capacity of up to 6400 Gbps for EFA traffic, and up to 3870 Gbps for ENA traffic. They have 8 GPUs and 17 network cards, where the primary network card supports only an ENA network interface with up to 350 Gbps of bandwidth. The secondary network cards support up to 400 Gbps EFA and up to 220 Gbps of ENA bandwidth. Since EFA and ENA traffic share the same underlying resources, bandwidth used by one will reduce the bandwidth that is available to the other.

P6-B300 instance

Use case 1: Save IP addresses

This configuration consumes at least one private IP address per instance and supports up to 6400 Gbps of EFA bandwidth and up to 350 Gbps of ENA bandwidth.

- For the primary network interface (network card index 0, device index 0), use an ENA network interface.
- For the remaining network cards (network card indexes 1-16, device index 0), use EFA-only network interfaces.

```
--network-interfaces \
"NetworkCardIndex=0,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=1,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=2,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=3,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=4,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=5,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=6,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=7,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=8,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=9,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=10,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=11,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=12,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=13,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=14,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=15,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=16,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only"
```

Use case 2: Maximum EFA and ENA bandwidth

This configuration consumes at least 17 private IP address per instance and supports up to 6400 Gbps of EFA bandwidth and up to 3870 Gbps of ENA bandwidth.

- For the primary network interface (network card index 0, device index 0) use an ENA network interface.
- For the remaining network cards, create an EFA-only interface (network card indexes 1-16 device index 0) and an ENA interface network card indexes 1-16 device index 1).

```
--network-interfaces \
"NetworkCardIndex=0,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=1,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=2,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=3,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=4,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=5,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=6,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=7,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=8,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=9,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=efa
only" \
"NetworkCardIndex=10,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=11,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=12,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=13,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=14,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
```

```
"NetworkCardIndex=15,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=16,DeviceIndex=0,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=ef
only" \
"NetworkCardIndex=1,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=2,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=3,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=4,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=5,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=6,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=7,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=8,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=9,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=int
 \
"NetworkCardIndex=10,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=11,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=12,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=13,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=14,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=15,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
 \
"NetworkCardIndex=16,DeviceIndex=1,Groups=security_group_id,SubnetId=subnet_id,InterfaceType=in
```

Install the EFA software in a container

This section covers how to use the EFA installer in a containerized environment. You can install the EFA software either by adding commands to a Dockerfile or by running them directly in the shell of a running container.

To install EFA software in a container using shell commands

1. Update the operating system packages. This step ensures that you have the latest packages.

   - For Debian-based operating systems:

     ```
     apt-get update && apt-get upgrade -y
     ```

   - For RHEL-based operating systems:

     ```
     yum update -y
     ```

2. Download the EFA installer. We recommend that you use the latest EFA installer. For information about the latest version, see Elastic Fabric Adapter release notes.

   ```
   mkdir /tmp/efa \
   && cd /tmp/efa \
   && curl -O https://efa-installer.amazonaws.com/aws-efa-installer-version.tar.gz
   ```

   (Optional) Verify the signature of the EFA installer package.

   ```
   wget https://efa-installer.amazonaws.com/aws-efa-installer.key \
   && gpg --import aws-efa-installer.key \
   && cat aws-efa-installer.key | gpg --fingerprint \
   && wget https://efa-installer.amazonaws.com/aws-efa-installer-version.tar.gz.sig \
   && gpg --verify ./aws-efa-installer-version.tar.gz.sig
   ```

3. Install the EFA software. The following command uses these arguments:

   - `--skip-kmod` — Skips kernel module installation. The container environment can't modify kernel modules.
   - `--skip-limit-conf` — Skips the limits configuration. You can't set `ulimit` inside a container. Configure this as part of the container creation instead.
   - `--no-verify` — Skips EFA device detection. The device detection uses `lspci`, which doesn't work in a containerized environment.

   ```
   tar -xf aws-efa-installer-version.tar.gz \
   && cd aws-efa-installer \
   && ./efa_installer.sh -y --skip-kmod --skip-limit-conf --no-verify
   ```

> **Note**
>
> For NGC containers, with EFA installer version 1.49.0 or later you can use the `--enable-ngc` flag instead of the three flags above. This flag handles all container-specific configuration automatically:
>
> ```
> ./efa_installer.sh -y --enable-ngc
> ```

4. Clean up the temporary installation files.

```
rm -rf /tmp/efa
```

Create and attach an Elastic Fabric Adapter to an Amazon EC2 instance

You can create an EFA and attach it to an Amazon EC2 instance much like any other elastic network interface in Amazon EC2. However, unlike elastic network interfaces, EFAs can't be attached to or detached from an instance in a `running` state.

Considerations

- You can change the security group that is associated with an EFA. To enable OS-bypass functionality, the EFA must be a member of a security group that allows all inbound and outbound traffic to and from the security group itself. For more information, see Step 1: Prepare an EFA-enabled security group.

  You change the security group that is associated with an EFA in the same way that you change the security group that is associated with an elastic network interface. For more information, see the section called “Modify network interface attributes”.
- You assign an Elastic IP (IPv4) and IPv6 address to an EFA (EFA with ENA) network interface in the same way that you assign an IP address to an elastic network interface. For more information, see Managing IP addresses.

  You can't assign an IP address to an EFA-only network interface.

Tasks

- Create an EFA

- Attach an EFA to a stopped instance
- Attach an EFA when launching an instance
- Add an EFA to a launch template

Create an EFA

You can create an EFA in a subnet in a VPC. You can't move the EFA to another subnet after it's created, and you can only attach it to stopped instances in the same Availability Zone.

Console

To create an EFA (EFA with ENA or ENA-only) network interface

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Network Interfaces** and then choose **Create network interface**.
3. For **Description**, enter a descriptive name for the EFA.
4. For **Subnet**, select the subnet in which to create the EFA.
5. **Interface type**, choose one of the following options:
   - **EFA with ENA** — To create a network interface that supports both ENA and EFA devices.
   - **EFA-only** — To create a network interface with an EFA device only.
6. (For EFA with ENA only) Configure the IP address and prefix assignment for the network interface. The type of IP addresses and prefixes you can assign depend on the selected subnet. For IPv4-only subnets, you can assign IPv4 IP addresses and prefixes only. For IPv6-only subnets, you can assign IPv6 IP addresses and prefixes only. For dual-stack subnets, you can assign both IPv4 and IPv6 IP addresses and prefixes.

   > **Note**
   >
   > You can't assign IP addresses to an EFA-only network interface.

   a. For **Private IPv4 address** and/or **IPv6 address**, choose **Auto-assign** to have Amazon EC2 automatically assign an IP address from the selected subnet, or choose **Custom** to manually specify the IP address to assign.

b. If you assign an IPv6 address, you can optionally enable **Assign primary IPv6 IP**. Doing this assigns a primary IPv6 global unicast address (GUA) to the network interface. Assigning a primary IPv6 address enables you to avoid disrupting traffic to instances or ENIs. For more information, see IPv6 addresses.

c. For **IPv4 prefix delegation** and/or **IPv6 prefix delegation**, choose **Auto-assign** to have Amazon EC2 automatically assign a prefix from the subnet's CIDR block, or choose **Custom** to manually specify a prefix from the subnet's CIDR block. If you specify a prefix, AWS verifies that it is not already assigned to another resource. For more information, see Prefix delegation for Amazon EC2 network interfaces

d. (Optional) Configure the **Idle connection tracking timeout** settings. For more information, see Idle connection tracking timeout

- **TCP established timeout** — The timeout period, in seconds, for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 432000 seconds. Recommended: Less than 432000 seconds.
- **UDP timeout** — The timeout period, in seconds, for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.
- **UDP stream timeout** — The timeout period, in seconds, for idle UDP flows classified as streams that have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

7. For **Security groups**, select one or more security groups.
8. Choose **Create network interface**.

AWS CLI

To create an EFA

Use the create-network-interface command. For `--interface-type`, specify `efa` for an EFA network interface or `efa-only` for an EFA-only network interface.

```
aws ec2 create-network-interface \
    --subnet-id subnet-0abcdef1234567890 \
    --interface-type efa \
    --description "my efa"
```

PowerShell

To create an EFA

Use the New-EC2NetworkInterface cmdlet. For `-InterfaceType`, specify `efa` for an EFA network interface or `efa-only` for an EFA-only network interface

```
New-EC2NetworkInterface `
    -SubnetId subnet-0abcdef1234567890 `
    -InterfaceType efa `
    -Description "my efa"
```

Attach an EFA to a stopped instance

You can attach an EFA to any supported instance that is in the `stopped` state. You cannot attach an EFA to an instance that is in the `running` state. For more information about the supported instance types, see Supported instance types.

You attach an EFA to an instance in the same way that you attach a network interface to an instance. For more information, see Attach a network interface.

Attach an EFA when launching an instance

AWS CLI

To attach an existing EFA when launching an instance

Use the run-instances command with the `--network-interfaces` option. For the primary network interface, specify an EFA network interface and `NetworkCardIndex=0`, `DeviceIndex=0`. To attach multiple EFA network interfaces, see Maximize network bandwidth.

```
--network-interfaces "NetworkCardIndex=0, \
    DeviceIndex=0, \
    NetworkInterfaceId=eni-1234567890abcdef0, \
    Groups=sg-1234567890abcdef0, \
    SubnetId=subnet-0abcdef1234567890"
```

To attach a new EFA when launching an instance

Use the run-instances command with the `--network-interfaces` option. For the primary network interface, use `NetworkCardIndex=0`, `DeviceIndex=0`, and `InterfaceType=efa`. If you are attaching multiple EFA network interfaces, see Maximize network bandwidth.

```
--network-interfaces "NetworkCardIndex=0, \
    DeviceIndex=0, \
    InterfaceType=efa, \
    Groups=sg-1234567890abcdef0, \
    SubnetId=subnet-0abcdef1234567890"
```

PowerShell

To attach an existing EFA when launching an instance

Use the New-EC2Instance cmdlet with the `-NetworkInterfaces` parameter.

```
-NetworkInterface $networkInterface
```

Define the network interface as follows.

```
$networkInterface = New-Object
 Amazon.EC2.Model.InstanceNetworkInterfaceSpecification
$networkInterface.DeviceIndex = 0
$networkInterface.NetworkInterfaceId = "eni-1234567890abcdef0"
$networkInterface.Groups = @("sg-1234567890abcdef0")
$networkInterface.SubnetId = "subnet-0abcdef1234567890"
```

To attach a new EFA when launching an instance

Use the New-EC2Instance cmdlet with the `-NetworkInterfaces` parameter.

```
-NetworkInterface $networkInterface
```

Define the network interface as follows.

```
$networkInterface = New-Object
 Amazon.EC2.Model.InstanceNetworkInterfaceSpecification
$networkInterface.DeviceIndex = 0
$networkInterface.InterfaceType = "efa"
$networkInterface.Groups = @("sg-1234567890abcdef0")
```

```
$networkInterface.SubnetId = "subnet-0abcdef1234567890"
```

Add an EFA to a launch template

You can create a launch template that contains the configuration information needed to launch EFA-enabled instances. You can specify both EFA and EFA-only network interfaces in the launch template. To create an EFA-enabled launch template, create a new launch template and specify a supported instance type, your EFA-enabled AMI, and an EFA-enabled security group. For `NetworkInterfaces`, specify the EFA network interfaces to attach. For the primary network interface, use `NetworkCardIndex=0`, `DeviceIndex=0`, and `InterfaceType=efa`. If you are attaching multiple EFA network interfaces, see Maximize network bandwidth on Amazon EC2 instances with multiple network cards.

You can leverage launch templates to launch EFA-enabled instances with other AWS services, such as AWS Batch or AWS ParallelCluster.

For more information about creating launch templates, see Create an Amazon EC2 launch template.

Detach and delete an EFA from an Amazon EC2 instance

You can detach an EFA from an Amazon EC2 instance and delete it in the same way as any other elastic network interface in Amazon EC2.

Detach an EFA

To detach an EFA from an instance, you must first stop the instance. You cannot detach an EFA from an instance that is in the running state.

You detach an EFA from an instance in the same way that you detach an elastic network interface from an instance. For more information, see Detach a network interface.

Delete an EFA

To delete an EFA, you must first detach it from the instance. You cannot delete an EFA while it is attached to an instance.

You delete EFAs in the same way that you delete elastic network interfaces. For more information, see Delete a network interface.

Monitor an Elastic Fabric Adapter on Amazon EC2

You can use the following features to monitor the performance of your Elastic Fabric Adapters.

Topics

- EFA driver metrics for an Amazon EC2 instance
- Amazon VPC flow logs
- Amazon CloudWatch

EFA driver metrics for an Amazon EC2 instance

The Elastic Fabric Adapter (EFA) driver publishes multiple metrics from the instances that have EFA interfaces attached, in real time. You can use these metrics to troubleshoot application performance and networking issues, choose the right cluster size for a workload, plan scaling activities proactively, and benchmark applications to determine whether they maximize the EFA performance available on an instance.

Topics

- Available EFA driver metrics
- Retrieve EFA driver metrics for your instance

Available EFA driver metrics

The EFA driver publishes the following metrics to the instance in real time. They provide the cumulative number of errors, connection events, and packets or bytes sent, received, retransmitted, or dropped by the attached EFA devices since instance launch or the last driver reset.

Metric	Description	Supported instance types
`tx_bytes`	The number of bytes transmitted. Unit: bytes	All instance types that support EFA
`rx_bytes`	The number of bytes received. Unit: bytes	All instance types that support EFA

Metric	Description	Supported instance types
tx_pkts	The number of packets transmitted. Unit: count	All instance types that support EFA
rx_pkts	The number of packets received. Unit: count	All instance types that support EFA
rx_drops	The number of packets that were received and then dropped. Unit: count	All instance types that support EFA
send_bytes	The number of bytes sent using send operations. Unit: bytes	All instance types that support EFA
recv_bytes	The number of bytes received by send operations. Unit: bytes	All instance types that support EFA
send_wrs	The number of packets sent using send operations. Unit: count	All instance types that support EFA
recv_wrs	The number of packets received by send operations. Unit: count	All instance types that support EFA

Metric	Description	Supported instance types
`rdma_write_wrs`	The number of completed rdma write operations. Unit: count	All instance types that support EFA
`rdma_read_wrs`	The number of completed rdma read operations. Unit: count	All instance types that support EFA
`rdma_write_bytes`	The number of bytes written to it by other instances using rdma write operations. Unit: bytes	All instance types that support EFA
`rdma_read_bytes`	The number of bytes received using rdma read operations. Unit: bytes	All instance types that support EFA
`rdma_write_wr_err`	The number of rdma write operations that had local or remote errors. Unit: count	All instance types that support EFA
`rdma_read_wr_err`	The number of rdma read operations that had local or remote errors. Unit: count	All instance types that support EFA

Metric	Description	Supported instance types
`rdma_read_resp_bytes`	The number of bytes sent in response to rdma read operations. Unit: bytes	All instance types that support EFA
`rdma_write_recv_bytes`	The number of bytes received by rdma write operations. Unit: bytes	All instance types that support EFA
`retrans_bytes`	The number of EFA SRD bytes retransmitted. Unit: count	Nitro v4 and later instance types that support EFA
`retrans_pkts`	The number of EFA SRD packets retransmitted. Unit: bytes	Nitro v4 and later instance types that support EFA
`retrans_timeout_events`	The number of times EFA SRD traffic timed out and resulted in a network path change. Unit: count	Nitro v4 and later instance types that support EFA
`impaired_remote_conn_events`	The number of times EFA SRD connections entered an impaired state, resulting in a reduced throughput rate limit. Unit: count	Nitro v4 and later instance types that support EFA

Metric	Description	Supported instance types
`unresponsive_remote_events`	The number of times an EFA SRD remote connection was unresponsive. Unit: count	Nitro v4 and later instance types that support EFA

For more information about the instance types that support EFA, see Supported instance types.

Retrieve EFA driver metrics for your instance

You can use the rdma-tool command line tool to retrieve the metrics for all EFA interfaces attached to an instance as follows:

```
$ rdma -p statistic show
link rdmap0s31/1
    tx_bytes 0
    tx_pkts 0
    rx_bytes 0
    rx_pkts 0
    rx_drops 0
    send_bytes 0
    send_wrs 0
    recv_bytes 0
    recv_wrs 0
    rdma_read_wrs 0
    rdma_read_bytes 0
    rdma_read_wr_err 0
    rdma_read_resp_bytes 0
    rdma_write_wrs 0
    rdma_write_bytes 0
    rdma_write_wr_err 0
    retrans_bytes 0
    retrans_pkts 0
    retrans_timeout_events 0
    unresponsive_remote_events 0
    impaired_remote_conn_events 0
```

Alternatively, you can retrieve the metrics for each EFA interface attached to an instance from the sys files using the following command.

```
$ more /sys/class/infiniband/device_number/ports/port_number/hw_counters/* | cat
```

For example

```
$ more /sys/class/infiniband/rdmap0s31/ports/1/hw_counters/* | cat
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/lifespan
::::::::::::::
12
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_read_bytes
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_read_resp_bytes
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_read_wr_err
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_read_wrs
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_write_bytes
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_write_recv_bytes
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_write_wr_err
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rdma_write_wrs
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/recv_bytes
```

```
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/recv_wrs
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rx_bytes
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rx_drops
::::::::::::::
0
::::::::::::::
/sys/class/infiniband/rdmap0s31/ports/1/hw_counters/rx_pkts
::::::::::::::

```

Amazon VPC flow logs

You can create an Amazon VPC Flow Log to capture information about the traffic going to and from an EFA. Flow log data can be published to Amazon CloudWatch Logs and Amazon S3. After you create a flow log, you can retrieve and view its data in the chosen destination. For more information, see VPC Flow Logs in the *Amazon VPC User Guide*.

You create a flow log for an EFA in the same way that you create a flow log for an elastic network interface. For more information, see Create a flow log in the *Amazon VPC User Guide*.

In the flow log entries, EFA traffic is identified by the `srcAddress` and `destAddress`, which are both formatted as MAC addresses, as shown in the following example.

```
version accountId  eniId        srcAddress        destAddress       sourcePort destPort
 protocol packets bytes start      end        action log-status
2       3794735123 eni-10000001 01:23:45:67:89:ab 05:23:45:67:89:ab -          -
 -        9       5689  1521232534 1524512343 ACCEPT OK
```

Amazon CloudWatch

To collect EFA driver metrics from an instance and publish them to CloudWatch, you can use the CloudWatch agent. For more information, see Collect EFA metrics with the CloudWatch agent in the *Amazon CloudWatch User Guide*.

If you are using EFA in an Amazon EKS cluster, you can monitor your EFAs using CloudWatch Container Insights. Amazon CloudWatch Container Insights supports all of the EFA driver metrics, except: `retrans_bytes`, `retrans_pkts`, `retrans_timeout_events`, `unresponsive_remote_events`, and `impaired_remote_conn_events`. For more information, see Amazon EKS and Kubernetes Container Insights metrics in the *Amazon CloudWatch User Guide*.

Verify the EFA installer using a checksum

You can optionally verify the EFA tarball (`.tar.gz` file) using an MD5 or SHA256 checksum. We recommend that you do this to verify the identity of the software publisher and to check that the application has not been altered or corrupted since it was published.

To verify the tarball

Use the **md5sum** utility for the MD5 checksum, or the **sha256sum** utility for the SHA256 checksum, and specify the tarball filename. You must run the command from the directory in which you saved the tarball file.

- MD5

```
$  md5sum tarball_filename.tar.gz
```

- SHA256

```
$  sha256sum tarball_filename.tar.gz
```

The commands should return a checksum value in the following format.

```
checksum_value tarball_filename.tar.gz
```

Compare the checksum value returned by the command with the checksum value provided in the table below. If the checksums match, then it is safe to run the installation script. If the checksums do not match, do not run the installation script, and contact Support.

For example, the following command verifies the EFA 1.9.4 tarball using the SHA256 checksum.

```
$  sha256sum aws-efa-installer-1.9.4.tar.gz
```

Example output:

```
1009b5182693490d908ef0ed2c1dd4f813cc310a5d2062ce9619c4c12b5a7f14 aws-efa-
installer-1.9.4.tar.gz
```

The following table lists the checksums for recent versions of EFA.

Version	Checksums

Elastic Fabric Adapter release notes

The following table describes the version history and changelog for the Elastic Fabric Adapter software.

Version	Changes	Release date
1.50.0	• Discontinue support for Amazon Linux 2. The last EFA installer version supporting AL2 is 1.49.0. • **Upgrade to libfabric 2.6.0amzn1.0** • **Upgrade to EFA driver 3.3.0** • **Upgrade to rdma-core 64.0** • **Upgrade to AWS OFI NCCL Plugin 1.21.1**	August 21, 2026
1.49.0	• **Upgrade to libfabric 2.4.0amzn5.0** • **Upgrade to EFA driver 3.1.0**	June 27, 2026

Version	Changes	Release date
	• **Upgrade to rdma-core 63.0** • **Upgrade to AWS OFI NCCL Plugin 1.20.0** • Discontinue support for openSUSE Leap. • **NGC install updates and bug fixes:** • Install missing libfabric-aws-bin/dev packages when `--build-ngc` is used. • Remove auto-detect of build-ngc use case, and remove the associated `--disable-build-ngc` option. • `--skip-rdma-core` is no longer implied when `--build-ngc` is specified. • Bug fix: when using `--build-ngc` and `--skip-rdma-core` is not specified, rdma-core is now installed as expected. • Full install is avoided in all NGC install use cases. • `--skip-mpi` and `--skip-rdma-core` are now global choices, not restricted to the NGC use case.	

Version	Changes	Release date
1.48.0	• **Upgrade to libfabric 2.4.0amzn3.0** • Optimize shm address retrieval in RDM operations • Fix use-after-free bugs in DC packet completion, CQ drain, AH unit test, and MR logging • Fix race conditions in efa_rdm_ep_get_peer and QP locking • Fix uninitialized descriptor arrays causing segfault with FI_EFA_ENABLE_SHM_TRANSFER=0 • Fix memory leaks in fi_info, err_buf, EFA device destructi on, and unit tests • Add null check for base_ep in CQ polling to handle destroyed QPs • Set qp->base_ep in efa_qp_create and return error if efa_mr_reg_ibv_mr returns NULL • Move QP table from domain to device with device-level locking • Add QP generation to data path direct request ID and verify QP number on CQE • Stop setting qp->ibv_qp_ex->wr_id for data path direct • Correctly remove txe from longcts_send list on receipt recv completion • Refactor and clean up efa_cq_handle_error •	April 14, 2026

Version	Changes	Release date
	Convert MR registration counters to atomic operations • Migrate shm MR registration code and introduce internal mr regv function • Disable MR cache by default under ASAN • Only disable zcpy_rx when p2p is not available but FI_HMEM is requested • Do not track tx pkt pool for non-debug build • Improve wait_send procedure and mock functions • Adjust log levels for efa-direct CQ err_data and efa_show_help • Define sanitizer macros and disable memhooks under ASAN • Add unit tests for ep enable error path and error completion handling • **Upgrade to libnccl-ofi 1.19.0** • Fixed error in handling dma-buf handles created by ROCm/HSA and added dma-buf support detection when using HSA runtime on ROCm platforms • Fixed potential memory leaks • Fixed NCCL topology generation for GB200 in Docker containers where NUMA nodes disconnected from Package nodes caused incorrect topology generation • Reduced QP utilization on NIC 0 during initialization	

Version	Changes	Release date
	• Improved tuner algorithm choices for P6-B200 and P6-B300 instance types • **Support for libnccl-ofi install on NGC containers** • **Add individual RPM/DEB package signature verification support** • **Add support for RHEL 10** • **Add OFI NCCL Plugin on Debian 12 and RHEL 10**	

Version	Changes	Release date
1.47.0	• **Upgrade to libfabric 2.4.0amzn1.0** • Refactor peer management: move endpoint→peer hashmap to AV level • Add packet entry generation counter to prevent ABA problem • Implement blocking CQ read support (fi_cq_sread) with wait objects • Fix double-free in eager/mulreq/longread RTM packet processing • Fix MR registration IBV access flags based on device RDMA capabilities • Disable FI_OPT_EFA_SENDRECV_IN_ORDER_ALIGNED _128_BYTES (returns -FI_EOPNOTSUPP) • Optimize packet entry to fit in two x86 cache lines (128 bytes) • Always succeed efa_rdm_srx_start and slide recv window on RTM/RTA errors • Unlink RX packet entries before releasing during endpoint cleanup • **Upgrade to libnccl-ofi 1.18.0** • P6-B300 support: added custom tuner decisions for P6-B300 • Improved performance of PAT on P6-B200 by reducing channel count for smaller message sizes	January 29, 2026

Version	Changes	Release date
	• Changed protocol defaults, default to RDMA protocol on Trn1 and default to SENDRECV protocol on g7e.8xlarge • Dynamic platform selection: added feature to enable AWS optimizations at runtime based on presence of AWS NICs. This allows a single plugin binary to be used for both AWS and non-AWS platforms. AWS optimizations can still be disabled at compile-time. • Fixed support for non-FI_MR_VIRT_ADDR providers in RDMA protocol • Improved NIC PCIe link speed and width reporting to NCCL • Redesigned threading model to support multi-threaded applications without requiring a separate Libfabric domain for each thread. • Fixed support for FI_MR_ENDPOINT providers (supports SENDRECV protocol only) by cleaning up resources in correct order • **Upgrade to rdma-core 61.0** • Use single threaded CQ if Thread Domain was provided • Verify QP number on CQE processes • **Upgrade to efa driver 3.0.0** • Improve admin error handling • Check for QP number correctness on completion poll • Remove unconditional backport of best page size finding • Print errno strings for error pointers	

Version	Changes	Release date
	• Simplify the code in CQ creation flows • Backport upstream changes in CQ with umem creation flow • Adjust DKMS configuration for new DKMS versions • **Upgrade to Open MPI 5.0.9amzn1** • Bugfix: Set domain threading level based on MPI thread support • Bugfix: Request FI_COMPLETION flag to ensure completio ns are generated for all data transfer events • Share domains between BTL and MTL to reduce the total number of domains created to fix resource exhaustion on systems with high core counts	
1.46.0	• **Add Support for Debian 13** • **Upgrade to efa-nv-peermem 1.2.3** • Fix build errors and warnings with new kernels and DKMS • **Upgrade to libfabric 2.3.1amzn4.0** • Enable data path direct for efa-rdm protocol path • Enable ROCr HMEM support • New FI_OPT_EFA_USE_UNSOLICITED_WRITE_RECV option to disable unsolicited write recv • Optimize connection establishment time • **Add libnccl-ofi on RHEL 9, Rocky Linux 9, and Debian 13**	December 12, 2025

Version	Changes	Release date
1.45.1	• **Upgrade to libfabric 2.3.1amzn3.0** • Fix bug that truncated cq_data to 2 bytes while provider advertised support for 4 bytes	November 26, 2025

Version	Changes	Release date
1.45.0	• **Upgrade to rdma-core 60.amzn0** • Extend DV query CQ to return doorbell • **Upgrade to libfabric 2.3.1amzn2.0** • Support FI_RX_CQ_DATA mode for efa-direct • Optimize WQE post in data path direct path • Fix the race condition in cntr progress • Improve the logging for warning messages • Handles RMA completion correctly for removed peers • Evict AH entries from implicit AV when AH limit is reached • **Upgrade to libnccl-ofi 1.17.2** • Fixed a crash with NCCL v2.28.x when Libfabric initializ ation failed • Added support for g7e instance family • Fixed an issue where NCCL could erroneously attempt to use a GPUDirect RDMA path on platforms that support DMA-BUF • Fixed shutdown ordering issue on NICs that require per-endpoint memory registration (Cray Slingshot)	November 17, 2025

Version	Changes	Release date
1.44.0	• **Upgrade to rdma-core 59.amzn0** • Add support to bind QPs and CQs to thread domains • Add support to allocate a parent domain • Add support to allocate thread domains • Add direct verbs query QP and CQ • Add option to create CQ with external memory` • Fix CQ poll after QP destroy • **Upgrade to libfabric 2.3.1amzn1.0** • **Upgrade to Open MPI 5.0.8amzn1** • Functionality enhancements • Bug fixes • **Upgrade to libnccl-ofi 1.17.1** • Supports NCCL v2.28.3-1 while maintaining backward compatibility with NCCL v2.17.1 and later. • Building with platform-aws requires Libfabric v1.22.0amzn4.0 or greater. Tested with versions up to Libfabric v2.3.1amzn1.0. • Fixes to support compatibility across CUDA12 and CUDA13.	October 29, 2025

Version	Changes	Release date
1.43.3	• **Upgrade to efa driver 2.17.3** • Support P2P with NVIDIA 580 drivers • Adjust MR registration for 6.17 and on kernels	October 01, 2025
1.43.2	• **Upgrade to libnccl-ofi 1.16.3** • Supports NCCL v2.27.7-1 while maintaining backward compatibility with NCCL v2.17.1 and later. • Building with platform-aws requires Libfabric v1.22.0amzn4.0 or greater. Tested with versions up to Libfabric 2.1.0amzn5.0. • Enable domain-per-thread by default on all Amazon EC2 instance types for improved performance for some applications where NCCL creates multiple proxy threads	August 15, 2025
1.43.1	• **Upgrade to libnccl-ofi 1.16.2** • Supports NCCL v2.27.6-1 while maintaining backward compatibility with NCCL v2.17.1 and later. • Building with platform-aws requires Libfabric v1.22.0amzn4.0 or greater. Tested with versions up to Libfabric 2.1.0amzn4.0. • Added a new platform configuration to support using the OFI NCCL plugin on the Amazon EC2 p5.4xlarge instance type • **Upgrade to libfabric 2.1.0amzn5.0**	July 31, 2025

Version	Changes	Release date
1.43.0	• **Upgrade to libnccl-ofi 1.16.1** • Supports NCCL v2.27.6-1 while maintaining backward compatibility with NCCL v2.17.1 and later. • Building with platform-aws requires Libfabric v1.22.0amzn4.0 or greater. Tested with versions up to Libfabric 2.1.0amzn3. • Update the PCI link speed format reported in the topology file to match kernel 5.7+ • Added SKIP_NICS_WITHOUT_ACCEL_AT_SAME_PCI_LEVEL to skip libfabric nics that do not have an accelerator at the same pci level • **Upgrade to efa driver 2.17.2** • **Upgrade to efa-nv-peermem 1.2.2** • **Upgrade to libfabric 2.1.0amzn4.0** • **Upgrade to rdma-core 58.amzn0** • Fix work request index double use • Add WQE length to post_send tracepoint • **Enable optimizations for Graviton platforms** • **Deprecate support for Ubuntu 20.04**	July 25, 2025

Version	Changes	Release date
1.42.0	• **Upgrade to efa driver 2.15.3** • **Upgrade to efa-nv-peermem 1.2.1** • **Upgrade to rdma-core 57.amzn1** • Fix work request index double use • **Upgrade to libfabric 2.1.0amzn3.0** • **Upgrade to libnccl-ofi 1.15.0** • Supports NCCL 2.26.6-1 while maintaining backward compatibility with (NCCL v2.17.1 and later. • Building with platform-aws requires Libfabric v1.22.0amzn4.0 or greater. Tested with versions up to Libfabric 2.1.0amzn3. • Build system and platform support • Added Amazon EC2 P6-B200 platform support • Changed default plugin library name to libnccl-net-ofi.so, and by default create symlink from libnccl-net-ofi.so to libnccl-net.so to maintain backward compatibility. This allows users to set NCCL_NET_PLUGIN=ofi to force NCCL to use the OFI plugin for communication. Specifying --disable-nccl-net-symlink to configure will skip the symlink, allowing multiple plugins to be installed in the same container. • Tuning and performance improvements • Added tuner support on P6-B200 for AllReduce, AllGather, and ReduceScatter regions for 0x0 and 0x7 bitmask • Updated default latency for P5en and P6-B200 platforms based on empirical results and analysis	June 6, 2025

Version	Changes	Release date
	• Update to use NCCL v10 API with trafficClass parameter support for future traffic prioritization • Migrated plugin code base from C to C++ • Added support for jobs where the number of NICs per GPU is different across systems. See the OFI_NCCL_FORCE_NUM_RAILS runtime environment variable documentation for more information.	
1.41.0	• Upgrade to rdma-core 57.amzn0	May 16, 2025
1.40.0	• Upgrade to libfabric 2.1.0amzn2.0 • Upgrade to rdma-core 56.0 • Upgrade to efa-config 1.18. • Deprecate support for Debian 10 • Upgrade to libnccl-ofi 1.14.2 • Enable CUDA support in Libfabric on ARM for Ubuntu and Amazon Linux 2023 • Add libnccl-ofi on ARM for Ubuntu and Amazon Linux 2023	May 2, 2025
1.39.0	• Upgrade to libfabric 2.1.0 • Upgrade to Open MPI 5.0.6 • Upgrade to libnccl-ofi 1.14.1 • Upgrade to efa driver 2.15.0	April 16, 2025
1.38.1	• Update to `Libfabric 1.22.0amzn5.0`	March 3, 2025
1.38.0	• Add `libnccl-ofi 1.13.2-1`	January 8, 2025
1.37.0	• Upgrade to `libfabric 1.22.0amzn4.0` • Upgrade to `rdma-core 54.amzn0`	November 18, 2024

Version	Changes	Release date
1.36.0	• Add support for Debian 12 • Distribute `efa_test.sh` as a utility script at `/opt/amazon/efa/bin` • Upgrade to efa driver 2.13.0 • Upgrade to `libfabric 1.22.0amzn3.0` • Upgrade to `rdma-core 54.0` • Upgrade to open mpi 4.1.7	November 7, 2024
1.35.0	• Upgrade to Open MPI 5.0.5 • Upgrade to PRRTE 3.0.6 and rename the RPM package to prrte-aws • Rename the OpenPMIx RPM package to pmix-aws • Configure build options for dpkg and RPM builds • Upgrade to `Libfabric 1.22.0amzn2.0` • Upgrade to efa driver 2.12.1	October 14, 2024
1.34.0	• Drop support for CentOS 7 and RHEL 7 • Ingest `Libfabric 1.22.0amzn1.0` • Update efa-config package to 1.17	August 6, 2024
1.33.0	• Upgrade to efa driver 2.10.0 • Upgrade to `rdma-core 52.0` • Upgrade to PRRTE 3.0.5 • Upgrade to Open MPI 5.0.3 • Add support for Ubuntu 24.04 LTS • Remove OpenPMIx, PRRTE and Open MPI HTML documentation. Users should refer to the official website. • Drop support for openSUSE 15.4 or older	June 20, 2024

Version	Changes	Release date
1.32.0	• Upgrade to efa driver 2.8.0 • Upgrade to efa-nv-peermem driver 1.1.1 • Upgrade efa-config package to 1.16 • Upgrade efa-profile package to 1.7 • Upgrade to `rdma-core 50.0` • Upgrade to `libfabric 1.21.0amzn1.0` • Enhance `efa_test.sh` with `fi_pingpong` port selection • Install newer rdma-core from system when required	April 18, 2024
1.31.0	• Upgrade to OpenPMIx 4.2.8 • Upgrade to PRRTE 3.0.3 • Upgrade to Open MPI 5.0.2, and convert MCA components to DSO. • Upgrade to `Libfabric 1.20.1amzn1.0`	March 7, 2024
1.30.0	• Include OpenPMIx 4.2.7, installed at `/opt/amazon/pmix` by default • Include PRRTE 3.0.2, installed at `/opt/amazon/prrte` by default • Include Open MPI 5.0.0, installed at `/opt/amazon/openmpi5` by default • Update efa-profile to 1.6	December 2023
1.29.1	• Ingest `libfabric 1.19.0amzn4.0`	December 2023
1.29.0	• Ingest efa kernel driver 2.6.0 • Ingest `libfabric 1.19.0amzn3.0`	November 2023
1.28.0	• Upgrade Open MPI to 4.1.6 • Ingest `libfabric 1.19.0amzn2.0`	October 2023

Version	Changes	Release date
1.27.0	• Add `Libfabric 1.19.0amzn1.0` to installer • Enable GCC builtin atomics for Open MPI 4	September 2023
1.26.1	• `efa_test.sh` : fix infinite retry bug	September 2023
1.26.0	• Add support for RHEL 9 • Fix debug build on multiple distributions • Ingest `libfabric 1.18.2amzn1.0` • `efa_test.sh` : Add retry for `fi_pingpong`	September 2023
1.25.1	• Ingest `libfabric 1.18.1amzn1.0` • Update timeouts in EFA installer scripts	September 2023
1.25.0	• Add support for Amazon Linux 2023 • Bugfix in post-installation test	July 2023
1.24.1	• Upgrade libfabric to 1.18.1 • Upgrade efa driver to 2.5.0	July 2023
1.24.0	• Ingest `rdma-core 46.0` • Ingest efa driver 2.4.1 • Support Debian 11	June 2023
1.23.1	• Ingest `libfabric 1.18.0amzn2.0`	June 2023
1.23.0	• Add support for Debian 10 • Drop support for Ubuntu 18.04 LTS • Upgrade efa-config package to 1.14 • Ingest `libfabric 1.18.0amzn1.0`	May 2023
1.22.1	• Upgrade libfabric to 1.17.1	March 2023

Version	Changes	Release date
1.22.0	• Upgrade Open MPI to 4.1.5 • Upgrade libfabric to 1.17.0 • Upgrade efa-config package to 1.13	February 2023
1.21.0	• Add support for Rocky Linux 9 OS • Ingest efa driver 2.1.1 • Ingest `libfabric 1.16.1amzn3.0` • Upgrade efa-config package to 1.12	December 2022
1.20.0	• Add support for Rocky Linux 8 OS. • Ingest efa driver 2.1.0. • Ingest `rdma-core 43.0`. • Ingest `libfabric 1.16.1amzn1.0`	November 2022
1.19.0	• Ingest `libfabric 1.16.0` • Build Open MPI with `--enable-orterun-prefix-by-default`	October 2022
1.18.0	• Add support for Ubuntu22.04	August 2022
1.17.3	• Update libfabric to `1.16.0~amzn4.0` . The ~ indicates it is a pre-release version of libfabric 1.16.0. • Extend post-installation pingpong test timeout to 20 seconds	August 2022
1.17.2	• Update libfabric to `1.16.0~amzn3.0` . The ~ indicates it is a pre-release version of libfabric 1.16.0.	July 2022
1.17.1	• Update libfabric to `1.16.0~amzn2.0` . The ~ indicates it is a pre-release version of libfabric 1.16.0. • Disable the experimental net provider when building libfabric	July 2022

Version	Changes	Release date
1.17.0	• Update `rdma-core` to v41.0 • Update Open MPI to 4.1.4 • Update libfabric to `1.16.0~amzn1.0` . The ~ indicates it is a pre-release version of libfabric 1.16.0.	July 2022
1.16.0	• Update libfabric to `1.15.1amzn1.0` , contains neuron library name change • Upgrade efa-config to 1.10 • Exclude opx and rxd providers in the libfabric build	June 2022
1.15.2	• Update libfabric to 1.14.1	May 2022
1.15.1	• Update libfabric to `1.14.0amzn1.0`	March 2022
1.15.0	• Fix a bug that cause installation fail on Open SuSE 15.3 • Drop support of Open SuSE 15.2 (as Open SuSE 15.2 reached end of life) • Drop Support of CentOS 8 (as CentOS 8 reached end of life) • Update libfabric to 1.14.0 • Update efa kernel driver to 1.16.0 • Update `rdma-core` to v39.0 • Update Open MPI to version 4.1.2.	Feburary 2022
1.14.1	• Update libfabric to `1.13.2amzn1.0` .	October 2021

Version	Changes	Release date
1.14.0	• Ingest efa kernel driver 1.14.2. • Make `-g, --enable-gdr` in `efa_installer.sh` as a no-op option as the latest efa kernel driver enables GDR support by default. • Ingest `rdma-core v37.0`. • Ingest `libfabric 1.13.2`. • Add packages list and compare RPM/DEB to list during installation to prevent unknown package installations. • Add sleep in installer script to wait for udev rule to apply after EFA driver reload.	October 2021
1.13.0	• Update `rdma-core` to v35.0. • Update `libfabric` to v1.13.0amzn1.0. • Add EFA support for CentOS/RHEL 8 on Gravition2 platform. • Add version comparison logic in installer script to skip the local package installation when there is one installed in system with higher version.	August 2021
1.12.3	• Update EFA kernel module to 1.13.0. • Update efa-config package to version 1.9. Improve the calculation of huge page reservation to handle large defaulted huge page size.	July 2021
1.12.2	• Update EFA kernel module to 1.12.3. • Build Open MPI debian packages with `--with-libevent=external` and `--with-hwloc=external` . • Bump Open MPI rpm build ID to 2 to fix backward compatibility issue of HWLOC on CentOS 8. • Remove the installation of kernel-devel and kernel-source packages on SLES15SP2 and openSUSE 15.2.	June 2021
1.12.1	• Update Libfabric to version 1.11.2amzon1.1. • Update EFA kernel module to version 1.12.1.	May 2021

Version	Changes	Release date
1.12.0	• Update Open MPI to version 4.1.1. • Update Libfabric to version 1.11.2amzn1.0. • Build rdma-core for Amazon Linux 2 using the same packaging configuration as the AL2 rdma-core. • Do not force `-Wl,--enable-new-dtags` when building Open MPI RPMs. • Build Open MPI with system libraries for hwloc and libevent. • Update EFA kernel module to version 1.12.0 • Update efa-config package to version 1.8. Improve the calculation of huge page reservation for long-lived instances. • Update efa-profile package to version 1.5. Remove the open mpi collective tuning file that worked as a workaround to fix Open MPI 4.1.0 hang on P4d. • Update `rdma-core` to v32.1. • Drop support for Amazon Linux 1 and Ubuntu 16.04.	May 2021
1.11.2	• Fix Open MPI hang when using Open MPI on P4d by changing the default algorithm used to implement MPI_BARRIER via a configuration file. • Disable use of builtin atomics in Open MPI on ARM via `--disable-builtin-atomics` to work around compiler issue.	February 2021
1.11.1	• Update Open MPI to version 4.1.0. • Update efa-config package to version 1.7. Improve calculati on of huge page reservation count. • Update efa-profile package to version 1.3. Removes unneeded collectives decision file now that Open MPI 4.1.0 is used.	December 2020

Version	Changes	Release date
1.11.0	• Add support for Gravition2 platform. • Update `rdma-core` to version 31.2amzn. • Update Libfabric to version 1.11.1amzn1.0. • Update efa-config to version 1.6. • Update efa-profile to version 1.2.	December 2020
1.10.1	• Add support for CentOS / RHEL 8. • Add support for Ubuntu 20.04. • Add support for SUSE Linux Enterprise 15.	November 2020
1.10.0	• Add GPUDirect RDMA support for P4d platform. Use `--enable-gdr` installer option to instal GDR-aware kernel module and userspace. • Update EFA kernel module to version 1.10.2. • Update `rdma-core` to version 31.amzn0. • Update Libfabric to version 1.11.1. • Update Open MPI to version 4.0.5. • Update efa-config to version 1.5. • Update efa-profile to version 1.1. Includes improved Open MPI collectives decision file.	October 2020
1.9.5	• Update efa-config to version 1.4. Fixes bug in Open MPI collective decision file.	September 2020
1.9.4	• Update Open MPI to version 4.0.3. • Update Libfabric to version 1.10.1amazon1.1. • Update `rdma-core` to version 28.amzn0.	July 2020

Version	Changes	Release date
1.9.3	• Update EFA kernel module to version 1.6.0. • Update `rdma-core` to version 28.amzn0. • Update Libfabric to version 1.10.1amzn1.1. • Update efa-config to version 1.3. Adds collectives tuning file for Open MPI. • Skip dkms installation if it is already installed. • Fix `--skip-kmod` installation mode to actually work.	June 2020
1.8.4	• Move configuration files into efa-config and efa-profile packages so that they are tracked by the operating system package manager. • Update Open MPI to version 4.0.3.	April 2020
1.8.3	• Update EFA kernel module to version 1.5.1. • Distributed DKMS on some platforms rather than relying on EPEL repositories for added installation reliability. • On RHEL 7, install RPMs built on CentOS 7 instead of RPMs built on Amazon Linux 2.	February 2020
1.8.2	• Revert `rdma-core` to version 25 due to a mismatch in device naming between kernel module and `rdma-core` .	January 2020
1.8.1	• Update Libfabric to version 1.9.0amzn1.1.	January 2020
1.8.0	• Update `rdma-core` to version 27.0. • Update EFA kernel module to version 1.5.0. • Update Libfabric to version 1.9.0amzn1.0. • Add option `--minimal` to install just the EFA kernel module and `rdma-core` .	December 2019
1.7.1	• Update Libfabric to version 1.8.1amzn1.3.	December 2019

Version	Changes	Release date
1.7.0	• Add Libfabric module file. • Update Libfabric to version 1.8.1amzn1.1.	November 2019
1.6.2	• Update Open MPI to version 1.6.2.	October 2019
1.6.1	• Update Libfabric to version 1.8.1amzn1.0. • Update Open MPI to version 4.0.1. • Update `rdma-core` to version 26.0.	October 2019
1.5.4	• Update EFA kernel module to version 1.4.1.	September 2019
1.5.3	• Update EFA kernel module to version 1.3.1. • Avoid installing `kernel-devel` or `linux-headers` packages unless installing the kernel driver.	September 2019
1.5.1	• Only configure huge pages when EFA device is present.	August 2019
1.5.0	• Update Libfabric to version 1.8.0amzn1.1. • Update `rmda-core` to version 25.0.	August 2019
1.4.1	• Add Libfabric and Open MPI library paths (`/opt/amazon/efa/lib64` and `/opt/amazon/efa/openmpi/lib`) to `/etc/ld.so.conf.d/efa.conf` to ensure the Open MPI and Libfabric shared libraries are properly located.	July 2019
1.4.0	• Update EFA kernel module to version 1.3.0. • Update Libfabric to version 1.8.0amzn1.0 • First release to support Intel MPI 2019 Update 4.	July 2019

Amazon EC2 topology

Amazon EC2 topology provides a hierarchical view of the relative proximity of your compute capacity. You can use this information to manage high performance computing (HPC), machine learning (ML), and generative AI compute infrastructure at scale.

Available APIs

Amazon EC2 provides two APIs for understanding your EC2 topology:

- DescribeInstanceTopology
  - Shows where your *running* instances are located relative to each other in the network hierarchy.
  - Helps optimize where to run your workloads on your existing instances.
- DescribeCapacityReservationTopology
  - Shows where your reserved capacity will be located relative to each other in the network hierarchy *before you launch instances*.
  - Helps with capacity planning by letting you know the placement of reserved capacity before launching instances.

Key benefits

EC2 topology provides the following key benefits:

- Capacity management – Optimize resource utilization.
- Job scheduling – Make informed decisions about workload placement.
- Node ranking – Understand relative proximity for performance optimization on tightly coupled instances.

Considerations

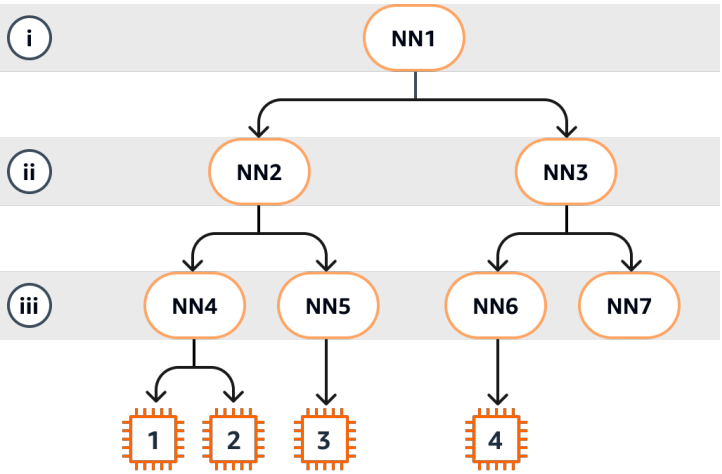
- Topology views are only available for:
  - Instances in the `running` state
  - Capacity Reservations in the `pending` or `active` state
- Each topology view is unique per AWS account.
- The AWS Management Console does not support viewing topology.

- While topology information helps you understand instance placement, you can't use it to launch a new instance physically close to an existing instance. To influence instance placement, you can create Capacity Reservations in cluster placement groups.

Pricing

There is no additional cost for describing your EC2 topology.

Contents



- How Amazon EC2 topology works
- Prerequisites for Amazon EC2 topology
- Examples for Amazon EC2 instance topology

How Amazon EC2 topology works

The AWS network is arranged in a hierarchy of layers. EC2 instances connect into the network at or below the third layer, depending on the instance type. An instance's topology is described by a set of nodes, with one node in each layer of the network. The node set in the DescribeInstanceTopology or DescribeCapacityReservationTopology API response provides a top-down view of the network hierarchy, with the bottom node connected to an instance.

> **Note**
>
> Some instance types comprise 4 network nodes in a node set representing 4 layers in the network, while others comprise 3 network nodes representing 3 layers in the network. For the supported instance types, see Instance types.
> Depending on the type of Capacity Reservation, you might see only 1, 2, or 3 network nodes.

The following diagram provides a visual representation that you can use to understand EC2 topology. The network nodes are identified as **NN1** – **NN7**. The numerals **i**, **ii**, and **iii** identify the network layers. The numbers **1**, **2**, **3**, and **4** identify the EC2 instances. Instances connect to a node in the bottom layer, identified by **iii** in the following diagram. More than one instance can connect to the same node.

In this example:

- Instance 1 connects to network node 4 (NN4) in layer iii. NN4 connects to network node 2 (NN2) in layer ii, and NN2 connects to network node 1 (NN1) in layer i, which is the top of the network hierarchy in this example. The network node set comprises NN1, NN2, and NN4, expressed hierarchically from the upper layers to the bottom layer.
- Instance 2 also connects to network node 4 (NN4). Instance 1 and instance 2 share the same network node set: NN1, NN2, and NN4.
- Instance 3 connects to network node 5 (NN5). NN5 connects to NN2, and NN2 connects to NN1. The network node set for instance 3 is NN1, NN2, and NN5.
- Instance 4 connects to network node 6 (NN6). Its network node set is NN1, NN3, and NN6.

When considering the proximity of instances 1, 2, and 3, instances 1 and 2 are closer to each other because they connect to the same network node (NN4), while instance 3 is further away because it connects to a different network node (NN5).

When considering the proximity of all the instances in this diagram, instances 1, 2, and 3 are closer to each other than they are to instance 4 because they share NN2 in their network node set.

As a general rule, if the network node connected to any two instances is the same, these instances are physically close to each other, as is the case with instances 1 and 2. Furthermore, the fewer the number of hops between network nodes, the closer the instances are to each other. For example, instances 1 and 3 have fewer hops to a common network node (NN2) than they have to the network node (NN1) they have in common with instance 4, and are therefore closer to each other than they are to instance 4.

There are no instances running under network node 7 (NN7) in this example, and therefore the API output won't include NN7.

How to interpret the DescribeInstanceTopology output

You can describe the instance topology using the DescribeInstanceTopology API. The output provides a hierarchical view of the underlying network topology for an instance.

The following example output corresponds to the network topology information of the four instances in the preceding diagram. Comments are included in the example output for the purposes of this example.

The following information in the output is important to note:

- `NetworkNodes` describes the network node set of a single instance.
- In each network node set, the network nodes are listed in hierarchical order from top to bottom.
- The network node that is connected to the instance is the last network node in the list (the bottom layer).
- To work out which instances are close to each other, first find common network nodes in the bottom layer. If there are no common network nodes in the bottom layer, then find common network nodes in the upper layers.

In the following example output, `i-1111111111example` and `i-2222222222example` are located closest to each other compared to the other instances in this example because they have the network node `nn-4444444444example` in common in the bottom layer.

> **Note**
>
> The response contains 3 or more network nodes. For information about the number of network nodes in the response for each supported instance type, see Instance types.

        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

How to interpret the DescribeCapacityReservationTopology output

You can describe the Capacity Reservation topology using the DescribeCapacityReservationTopology API. The output provides a hierarchical view of the underlying network topology for the reserved capacity.

The following example output corresponds to the network topology information in the preceding diagram. Comments are included in the example output for the purposes of this example.

The following information in the output is important to note:

- `NetworkNodes` describes the network node set of a single Capacity Reservation.
- In each network node set, the network nodes are listed in hierarchical order from top to bottom.
- The network node that is connected to the Capacity Reservation is the last network node in the list (the bottom layer).
- To work out whether Capacity Reservations will be close to each other, first find common network nodes in the bottom layer in the output. If there are no common network nodes in the bottom layer, then find common network nodes in the upper layers.

In the following example output, `cr-1111111111example` is located on `nn-2222222222example` and `cr-2222222222example` is located on `nn-3333333333example`. Because the Capacity Reservations are on different network nodes in `layer ii`, communication from instances in one Capacity Reservation to instances in the other Capacity Reservation will be inefficient.

> **Note**
>
> The response contains 1, 2, or 3 network nodes depending on the type of Capacity Reservation.

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1111111111example",
            "CapacityBlockId": "null",
            "State": "active",
            "InstanceType": "p4d.24xlarge",
            "NetworkNodes": [
                "nn-1111111111example",      //Corresponds to NN1 - layer i
                "nn-2222222222example"       //Corresponds to NN2 - layer ii
                // Visibility of additional nodes requires an instance launch and
                // the DescribeInstanceTopology API
            ],
            "AvailabilityZone": "us-west-2a"
        },
        {
            "CapacityReservationId": "cr-2222222222example",
            "CapacityBlockId": "null",
            "State": "active",
            "InstanceType": "trn1.2xlarge",
            "NetworkNodes": [
                "nn-1111111111example",      //Corresponds to NN1 - layer i
                "nn-3333333333example"       //Corresponds to NN3 - layer ii
                // Visibility of additional nodes requires an instance launch and
                // the DescribeInstanceTopology API
            ],
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

Differences between DescribeInstanceTopology and DescribeCapacityReservationTopology

The following table compares the key differences between the DescribeInstanceTopology and DescribeCapacityReservationTopology APIs:

Comparison point	DescribeInstanceTopology	DescribeCapacityReservationTopology
Usage phase	Post-launch (execution mode)	Pre-launch (planning and management mode)
Primary purpose	Optimize workloads on running instances	Capacity planning and Capacity Reservation management (merge, split, assign) before instance launch
Number of network nodes	Shows all nodes for a running instance. If the instance is in a Capacity Reservation, the first nodes will match the corresponding Capacity Reservation topology, followed by additional nodes to connect to the instance.	Shows a partial set of nodes, which vary based on the Capacity Reservation state (`pending` or `active`) and type.*
State	Instances must be in `running` state	Capacity Reservations must be in `pending` or `active` state
Use cases	• Workload optimization • Performance tuning • Runtime topology analysis	• Capacity planning • Capacity Reservation management (merge/split/assign) • Pre-launch topology assessment

* For Capacity Blocks for Ultraservers, the network node set is the same when describing the topology for an `active` Capacity Reservation or its running instance.

Prerequisites for Amazon EC2 topology

To describe your Amazon EC2 topology, ensure that your instances and Capacity Reservations meet the following prerequisites.

Prerequisites for:

- AWS Regions
- Instance types
- State
- IAM permissions

AWS Regions

Supported AWS Regions:

- US East (N. Virginia), US East (Ohio), US West (N. California), US West (Oregon)
- Africa (Cape Town)
- Asia Pacific (Jakarta), Asia Pacific (Hong Kong), Asia Pacific (Hyderabad), Asia Pacific (Melbourne), Asia Pacific (Mumbai), Asia Pacific (Osaka), Asia Pacific (Seoul), Asia Pacific (Singapore), Asia Pacific (Sydney), Asia Pacific (Tokyo)
- Canada (Central)
- Europe (Frankfurt), Europe (Ireland), Europe (London), Europe (Paris), Europe (Spain), Europe (Stockholm), Europe (Zurich)
- Israel (Tel Aviv)
- Middle East (Bahrain), Middle East (UAE)
- South America (São Paulo)
- AWS GovCloud (US-West)
- AWS European Sovereign Cloud (Germany)

The DescribeCapacityReservationTopology API is not supported in Israel (Tel Aviv) and AWS GovCloud (US-West).

Instance types

Supported instance types:

- Returns **3* network nodes** in the response:
  - `g6e.xlarge` | `g6e.2xlarge` | `g6e.4xlarge` | `g6e.8xlarge` | `g6e.12xlarge` | `g6e.16xlarge` | `g6e.24xlarge` | `g6e.48xlarge` | `g7e.2xlarge` | `g7e.4xlarge` | `g7e.8xlarge` | `g7e.12xlarge` | `g7e.24xlarge` | `g7e.48xlarge`
  - `hpc6a.48xlarge` | `hpc6id.32xlarge` | `hpc7g.4xlarge` | `hpc7g.8xlarge` | `hpc7g.16xlarge` | `hpc7a.12xlarge` | `hpc7a.24xlarge` | `hpc7a.48xlarge` | `hpc7a.96xlarge` | `hpc8a.96xlarge`
  - `p3dn.24xlarge` | `p4d.24xlarge` | `p4de.24xlarge` | `p5.48xlarge` | `p5e.48xlarge` | `p5en.48xlarge` | `p6e-gb200.36xlarge`
  - `trn1.2xlarge` | `trn1.32xlarge` | `trn1n.32xlarge` | `trn2.48xlarge` | `trn2u.48xlarge`
- Returns **4* network nodes** in the response:
  - `p6-b200.48xlarge` | `p6-b300.48xlarge`

* The number of network nodes returned is only applicable when using the DescribeInstanceTopology API. For the DescribeCapacityReservationTopology API, the number of network nodes returned will vary depending on the type and state of the Capacity Reservation.

The available instance types vary by Region. For more information, see Amazon EC2 instance types by Region.

State

- For `DescribeInstanceTopology` – Instances must be in the `running` state.
- For `DescribeCapacityReservationTopology` – Capacity Reservations must be in the `pending` or `active` state.

You can't get topology information for instances or Capacity Reservations in any other state.

IAM permissions

Your IAM identity (user, user group, or role) requires the following permissions:

- `ec2:DescribeInstanceTopology`
- `ec2:DescribeCapacityReservationTopology`

Examples for Amazon EC2 instance topology

You can use the describe-instance-topology command to describe the topology for your EC2 instances. And you can use the describe-capacity-reservation-topology command to describe the topology of your Capacity Reservations.

When you use the `describe-instance-topology` or `describe-capacity-reservation-topology` command without parameters or filters, the response includes all your instances or Capacity Reservations (depending on the command used) that match the supported instance types for this command in the specified Region. You can specify the Region by including the `--region` parameter, or by setting a default Region. For more information about setting a default Region, see Select a Region for your Amazon EC2 resources.

You can include parameters to return instances or Capacity Reservations that match specified instance or Capacity Reservation IDs or placement group names. You can also include filters to return instances or Capacity Reservations that match a specified instance type or instance family, or instances or Capacity Reservations in a specified Availability Zone or Local Zone. You can include a single parameter or filter, or a combination of parameters and filters.

The output is paginated, with up to 20 instances or Capacity Reservations per page by default. You can specify up to 100 instances or Capacity Reservations per page using the `--max-results` parameter.

For more information, see describe-instance-topology and describe-reservation-topology-topology.

Required permissions

The following permissions are required:

- `ec2:DescribeInstanceTopology` – For describing instance topology
- `ec2:DescribeCapacityReservationTopology` – For describing Capacity Reservation topology

Examples

- Example 1: DescribeInstanceTopology - Instance IDs
- Example 2: DescribeInstanceTopology - Placement group name parameter
- Example 3: DescribeInstanceTopology - Instance type filter

- Example 3a – Exact match filter for a specified instance type
- Example 3b – Wild card filter for an instance family
- Example 3c – Combined instance family and exact match filters
- Example 4: DescribeInstanceTopology - Zone ID filter
  - Example 4a – Availability Zone filter
  - Example 4b – Local Zone filter
  - Example 4c – Combined Availability Zone and Local Zone filters
- Example 5: DescribeInstanceTopology - Instance type and zone ID filters
- Example 6: DescribeCapacityReservationTopology - Capacity Reservation IDs
- Example 7: DescribeCapacityReservationTopology - Instance type filter

Example 1: DescribeInstanceTopology - Instance IDs

AWS CLI

To describe the topology of specific instances

Use the describe-instance-topology command with the `--instance-ids` parameter. The output includes only the instances that match the specified instance IDs.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
    --instance-ids i-1111111111example i-2222222222example
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
```

```
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "GroupName": "HPC-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of specific instances

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -InstanceId i-1111111111example, i-2222222222example
```

Example 2: DescribeInstanceTopology - Placement group name parameter

AWS CLI

To describe the topology of instances in a specific placement group

Use the describe-instance-topology command with the `group-names` parameter. The output includes only the instances that are in either of the specified placement groups.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
    --group-names ML-group HPC-group
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "GroupName": "HPC-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances in a specific placement group

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -GroupName ML-group, HPC-group
```

Example 3: DescribeInstanceTopology - Instance type filter

You can filter by a specified instance type (exact match) or filter by an instance family (using a wildcard). You can also combine a specified instance type filter and instance family filter.

Example 3a – Exact match filter for a specified instance type

AWS CLI

To describe the topology of instances with a specific instance type

Use the describe-instance-topology command with the `instance-type` filter. The output includes only the instances with the specified instance type.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
    --filters Name=instance-type,Values=trn1n.32xlarge
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances with a specific instance type

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="instance-type"; Values="trn1n.32xlarge"}
```

Example 3b – Wild card filter for an instance family

AWS CLI

To describe the topology of instances with a specific instance family

Use the describe-instance-topology command with the `instance-type` filter. The output includes only the instances with the specified instance family.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
    --filters Name=instance-type,Values=trn1*
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-3333333333example",
            "InstanceType": "trn1.32xlarge",
            "NetworkNodes": [
                "nn-1212121212example",
                "nn-1211122211example",
                "nn-1311133311example"
```

```
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az4",
            "AvailabilityZone": "us-west-2d"
        },
        {
            "InstanceId": "i-444444444example",
            "InstanceType": "trn1.2xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-5434334334example",
                "nn-1235301234example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances with a specific instance family

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="instance-type"; Values="trn1*"}
```

Example 3c – Combined instance family and exact match filters

AWS CLI

To describe the topology of instances with an instance family or instance type

Use the describe-instance-topology command with the `instance-type` filter. The output includes only the instances that meet the specified criteria.

```
aws ec2 describe-instance-topology \
    --region us-west-2 \
```

```
    --filters "Name=instance-type,Values=p4d*,trn1n.32xlarge"
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-4343434343example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "usw2-az2",
            "AvailabilityZone": "us-west-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances with an instance family or instance type

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="instance-type"; Values="p4d*", "trn1n.32xlarge"}
```

Example 4: DescribeInstanceTopology - Zone ID filter

You can use the `zone-id` filter to filter by an Availability Zone or Local Zone. You can also combine an Availability Zone filter and Local Zone filter.

Example 4a – Availability Zone filter

AWS CLI

To describe the topology of instances in a specific Availability Zone

Use the describe-instance-topology command with the `zone-id` filter. The output includes only the instances in the specified Availability Zone.

```
aws ec2 describe-instance-topology \
    --region eusc-de-east-1 \
    --filters Name=zone-id,Values=use1-az1
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "use1-az1",
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances in a specific Availability Zone

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="zone-id"; Values="use1-az1"}
```

Example 4b – Local Zone filter

AWS CLI

To describe the topology of instances in a specific Local Zone

Use the describe-instance-topology command with the `zone-id` filter. The output includes only the instances in the specified Local Zone.

```
aws ec2 describe-instance-topology \
    --region eusc-de-east-1 \
    --filters Name=zone-id,Values=use1-atl2-az1
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "use1-atl2-az1",
            "AvailabilityZone": "us-east-1-atl-2a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances in a specific Local Zone

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="zone-id"; Values="use1-atl2-az1"}
```

Example 4c – Combined Availability Zone and Local Zone filters

AWS CLI

To describe the topology of instances in a specific zone

Use the describe-instance-topology command with the `zone-id` filter. The output includes only the instances that are in either of the specified zones.

```
aws ec2 describe-instance-topology \
    --region eusc-de-east-1 \
    --filters Name=zone-id,Values=use1-az1,use1-atl2-az1
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "use1-atl2-az1",
            "AvailabilityZone": "us-east-1-atl-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
```

```
            "CapacityBlockId": "null",
            "ZoneId": "use1-az1",
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances in a specific zone

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="zone-id"; Values="use1-az1", "use1-atl2-az1"}
```

Example 5: DescribeInstanceTopology - Instance type and zone ID filters

You can combine filters in a single command.

AWS CLI

To describe the topology of instances with specific instance types, instance families, and zones

Use the describe-instance-topology command with the `instance-type` and `zone-id` filters. The response contains any instances with either of the specified instance types and are in either of the specified zones.

```
aws ec2 describe-instance-topology \
    --region eusc-de-east-1 \
    --filters "Name=instance-type,Values=p4d*,trn1n.32xlarge" \
              "Name=zone-id,Values=use1-az1,use1-atl2-az1"
```

The following is example output.

```
{
    "Instances": [
        {
            "InstanceId": "i-1111111111example",
            "InstanceType": "p4d.24xlarge",
```

```
            "GroupName": "ML-group",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3333333333example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "use1-atl2-az1",
            "AvailabilityZone": "us-east-1-atl-2a"
        },
        {
            "InstanceId": "i-2222222222example",
            "InstanceType": "trn1n.32xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example",
                "nn-3214313214example"
            ],
            "CapacityBlockId": "null",
            "ZoneId": "use1-az1",
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of instances with specific instance types, instance families, and zones

Use the Get-EC2InstanceTopology cmdlet.

```
Get-EC2InstanceTopology `
    -Filter @{Name="instance-type"; Values="p4d*", "trn1n.32xlarge"} `
            @{Name="zone-id"; Values="use1-az1", "use1-atl2-az1"}
```

Example 6: DescribeCapacityReservationTopology - Capacity Reservation IDs

AWS CLI

To describe the topology of specific Capacity Reservations

Use the describe-capacity-reservation-topology command with the `capacity-reservation-id` parameter. The output includes only the Capacity Reservations that match the specified Capacity Reservation IDs.

```
aws ec2 describe-capacity-reservation-topology \
    --region us-east-1 \
    --capacity-reservation-id cr-1111111111example cr-2222222222example
```

The following is example output.

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-1111111111example",
            "CapacityBlockId": "null",
            "State": "active",
            "InstanceType": "p5.48xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example"
            ],
            "AvailabilityZone": "us-east-1a"
        },
        {
            "CapacityReservationId": "cr-2222222222example",
            "CapacityBlockId": "null",
            "State": "active",
            "InstanceType": "p5en.48xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example"
            ],
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of specific Capacity Reservations

Use the Get-EC2CapacityReservationTopology cmdlet.

```
Get-EC2CapacityReservationTopology `
    -CapacityReservationId cr-1111111111example cr-2222222222example
```

Example 7: DescribeCapacityReservationTopology - Instance type filter

You can filter by a specified instance type (exact match) or filter by an instance family (using a wildcard). You can also combine a specified instance type filter and instance family filter.

AWS CLI

To describe the topology of Capacity Reservations with a specific instance type

Use the describe-capacity-reservation-topology command with the `instance-type` filter. The response contains any instances with the specified instance type.

```
aws ec2 describe-capacity-reservation-topology \
    --region us-east-1 \
    --filters Name=instance-type,Values=p5en.48xlarge
```

The following is example output.

```
{
    "CapacityReservations": [
        {
            "CapacityReservationId": "cr-2222222222example",
            "CapacityBlockId": "null",
            "State": "active",
            "InstanceType": "p5en.48xlarge",
            "NetworkNodes": [
                "nn-1111111111example",
                "nn-2222222222example"
            ],
            "AvailabilityZone": "us-east-1a"
        }
    ],
    "NextToken": "SomeEncryptedToken"
}
```

PowerShell

To describe the topology of Capacity Reservations with a specific instance type

Use the Get-EC2CapacityReservationTopology cmdlet.

```
Get-EC2CapacityReservationTopology `
    -Filter @{Name="instance-type"; Values="p5en.48xlarge"}
```

Placement groups for your Amazon EC2 instances

To meet the needs of your workload, you can launch a group of *interdependent* EC2 instances into a *placement group* to influence their placement.

Depending on the type of workload, you can create a placement group using one of the following placement strategies:

- **Cluster** – Packs instances close together inside an Availability Zone. This strategy enables workloads to achieve the low-latency network performance necessary for tightly coupled node-to-node communication that is typical of high-performance computing (HPC) applications.
- **Partition** – Spreads your instances across logical partitions so that groups of instances in one partition do not share the underlying hardware with groups of instances in different partitions. This strategy is typically used by large distributed and replicated workloads, such as Hadoop, Cassandra, and Kafka.
- **Spread** – Strictly places a small group of instances across distinct underlying hardware to reduce correlated failures.
- **Precision time** – Places instances on supported hardware with direct access to high-precision time sources in AWS infrastructure.

Placement groups are optional. If you don't launch your instances into a placement group, EC2 tries to place the instances in such a way that all of your instances are spread out across the underlying hardware to minimize correlated failures.

Pricing

There is no charge for creating a placement group.

Rules and limitations

Before you use placement groups, be aware of the following rules:

- An instance can be placed in one placement group at a time; you can't place an instance in multiple placement groups.
- You can't merge placement groups.
- On-Demand Capacity Reservations and zonal Reserved Instances allow you to reserve capacity for EC2 instances in Availability Zones. When you launch an instance, if the instance attributes match those specified by an On-Demand Capacity Reservation or a zonal Reserved Instance, then the reserved capacity is automatically used by the instance. This is also true if you launch the instance into a placement group.
- You can't launch Dedicated Hosts in placement groups.
- You can't launch a Spot Instance that is configured to stop or hibernate on interruption in a placement group.

Contents

- Placement strategies for your placement groups
- Create a placement group for your EC2 instances
- Change the placement for an EC2 instance
- Delete a placement group
- Shared placement groups
- Placement groups on AWS Outposts

Placement strategies for your placement groups

You can create a placement group for your EC2 instances using one of the following placement strategies.

Placement strategies

- Cluster placement groups
- Partition placement groups
- Spread placement groups
- Precision time placement groups

Cluster placement groups

A cluster placement group is a logical grouping of instances within a single Availability Zone. Instances are not isolated to a single rack. A cluster placement group can span peered virtual private networks (VPCs) in the same Region. Instances in the same cluster placement group enjoy a higher per-flow throughput limit for TCP/IP traffic and are placed in the same high-bisection bandwidth segment of the network.

The following image shows instances that are placed into a cluster placement group.

Cluster placement groups are recommended for applications that benefit from low network latency, high network throughput, or both. They are also recommended when the majority of the network traffic is between the instances in the group. To provide the lowest latency and the highest packet-per-second network performance for your placement group, choose an instance type that supports enhanced networking. For more information, see Enhanced Networking.

You can ensure that instances launched in a cluster placement group are placed on hardware with precision time capabilities by specifying a parent precision time placement group when you create the cluster placement group. Use the `--parent-group-id` parameter when you create the cluster placement group to establish this relationship.

We recommend that you launch your instances in the following way:

- Use a single launch request to launch the number of instances that you need in the placement group.
- Use the same instance type for all instances in the placement group.

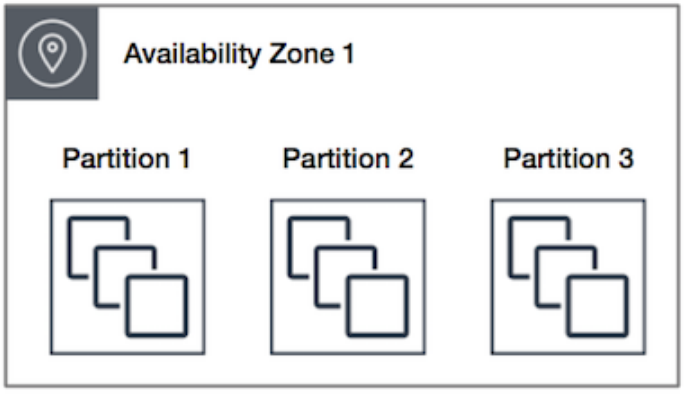
If you try to add more instances to the placement group later, or if you try to launch more than one instance type in the placement group, you increase your chances of getting an insufficient capacity error.

If you stop an instance in a placement group and then start it again, it still runs in the placement group. However, the start fails if there isn't enough capacity for the instance.

If you receive a capacity error when launching an instance in a placement group that already has running instances, stop and start all of the instances in the placement group, and try the launch again. Starting the instances might migrate them to hardware that has capacity for all of the requested instances.

Rules and limitations

The following rules apply to cluster placement groups:



- The following instance types are supported:
  - Current generation instances, except for burstable performance instances (for example, T2) and M7i-flex instances.
  - The following previous generation instances: A1, C3, C4, I2, M4, R3, and R4.
- A cluster placement group can't span multiple Availability Zones.
- The maximum network throughput speed of traffic between two instances in a cluster placement group is limited by the slower of the two instances. For applications with high-throughput requirements, choose an instance type with network connectivity that meets your requirements.
- For instances that are enabled for enhanced networking, the following rules apply:
  - Instances within a cluster placement group can use up to 10 Gbps for single-flow traffic. Instances that are not within a cluster placement group can use up to 5 Gbps for single-flow traffic.
  - Traffic to and from Amazon S3 buckets within the same Region over the public IP address space or through a VPC endpoint can use all available instance aggregate bandwidth.
- You can launch multiple instance types into a cluster placement group. However, this reduces the likelihood that the required capacity will be available for your launch to succeed. We recommend using the same instance type for all instances in a cluster placement group.
- We recommend that you reserve capacity explicitly in the cluster placement group by creating an On-Demand Capacity Reservation in the cluster placement group. Note that you can't reserve capacity using zonal Reserved Instances, as they can't reserve capacity explicitly in a placement group.

- Capacity Blocks do not support placement groups. For more information, see Capacity Blocks for ML.
- Network traffic to the internet and over an Direct Connect connection to on-premises resources is limited to 5 Gbps for cluster placement groups.

Partition placement groups

Partition placement groups help reduce the likelihood of correlated hardware failures for your application. When using partition placement groups, Amazon EC2 divides each group into logical segments called partitions. Amazon EC2 ensures that each partition within a placement group has its own set of racks. Each rack has its own network and power source. No two partitions within a placement group share the same racks, allowing you to isolate the impact of hardware failure within your application.

The following image is a simple visual representation of a partition placement group in a single Availability Zone. It shows instances that are placed into a partition placement group with three partitions—**Partition 1**, **Partition 2**, and **Partition 3**. Each partition comprises multiple instances. The instances in a partition do not share racks with the instances in the other partitions, allowing you to contain the impact of a single hardware failure to only the associated partition.

Partition placement groups can be used to deploy large distributed and replicated workloads, such as HDFS, HBase, and Cassandra, across distinct racks. When you launch instances into a partition placement group, Amazon EC2 tries to distribute the instances evenly across the number of partitions that you specify. You can also launch instances into a specific partition to have more control over where the instances are placed.

A partition placement group can have partitions in multiple Availability Zones in the same Region. A partition placement group can have a maximum of seven partitions per Availability Zone. The

number of instances that can be launched into a partition placement group is limited only by the limits of your account.

In addition, partition placement groups offer visibility into the partitions—you can see which instances are in which partitions. You can share this information with topology-aware applications, such as HDFS, HBase, and Cassandra. These applications use this information to make intelligent data replication decisions for increasing data availability and durability.

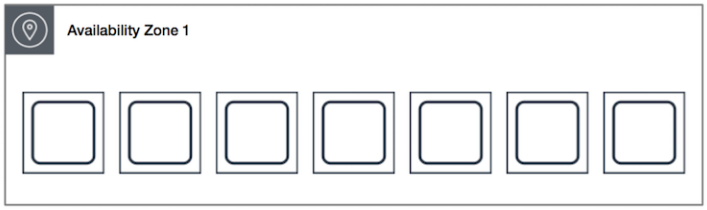
If you start or launch an instance in a partition placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Rules and limitations

The following rules apply to partition placement groups:

- A partition placement group supports a maximum of seven partitions per Availability Zone. The number of instances that you can launch in a partition placement group is limited only by your account limits.
- When instances are launched into a partition placement group, Amazon EC2 tries to evenly distribute the instances across all partitions. Amazon EC2 doesn't guarantee an even distribution of instances across all partitions.
- A partition placement group with Dedicated Instances can have a maximum of two partitions.
- Capacity Reservations do not reserve capacity in a partition placement group.

Spread placement groups



A spread placement group is a group of instances that are each placed on distinct hardware.

Spread placement groups are recommended for applications that have a small number of critical instances that should be kept separate from each other. Launching instances in a spread placement group reduces the risk of simultaneous failures that might occur when instances share the same equipment. Spread placement groups provide access to distinct hardware, and are therefore suitable for mixing instance types or launching instances over time.

If you start or launch an instance in a spread placement group and there is insufficient unique hardware to fulfill the request, the request fails. Amazon EC2 makes more distinct hardware available over time, so you can try your request again later.

Spread placement groups can spread instances across racks or hosts. For more information, see the section called “Placement groups on AWS Outposts”.

The following image shows seven instances in a spread placement group in a single Availability Zone. Each instance is placed on a different rack, where each rack has its own network and power source.

Rules and limitations

The following rules apply to spread placement groups:

- Rack-level spread placement groups are supported in AWS Regions and on AWS Outposts.
- Host-level spread placement groups are only supported on AWS Outposts.
- A rack-level spread placement group can span multiple Availability Zones in the same Region, but it supports a maximum of seven running instances in each Availability Zone.

  For example, in a Region with three Availability Zones, you can run a total of 21 instances in a spread placement group, with seven instances in each Availability Zone. If you try to start an eighth instance in an Availability Zone that already has seven instances, the instance does not launch.

  If you need more than seven instances in an Availability Zone, we recommend that you use multiple spread placement groups. Using multiple spread placement groups does not guarantee that instances are spread across groups, but it does ensure they are spread within each group, which limits the impact of certain classes of failures.
- On AWS Outposts, a rack-level spread placement group can hold as many instances as you have racks in your Outpost deployment, and a host-level spread placement group can hold as many instances as you have hosts.
- Spread placement groups are not supported for Dedicated Instances.
- Capacity Reservations do not reserve capacity in a spread placement group.

Precision time placement groups

A precision time placement group places instances on supported hardware with direct access to high-precision time sources in AWS infrastructure. Instances launched in a precision time placement group can access the enhanced Amazon Time Sync Service, which provides higher-accuracy local time sources compared to the standard local NTP endpoint available to all Amazon EC2 instances.

Precision time placement groups are recommended for applications that require microsecond-accurate clock synchronization, such as distributed databases requiring transaction ordering and consistency, financial services requiring precise timestamping, and distributed systems that order events using local clock readings.

Instances in a precision time placement group benefit from the following:

- An enhanced local NTP time source with improved accuracy, available to all supported operating systems without additional configuration.
- Access to a PTP Hardware Clock (PHC) device for microsecond-accurate synchronization (Linux instances only).
- Hardware packet timestamping for nanosecond-resolution network measurements (Linux instances only).

For information about configuring your instance to use the enhanced time sources, see Set the time reference on your EC2 instance to use the local Amazon Time Sync Service.

The following rules apply to precision time placement groups:

Rules and limitations

- For the current list of supported instance families, see Set the time reference on your EC2 instance to use the local Amazon Time Sync Service.
- If you start or launch an instance in a precision time placement group and there is insufficient hardware to provide access to the enhanced Amazon Time Sync Service, the request fails. Try again later or try a different Availability Zone.
- You can't delete a precision time placement group that is a parent of a cluster placement group.
- There is no additional charge for using precision time placement groups.

Create a placement group for your EC2 instances

You can use a placement group to control the placement of instances relative to each other. After you create a placement group, you can launch instances in the placement group.

Limitation

You can create a maximum of 500 placement groups per Region.

Console

To create a placement group

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Placement Groups**.
3. Choose **Create placement group**.
4. For **Name**, specify a name for the group.
5. For **Placement strategy**, choose the placement strategy for the group: **Cluster**, **Spread**, **Partition**, or **Precision time**.
   a. If you chose **Spread**, for **Spread level**, choose **Host** or **Rack**.
   b. If you chose **Partition**, for **Number of partitions**, enter the number of partitions for the group.
   c. If you chose **Cluster**, you can optionally specify a parent precision time placement group to ensure that instances in the cluster placement group launch on precision time capable hardware.
6. (Optional) To add a tag, under **Tags**, choose **Add new tag**, and then enter a key and value.
7. Choose **Create group**.

AWS CLI

Use the create-placement-group command.

To create a cluster placement group

The following example creates a placement group that uses the `cluster` placement strategy, and it applies a tag with a key of `purpose` and a value of `production`.

```
aws ec2 create-placement-group \
    --group-name my-cluster \
    --strategy cluster \
    --tag-specifications 'ResourceType=placement-
group,Tags={Key=purpose,Value=production}'
```

To create a cluster placement group with a precision time placement group parent

The following example creates a cluster placement group that specifies a parent precision time placement group using the `--parent-group-id` parameter.

```
aws ec2 create-placement-group \
    --group-name my-cluster \
    --strategy cluster \
    --parent-group-id pg-0aaa1111111111111
```

To create a partition placement group

The following example creates a placement group that uses the `partition` placement strategy, and specifies the five partitions using the `--partition-count` parameter.

```
aws ec2 create-placement-group \
    --group-name HDFS-Group-A \
    --strategy partition \
    --partition-count 5
```

To create a precision time placement group

The following example creates a placement group that uses the `precision-time` placement strategy.

```
aws ec2 create-placement-group \
    --group-name my-precision-time-pg \
    --strategy precision-time
```

PowerShell

Use the New-EC2PlacementGroup cmdlet.

To create a cluster placement group

The following example creates a cluster placement group.

```
New-EC2PlacementGroup `
    -GroupName my-placement-group `
    -Strategy cluster
```

To create a cluster placement group with a precision time placement group parent

The following example creates a cluster placement group that specifies a parent precision time placement group using the `-ParentGroupId` parameter.

```
New-EC2PlacementGroup `
    -GroupName my-placement-group `
    -Strategy cluster `
    -ParentGroupId pg-0aaa1111111111111
```

To create a partition placement group

The following example creates a partition placement group.

```
New-EC2PlacementGroup `
    -GroupName my-placement-group `
    -Strategy partition `
    -PartitionCount 5
```

To create a precision time placement group

The following example creates a precision time placement group.

```
New-EC2PlacementGroup `
    -GroupName my-precision-time-pg `
    -Strategy precision-time
```

Change the placement for an EC2 instance

You can change the placement group for an instance as follows:

- Add an instance to a placement group
- Move an instance from one placement group to another

- Remove an instance from a placement group

Requirement

Before you can change the placement group for an instance, the instance must be in the `stopped` state.

Console

To change the instance placement

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Instances**.
3. Select the instance.
4. Choose **Actions**, **Instance settings**, **Modify instance placement**.
5. For **Placement group**, do one of the following:
   - To add the instance to a placement group, choose the placement group.
   - To move the instance from one placement group to another, choose the placement group.
   - To remove the instance from the placement group, choose **None**.
6. Choose **Save**.

AWS CLI

To move an instance to a placement group

Use the following modify-instance-placement command.

```
aws ec2 modify-instance-placement \
    --instance-id i-0123a456700123456 \
    --group-name MySpreadGroup
```

To remove an instance from a placement group

Use the following modify-instance-placement command. When you specify an empty string for the placement group name, this removes the instance from its current placement group.

```
aws ec2 modify-instance-placement \
    --instance-id i-0123a456700123456 \
    --group-name ""
```

PowerShell

To move an instance to a placement group

Use the Edit-EC2InstancePlacement cmdlet with the name of the placement group.

```
Edit-EC2InstancePlacement `
    -InstanceId i-0123a456700123456 `
    -GroupName MySpreadGroup
```

To remove an instance from a placement group

Use the Edit-EC2InstancePlacement cmdlet with an empty string for the name of the placement group.

```
Edit-EC2InstancePlacement `
    -InstanceId i-0123a456700123456 `
    -GroupName ""
```

Delete a placement group

If you need to replace a placement group or no longer need one, you can delete it. Before you can delete a placement group, it must contain no instances. You can terminate the instances, move them to another placement group, or remove them from the placement group.

You can't delete a placement group that is a parent of a cluster placement group. Delete the cluster placement groups first.

Console

To delete a placement group

1. Open the Amazon EC2 console at https://eusc-de-east-1.console.amazonaws-eusc.eu/ec2/.
2. In the navigation pane, choose **Placement Groups**.

3. Select the placement group and choose **Actions**, **Delete**.
4. When prompted for confirmation, enter **`Delete`** and then choose **Delete**.

AWS CLI

To delete a placement group

Use the delete-placement-group command.

```
aws ec2 delete-placement-group --group-name my-cluster
```

PowerShell

To delete a placement group

Use the Remove-EC2PlacementGroup cmdlet.

```
Remove-EC2PlacementGroup -GroupName my-cluster
```

Shared placement groups

Placement group sharing allows you to influence the placement of interdependent instances that are owned by separate AWS accounts. An owner can share a placement group across multiple AWS accounts or within their organization. A participant can launch instances in a placement group that is shared with their account.

A placement group owner can share a placement group with:

- Specific AWS accounts inside or outside of its organization
- An organizational unit inside its organization
- Its entire organization

You can use VPC peering to connect instances owned by separate AWS accounts and get the full latency benefits offered by shared cluster placement groups.

Contents

- Rules and limitations

- Required permissions
- Sharing across Availability Zones
- Placement group sharing
- Placement group unsharing

Rules and limitations

The following rules and limitations apply when you share a placement group or when a placement group is shared with you.

- To share a placement group, you must own it in your AWS account. You can't share a placement group that has been shared with you.
- When you share a partition or spread placement group, the placement group limits do not change. A shared partition placement group supports a maximum of seven partitions per Availability Zone, and a shared spread placement group supports a maximum of seven running instances per Availability Zone.
- To share a placement group with your organization or an organizational unit in your organization, you must enable sharing with AWS Organizations. For more information, see Sharing your AWS resources.
- When using the AWS Management Console to launch an instance, you can select any placement groups that were shared with you. When using the AWS CLI to launch an instance, you must specify a shared placement group by ID, not by name. You can use the name of a placement group only if you're the owner of the shared placement group.
- You are responsible for managing the instances owned by you in a shared placement group.
- You can't view or modify instances and capacity reservations that are associated with a shared placement group but not owned by you.
- The Amazon Resource Name (ARN) of a placement group contains the ID of the account that owns the placement group. You can use the account ID portion of a placement group ARN to identify the owner of a placement group that is shared with you.

Required permissions

To share a placement group, users must have permissions for following actions:

- `ec2:PutResourcePolicy`

- `ec2:DeleteResourcePolicy`

Sharing across Availability Zones

To ensure that resources are distributed across the Availability Zones for a Region, we independently map Availability Zones to names for each account. This could lead to Availability Zone naming differences across accounts. For example, the Availability Zone `us-east-1a` for your AWS account might not have the same location as `us-east-1a` for another AWS account.

To specify the location of your Dedicated Hosts relative to your accounts, you must use the *Availability Zone ID* (AZ ID). The AZ ID is a unique and consistent identifier for an Availability Zone across all AWS accounts. For example, `use1-az1` is an Availability Zone ID for the `us-east-1` Region and it is the same location in every AWS account. For more information, see AZ IDs.

Placement group sharing

To share a placement group, you must add it to a resource share. A resource share is an AWS RAM resource that lets you share your resources across AWS accounts. A resource share specifies the resources to share, and the consumers with whom they are shared.

If you are part of an organization in AWS Organizations, sharing within your organization is enabled, and consumers in your organization are granted access to the shared placement group.

If the placement group is shared with an AWS account outside of your organization, the AWS account owner receives an invitation to join the resource share. They can access the shared placement group after accepting the invitation.

You can share a placement group across AWS accounts using AWS Resource Access Manager. For more information, see Creating a resource share in the *AWS RAM User Guide*.

Placement group unsharing

The placement group owner can unshare a shared placement group at any time. When you unshare a shared placement group, the following changes occur:

- The AWS accounts with which a placement group was shared are no longer able to launch instances or reserve capacity.
- Any instances running in a shared placement group are disassociated from the placement group, but they continue to run in your AWS account.

- Any capacity reservations in a shared placement group are disassociated from the placement group, but remain available to you in your AWS account.

For more information, see Deleting a resource share in the *AWS RAM User Guide*.

Placement groups on AWS Outposts

AWS Outposts is a fully managed service that extends AWS infrastructure, services, APIs, and tools to customer premises. By providing local access to AWS managed infrastructure, AWS Outposts enables customers to build and run applications on premises using the same programming interfaces as in AWS Regions, while using local compute and storage resources for lower latency and local data processing needs.

An Outpost is a pool of AWS compute and storage capacity deployed at a customer site. AWS operates, monitors, and manages this capacity as part of an AWS Region.

You can create placement groups on Outposts that you have created in your account. This allows you to spread out instances across underlying hardware on an Outpost at your site. You create and use placement groups on Outposts in the same way that you create and use placement groups in regular Availability Zones. When you create a placement group with a spread strategy on an Outpost, you can choose to have the placement group spread instances across hosts or racks. Spreading instances across hosts allows you to use a spread strategy with a single-rack Outpost.

Considerations

- A rack-level spread placement group can hold as many instances as you have racks in your Outpost deployment.
- A host-level spread placement group can hold as many instances as you have hosts in your Outpost deployment.

Prerequisite

You must have an Outpost installed at your site. For more information, see Create an Outpost and order Outpost capacity in the *AWS Outposts User Guide*.

To use a placement group on an Outpost

1. Create a subnet on the Outpost. For more information, see Create a subnet in the *AWS Outposts User Guide*.

2. Create a placement group in the associated Region of the Outpost. If you create a placement group with a spread strategy, you can choose host- or rack-level spread to determine how the group spreads instances across the underlying hardware on your Outpost. For more information, see the section called “Create a placement group”.
3. Launch an instance into the placement group. For **Subnet** choose the subnet that you created in Step 1, and for **Placement group name**, select the placement group that you created in Step 2. For more information, see Launch an instance on the Outpost in the *AWS Outposts User Guide*.

Network maximum transmission unit (MTU) for your EC2 instance

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. The larger the MTU of a connection, the more data that can be passed in a single packet. Ethernet frames consist of the packet, or the actual data you are sending, and the network overhead information that surrounds it.

Ethernet frames can come in different formats, and the most common format is the standard Ethernet v2 frame format. It supports 1500 MTU, which is the largest Ethernet packet size supported over most of the internet. The maximum supported MTU for an instance depends on its instance type.

All EC2 instance types support 1500 MTU.

Contents

- Jumbo frames (9001 MTU)

- Troubleshoot

Jumbo frames (9001 MTU)

With jumbo frames, you can increase the payload size per packet, thereby increasing the percentage of the packet that is not packet overhead. With jumbo frames, fewer packets are needed to send the same amount of usable data. However, certain types of traffic are subject to the following maximum payloads:

MTU limit 1500 bytes

- Traffic over an internet gateway
- Traffic over VPN connections
- Traffic between AWS Regions, unless a transit gateway is used

MTU limit 8500 bytes

- Traffic over an inter-region VPC peering connection

If packets are over their MTU limit, they are fragmented, or they are dropped if the `Don't Fragment` flag is set in the IP header.

Jumbo frames should be used with caution for internet-bound traffic or any traffic that leaves a VPC. Packets are fragmented by intermediate systems, which slows down this traffic. To use jumbo frames inside a VPC and not slow traffic that's bound for outside the VPC, you can configure the MTU size by route, or use multiple elastic network interfaces with different MTU sizes and different routes.

For instances that are collocated inside a cluster placement group, jumbo frames help to achieve the maximum network throughput possible, and they are recommended in this case. For more information, see Placement groups for your Amazon EC2 instances.

You can use jumbo frames for traffic between your VPCs and your on-premises networks over Direct Connect. For more information, and for how to verify Jumbo Frame capability, see MTU for private virtual interfaces or transit virtual interfaces in the *Direct Connect User Guide*.

All current generation instance types support jumbo frames. The following previous generation instance types support jumbo frames: A1, C3, I2, M3, and R3.

Related resources

- For NAT gateways, see NAT gateway basics in the *Amazon VPC User Guide*.
- For transit gateways, see Maximum transmission unit in the *Amazon VPC Transit Gateways User Guide*.

- For Outposts see Service link maximum transmission unit requirements in the *AWS Outposts User Guide*.

Path MTU Discovery

Path MTU Discovery (PMTUD) is used to determine the path MTU between two devices. The path MTU is the maximum packet size that's supported on the path between the originating host and the receiving host. When there is a difference in the MTU size in the network between two hosts, PMTUD enables the receiving host to respond to the originating host with an ICMP message. This ICMP message instructs the originating host to use the lowest MTU size along the network path and to resend the request. Without this negotiation, packet drop can occur because the request is too large for the receiving host to accept.

For IPv4, when a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: `Destination Unreachable: Fragmentation Needed and Don't Fragment was Set` (Type 3, Code 4). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

The IPv6 protocol does not support fragmentation in the network. When a host sends a packet that's larger than the MTU of the receiving host or that's larger than the MTU of a device along the path, the receiving host or device drops the packet, and then returns the following ICMP message: `ICMPv6 Packet Too Big (PTB)` (Type 2). This instructs the transmitting host to split the payload into multiple smaller packets, and then retransmit them.

Connections made through some components, like NAT gateways and load balancers, are automatically tracked. This means that security group tracking is automatically enabled for your outbound connection attempts. If connections are automatically tracked, are untracked, or if your security group rules allow inbound ICMP traffic, you can receive PMTUD responses.

Note that ICMP traffic can be blocked even if the traffic is allowed at the security group level, such as if you have a network access control list entry that denies ICMP traffic to the subnet.

> **Important**
>
> Path MTU Discovery does not guarantee that jumbo frames will not be dropped by some routers. An internet gateway in your VPC will forward packets up to 1500 bytes only. 1500 MTU packets are recommended for internet traffic.

For MTU rules over NAT gateways, see Maximum transmission unit (MTU) in the *Amazon VPC User Guide*. For MTU rules over Transit gateways, see Maximum transmission unit (MTU) in the *AWS Transit Gateway User Guide*.

Set the MTU for your Amazon EC2 instances

The maximum transmission unit (MTU) of a network connection is the size, in bytes, of the largest permissible packet that can be passed over the connection. All Amazon EC2 instances support standard frames (1500 MTU) and all current generation instance types support jumbo frames (9001 MTU).

You can view the MTU for your Amazon EC2 instances, view the path MTU between your instance and another host, and configure your instances to use either standard or jumbo frames.

Tasks

- Check the path MTU between two hosts
- Check the MTU for your instance
- Set the MTU for your instance

Check the path MTU between two hosts

You can check the path MTU between your EC2 instance and another host. You can specify a DNS name or an IP address as the destination. If the destination is another EC2 instance, verify that its security group allows inbound UDP traffic.

The procedure that you use depends on the operating system of the instance.

Linux instances

Run the **tracepath** command on your instance to check the path MTU between your EC2 instance and the specified destination. This command is part of the `iputils` package, which is available by default in many Linux distributions.

This example checks the path MTU between the EC2 instance and `amazon.com`.

```
[ec2-user ~]$ tracepath amazon.com
```

In this example output, the path MTU is 1500.

```
 1?: [LOCALHOST]     pmtu 9001
 1:  ip-172-31-16-1.us-west-1.compute.internal (172.31.16.1)   0.187ms pmtu 1500
 1:  no reply
 2:  no reply
 3:  no reply
 4:  100.64.16.241 (100.64.16.241)                             0.574ms
 5:  72.21.222.221 (72.21.222.221)                            84.447ms asymm 21
 6:  205.251.229.97 (205.251.229.97)                          79.970ms asymm 19
 7:  72.21.222.194 (72.21.222.194)                            96.546ms asymm 16
 8:  72.21.222.239 (72.21.222.239)                            79.244ms asymm 15
 9:  205.251.225.73 (205.251.225.73)                          91.867ms asymm 16
...
31:  no reply
     Too many hops: pmtu 1500
     Resume: pmtu 1500
```

Windows instances

To check path MTU using mturoute

1. Download **mturoute.exe** to your EC2 instance from https://elifulkerson.com/projects/mturoute.php.
2. Open a Command Prompt window and change to the directory where you downloaded **mturoute.exe**.
3. Use the following command to check the path MTU between your EC2 instance and the specified destination. This example checks the path MTU between the EC2 instance and `www.elifulkerson.com`.

   ```
   .\mturoute.exe www.elifulkerson.com
   ```

   In this example output, the path MTU is 1500.

   ```
   * ICMP Fragmentation is not permitted. *
   * Speed optimization is enabled. *
   * Maximum payload is 10000 bytes. *
   + ICMP payload of 1472 bytes succeeded.
   - ICMP payload of 1473 bytes is too big.
   Path MTU: 1500 bytes.
   ```

Check the MTU for your instance

You can check the MTU value for your instance. Some instances are configured to use jumbo frames, and others are configured to use standard frame sizes.

The procedure that you use depends on the operating system of the instance.

Linux instances

To check the MTU setting on a Linux instance

Run the following **ip** command on your EC2 instance. If the primary network interface is not `eth0`, replace `eth0` with your network interface.

```
[ec2-user ~]$ ip link show eth0
```

In this example output, *`mtu 9001`* indicates that the instance uses jumbo frames.

```
2: eth0: <BROADCAST,MULTICAST,UP,LOWER_UP> mtu 9001 qdisc pfifo_fast state UP mode
 DEFAULT group default qlen 1000
    link/ether 02:90:c0:b7:9e:d1 brd ff:ff:ff:ff:ff:ff
```

Windows instances

The procedure that you use depends on the driver on your instance.

ENA driver

Version 2.1.0 and later

To get the MTU value, use the following **Get-NetAdapterAdvancedProperty** command on your EC2 instance. Use the wildcard (asterisk) to get all Ethernet names. Check the output for the interface name `*JumboPacket`. A value of 9015 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet*"
```

Version 1.5 and earlier

To get the MTU value, use the following **Get-NetAdapterAdvancedProperty** command on your EC2 instance. Check the output for the interface name `MTU`. A value of 9001 indicates that Jumbo frames are enabled. Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

Intel SRIOV 82599 driver

To get the MTU value, use the following **Get-NetAdapterAdvancedProperty** command on your EC2 instance. Check the entry for the interface name `*JumboPacket`. A value of 9014 indicates that Jumbo frames are enabled. (Note that the MTU size includes the header and the payload.) Jumbo frames are disabled by default.

```
Get-NetAdapterAdvancedProperty -Name "Ethernet"
```

AWS PV driver

To get the MTU value, use the following command on your EC2 instance. The name of the interface can vary. In the output, look for an entry with the name "Ethernet," "Ethernet 2," or "Local Area Connection". You'll need the interface name to enable or disable jumbo frames. A value of 9001 indicates that Jumbo frames are enabled.

```
netsh interface ipv4 show subinterface
```

Set the MTU for your instance

You might want to use jumbo frames for network traffic within your VPC and standard frames for internet traffic. Whatever your use case, we recommend that you verify that your instance behaves as expected.

The procedure that you use depends on the operating system of the instance.

Linux instances

To set the MTU value on a Linux instance

1. Run the following **ip** command on your instance. It sets the desired MTU value to 1500, but you could use 9001 instead. If the primary network interface is not `eth0`, replace `eth0` with the actual network interface.

```
[ec2-user ~]$ sudo ip link set dev eth0 mtu 1500
```

2. (Optional) To persist your network MTU setting after a reboot, modify the following configuration files, based on your operating system type.

   - **Amazon Linux 2023** – Modify the `[Link]` section of the config file. The default config file is `/usr/lib/systemd/network/80-ec2.network`, or you can update any custom config file created in /run/systemd/network/, where the file name is *`priority`*-*`interface`*.network. For more information, see Networking service in the Amazon Linux documentation.

     ```
     MTUBytes=1500
     ```

   - **Amazon Linux 2** – Add the following line to the `/etc/sysconfig/network-scripts/ifcfg-`*`eth0`* file:

     ```
     MTU=1500
     ```

     Add the following line to the `/etc/dhcp/dhclient.conf` file:

     ```
     request subnet-mask, broadcast-address, time-offset, routers, domain-name,
      domain-search, domain-name-servers, host-name, nis-domain, nis-servers, ntp-
     servers;
     ```

   - **Other Linux distributions** – Consult their specific documentation.

3. (Optional) Reboot your instance and verify that the MTU setting is correct.

Windows instances

The procedure that you use depends on the driver on your instance.

ENA driver

You can change the MTU using Device Manager or the **Set-NetAdapterAdvancedProperty** command on your instance.

Version 2.1.0 and later

Use the following command to enable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -
RegistryValue 9015
```

Use the following command to disable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -
RegistryValue 1514
```

Version 1.5 and earlier

Use the following command to enable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -
RegistryValue 9001
```

Use the following command to disable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "MTU" -
RegistryValue 1500
```

Intel SRIOV 82599 driver

You can change the MTU using Device Manager or the **Set-NetAdapterAdvancedProperty** command on your instance.

Use the following command to enable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -
RegistryValue 9014
```

Use the following command to disable jumbo frames.

```
Set-NetAdapterAdvancedProperty -Name "Ethernet" -RegistryKeyword "*JumboPacket" -
RegistryValue 1514
```

AWS PV driver

You can change the MTU using the **netsh** command on your instance. You can't change the MTU using Device Manager.

Use the following command to enable jumbo frames.

```
netsh interface ipv4 set subinterface "Ethernet" mtu=9001
```

Use the following command to disable jumbo frames.

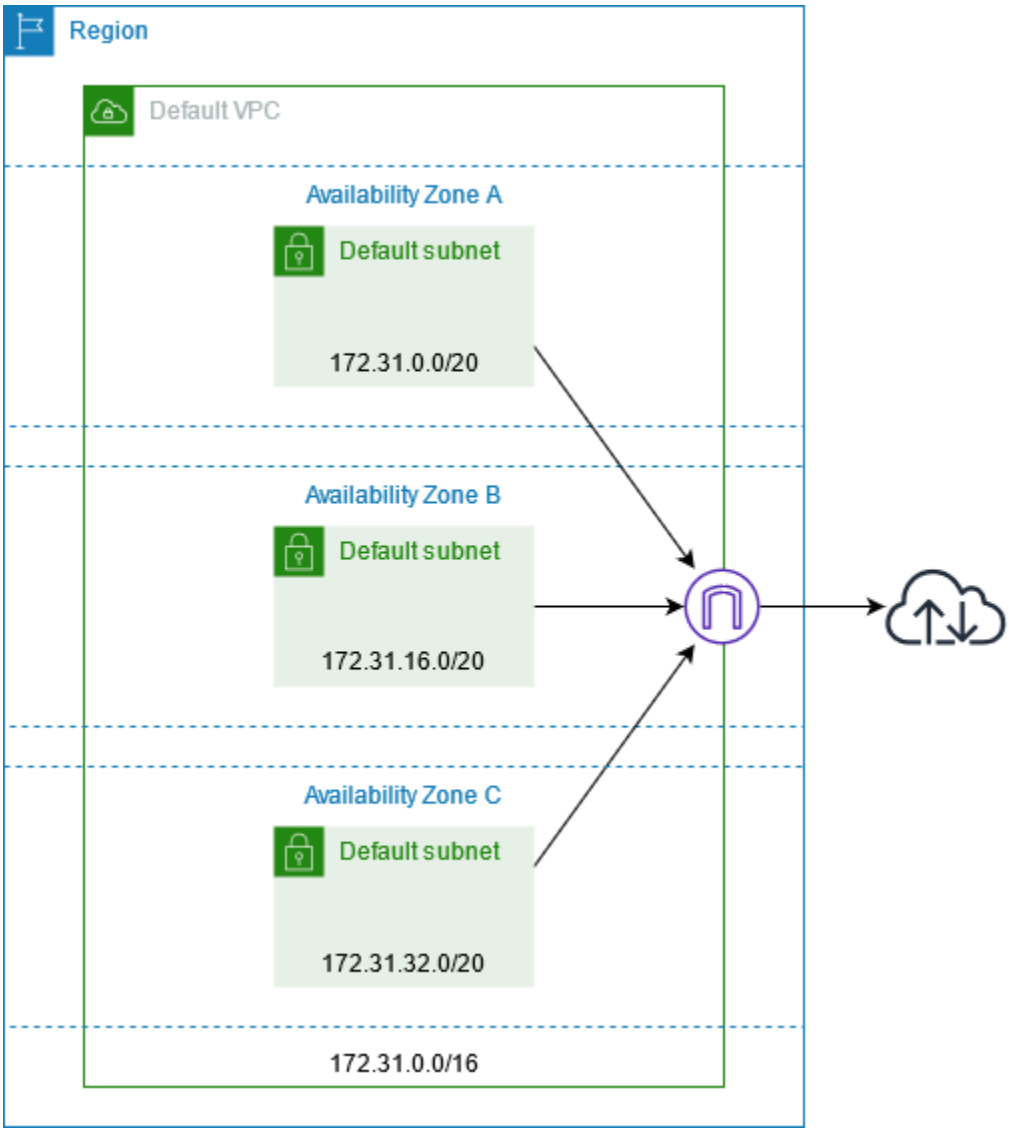
```
netsh interface ipv4 set subinterface "Ethernet" mtu=1500
```

Troubleshoot

If you experience connectivity issues between your EC2 instance and an Amazon Redshift cluster when using jumbo frames, see Queries appear to hang and sometimes fail to reach the cluster in the *Amazon Redshift Management Guide*.

Virtual private clouds for your EC2 instances

Amazon Virtual Private Cloud (Amazon VPC) enables you to define a virtual network in your own logically isolated area within the AWS cloud, known as a *virtual private cloud* or *VPC*. You can create AWS resources, such as Amazon EC2 instances, into the subnets of your VPC. Your VPC closely resembles a traditional network that you might operate in your own data center, with the benefits of using scalable infrastructure from AWS. You can configure your VPC; you can select its IP address range, create subnets, and configure route tables, network gateways, and security settings. You can connect instances in your VPC to the internet or to your own data center.



Contents

- Your default VPCs
- Nondefault VPCs
- Internet access
- Shared subnets
- IPv6-only subnets

Your default VPCs

When you create your AWS account, we create a *default VPC* in each Region. A default VPC is a VPC that is already configured and ready for you to use. For example, there is a default subnet for each Availability Zone in each default VPC, an internet gateway attached to the VPC, and there's a route

in the main route table that sends all traffic (0.0.0.0/0) to the internet gateway. You can modify the configuration of your default VPCs as needed. For example, you can add subnets and route tables.

Nondefault VPCs

Instead of using a default VPC for your resources, you can create your own VPC, as described in Create a VPC in the *Amazon VPC User Guide*.

Here are some things to consider when creating a VPC for your EC2 instances.

- You can use the default suggestion for the IPv4 CIDR block or enter the CIDR block required by your application or network.
- To ensure high availability, create subnets in multiple Availability Zones.
- If your instances must be accessible from the internet, do one of the following:

- If your instances can be in a public subnet, add public subnets. Keep both DNS options enabled. You can optionally add private subnets now or later on.
- If your instances must be in a private subnet, add only private subnets. You can add a NAT gateway to provide internet access to instances in the private subnets. If your instances send or receive a significant volume of traffic across Availability Zones, create a NAT gateway in each Availability Zone. Otherwise, you can create a NAT gateway in just one of the Availability Zones and launch instances that send or receive cross-zone traffic in the same Availability Zone as the NAT gateway.

Internet access

Instances launched into a default subnet in a default VPC have access to the internet, as default VPCs are configured to assign public IP addresses and DNS hostnames, and the main route table is configured with a route to an internet gateway attached to the VPC.

For instances that you launch in nondefault subnets and VPCs, you can use one of the following options to ensure that the instances that you launch in these subnets have access to the internet:

- Configure an internet gateway. For more information, see Connect to the internet using an internet gateway in the *Amazon VPC User Guide*.
- Configure a public NAT gateway. For more information, see Access the internet from a private subnet in the *Amazon VPC User Guide*.

Shared subnets

When launching EC2 instances into shared VPC subnets, note the following:

- Participants can run instances in a shared subnet by specifying the ID of the shared subnet. Participants must own any network interfaces that they specify.
- Participants can start, stop, terminate, and describe instances that they've created in a shared subnet. Participants can't start, stop, terminate, or describe instances that the VPC owner created in the shared subnet.
- VPC owners can't start, stop, terminate, or describe instances created by participants in a shared subnet.
- Participants can connect to an instance in a shared subnet using EC2 Instance Connect Endpoint. The participant must create the EC2 Instance Connect Endpoint in the shared subnet.

Participants can't use an EC2 Instance Connect Endpoint that the VPC owner created in the shared subnet.

For information about shared Amazon EC2 resources, see the following:

- the section called “Shared Capacity Reservations”
- the section called “Shared placement groups”

For more information about shared subnets, see Share your VPC with other accounts in the *Amazon VPC User Guide*.

IPv6-only subnets

An EC2 instance launched in an IPv6-only subnet receives an IPv6 address but not an IPv4 address. Any instances that you launch into an IPv6-only subnet must be Nitro-based instances.

Secondary Networks

Secondary Networks are virtual networks purpose-built for specialized networking use cases. These networks are logically isolated within partitions of the AWS cloud. You can create resources such as secondary subnets within your secondary network. Secondary networks are tightly coupled with Amazon VPCs, such that select instances are multi-homed and launched into both a VPC and a Secondary Network.

Secondary Networks are currently available for select instance types and through capacity reservations with long term commitments. Please reach out to your account team for more information if you think secondary networks may be beneficial for your workload.

Contents

- What are Secondary Networks?
- Key concepts
- Architecture
- Additional considerations

What are Secondary Networks?

Secondary Networks provide a logical, isolated network, used in combination with a VPC network, such that instances are multi-homed into two independent networks. The benefits of secondary networks include:

- High-performance networking for specialized use cases and protocols such as east-west connectivity for ML workloads
- Multi-tenant support with logical isolation
- Instances seamlessly integrate with VPCs and AWS services

Key concepts

Secondary Network

A regional networking construct that provides a logical Layer 3 network with an IPv4 CIDR block (ranging from /28 to /12). Secondary Networks operate independently from VPCs on physically partitioned network infrastructure.

Secondary Subnet

An Availability Zone-specific construct within a Secondary Network, similar to VPC subnets. Secondary Subnets support CIDR blocks ranging from /28 to /12.

Secondary Interface

Network interfaces attached to secondary network cards, providing east-west connectivity within secondary subnets. These interfaces are physically and logically separate from Elastic Network Interfaces (ENIs).

Architecture

EC2 instances that support Secondary Networks are multi-homed, meaning they can communicate within both a VPC and a Secondary Network simultaneously:

- **VPC**: Provides north-south TCP/IP connectivity to AWS services, storage, databases, networking services, and the internet
- **Secondary Network**: Provides east-west connectivity between supported specialized instances

Additional considerations

- Secondary interfaces are managed through RunInstances and they cannot be independently created or deleted.
- Secondary interfaces cannot be attached/detached after the instance is launched.
- Secondary interfaces IP addresses cannot be changed once launched.
- VPC features such as Security Groups, NACLs, Flow Logs are not supported in Secondary Networks.

Getting started

Prerequisites

Before launching instances with Secondary Networks, ensure you have also configured your VPC in the targeted Region and a Subnet in the targeted Availability Zone of your EC2 capacity.

Step 1: Create a Secondary Network

Create a Secondary Network in the same region as your VPC. This is a regional resource that provides logical isolation for your RDMA traffic.

```
aws ec2 create-secondary-network \
  --network-type rdma \
  --ipv4-cidr-block 172.31.0.0/16 \
  --region us-east-2
```

Parameters:

- `--network-type`: Network type (currently only rdma is supported)
- `--ipv4-cidr-block`: IPv4 CIDR block between /28 and /12
- `--region`: AWS Region (US-East-2)

> **Note**
>
> **Best Practice**: Choose a CIDR block that does not overlap with your VPC CIDR to simplify routing at the instance level.

Step 2: Create a Secondary Subnet

Create a Secondary Subnet in the same Availability Zone as your VPC subnet. This is an AZ-specific resource.

```
aws ec2 create-secondary-subnet \
  --secondary-network-id sn-1234567890abcdef0 \
  --ipv4-cidr-block 172.31.24.0/24 \
  --availability-zone us-east-2a
```

> **Note**
>
> **IP Address Reservation**: Like VPC subnets, Amazon reserves the first 4 IP addresses and the last IP address in each Secondary Subnet for internal use.

Step 3: Launch an instance

Launch an instance into both your VPC subnet and Secondary Subnet. The instance will be multi-homed with connectivity to both networks.

```
aws ec2 run-instances \
  --image-id ami-12345678 \
  --count 1 \
  --instance-type <instance> \
  --key-name MyKeyPair \
  --instance-market-options '{"MarketType": "capacity-block"}' \
  --capacity-reservation-specification '{"CapacityReservationTarget": \
  {"CapacityReservationId": "cr-1234567890abcdef0"}}' \
  --network-interfaces \
    "NetworkCardIndex=0,DeviceIndex=0,Groups=sg-12345678,\
    SubnetId=subnet-0987654321fedcba0,InterfaceType=interface" \
  --secondary-interfaces \
    "NetworkCardIndex=1,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
```

```
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=2,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=3,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=4,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=5,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=6,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=7,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true", \
    "NetworkCardIndex=8,DeviceIndex=0,SecondarySubnetId=ss-98765421yxz,\
    InterfaceType=secondary,PrivateIpAddressCount=1,DeleteOnTermination=true"
```

Key Parameters:

- `--network-interfaces`: Specifies the primary Nitro ENI for VPC connectivity (Network Card Index 0)
- `--secondary-interfaces`: Specifies 8 secondary interfaces for east-west connectivity within Secondary Subnets (Network Card Indices 1-8)
- `InterfaceType=secondary`: Indicates a Secondary Interface

Managing Secondary Network resources

Describing Secondary Networks

View details about your Secondary Networks:

```
aws ec2 describe-secondary-networks \
  --secondary-network-id sn-1234567890abcdef0
```

Describing Secondary Subnets

View details about your Secondary Subnets:

```
aws ec2 describe-secondary-subnets \
  --secondary-subnet-id ss-98765421yxz
```

Describing Secondary Interfaces

View details about Secondary Network Interfaces attached to your instances:

```
aws ec2 describe-secondary-interfaces \
  --filters "Name=attachment.instance-id,Values=i-1234567890abcdef0"
```

Deleting resources

Delete a Secondary Subnet:

```
aws ec2 delete-secondary-subnet \
  --secondary-subnet-id ss-98765421yxz
```

Delete a Secondary Network:

```
aws ec2 delete-secondary-network \
  --secondary-network-id sn-1234567890abcdef0
```

> **Important**
>
> You must terminate all instances and delete all Secondary Subnets before deleting a Secondary Network.

Network design best practices

CIDR planning

Avoid Overlapping CIDRs: While Secondary Networks are physically isolated from VPCs, using non-overlapping CIDR blocks simplifies routing configuration at the instance operating system level.

> **Note**
>
> Amazon reserves 5 IP addresses per subnet.

Traffic segregation

Segregate by Secondary Network: Create separate Secondary Networks for different projects, teams, or security boundaries. Secondary Networks provide logical isolation between instances. Instances cannot communicate across different Secondary Networks.

Use Multiple Subnets: Within a Secondary Network, use multiple Secondary Subnets to segment traffic by GPU index, Availability Zone, or workload type. As an example, a common architecture pattern is to deploy a single secondary network with 4 or 8 secondary subnets, where each secondary subnet is aligned to a group of GPUs of common indices.

Troubleshooting

Instance launch failures

Problem: Instance fails to launch with Secondary Network interfaces.

Solutions:

- Verify that your AMI includes proper driver support
- Ensure your Secondary Subnet has sufficient available IP addresses
- Confirm that your capacity reservation is in "active" state
- Check that your Secondary Subnet is in the same Availability Zone as your VPC subnet

Connectivity issues

Problem: Unable to establish RDMA connectivity between instances.

Solutions:

- Verify that all instances are in the same Secondary Network and Secondary Subnet
- Check that secondary interface drivers are properly loaded on the instance
- Ensure that your application is binding to the correct network interfaces
- Instances within the same secondary subnet are reachable through direct routes. Cross subnet communication is available via a static route vended via DHCP.

API errors

Problem: API calls for Secondary Network and Secondary Subnet operations fail.

Solutions:

- Verify IAM permissions for ec2:CreateSecondaryNetwork, ec2:CreateSecondarySubnet.
- Check that CIDR blocks are within the supported range (/28 to /12)
- Verify that you're using the correct Region and Availability Zone

Quotas and limits

To request quota increases, use the AWS Service Quotas or contact AWS Support.

Secondary Networks quotas and limits

Resource	Limit	Adjustable
Secondary Networks per region	5	Yes
Secondary Subnets per Secondary Network	200	Yes
CIDR block size	/28 to /12	No

Security in Amazon EC2

Cloud security at AWS is the highest priority. As an AWS customer, you benefit from a data center and network architecture that are built to meet the requirements of the most security-sensitive organizations.

Security is a shared responsibility between AWS and you. The describes this as security of the cloud and security in the cloud:

- **Security of the cloud** – AWS is responsible for protecting the infrastructure that runs AWS services in the AWS Cloud. AWS also provides you with services that you can use securely. Third-party auditors regularly test and verify the effectiveness of our security as part of the .
- **Security in the cloud** – Your responsibility includes the following areas:
  - Controlling network access to your instances, for example, through configuring your VPC and security groups. For more information, see Controlling network traffic.
  - Managing the credentials used to connect to your instances.
  - Managing the guest operating system and software deployed to the guest operating system, including updates and security patches. For more information, see Update management for Amazon EC2 instances.
  - Configuring the IAM roles that are attached to the instance and the permissions associated with those roles. For more information, see IAM roles for Amazon EC2.

This documentation helps you understand how to apply the shared responsibility model when using Amazon EC2. It shows you how to configure Amazon EC2 to meet your security and compliance objectives. You also learn how to use other AWS services that help you to monitor and secure your Amazon EC2 resources.

Data protection in Amazon EC2

The AWS shared responsibility model applies to data protection in Amazon Elastic Compute Cloud. As described in this model, AWS is responsible for protecting the global infrastructure that runs all of the AWS Cloud. You are responsible for maintaining control over your content that is hosted on this infrastructure. You are also responsible for the security configuration and management tasks for the AWS services that you use. For more information about data privacy, see Data Privacy FAQ. For information about data protection in Europe, see the General Data Protection Regulation (GDPR) Center.

For data protection purposes, we recommend that you protect AWS account credentials and set up individual users with AWS IAM Identity Center or AWS Identity and Access Management (IAM). That way, each user is given only the permissions necessary to fulfill their job duties. We also recommend that you secure your data in the following ways:

- Use multi-factor authentication (MFA) with each account.
- Use SSL/TLS to communicate with AWS resources. We require TLS 1.2 and recommend TLS 1.3.
- Set up API and user activity logging with AWS CloudTrail. For information about using CloudTrail trails to capture AWS activities, see Working with CloudTrail trails in the *AWS CloudTrail User Guide*.
- Use AWS encryption solutions, along with all default security controls within AWS services.
- Use advanced managed security services such as Amazon Macie, which assists in discovering and securing sensitive data that is stored in Amazon S3.
- If you require FIPS 140-3 validated cryptographic modules when accessing AWS through a command line interface or an API, use a FIPS endpoint. For more information about the available FIPS endpoints, see Federal Information Processing Standard (FIPS) 140-3.

We strongly recommend that you never put confidential or sensitive information, such as your customers' email addresses, into tags or free-form text fields such as a **Name** field. This includes when you work with Amazon EC2 or other AWS services using the console, API, AWS CLI, or AWS SDKs. Any data that you enter into tags or free-form text fields used for names may be used for billing or diagnostic logs. If you provide a URL to an external server, we strongly recommend that you do not include credentials information in the URL to validate your request to that server.

- Amazon EBS data security
- Encryption at rest
- Encryption in transit

Amazon EBS data security

Amazon EBS volumes are presented to you as raw, unformatted block devices. These devices are logical devices that are created on the EBS infrastructure and the Amazon EBS service ensures that the devices are logically empty (that is, the raw blocks are zeroed or they contain cryptographically pseudorandom data) prior to any use or re-use by a customer.

If you have procedures that require that all data be erased using a specific method, either after or before use (or both), such as those detailed in **DoD 5220.22-M** (National Industrial Security Program Operating Manual) or **NIST 800-88** (Guidelines for Media Sanitization), you have the ability to do so on Amazon EBS. That block-level activity will be reflected down to the underlying storage media within the Amazon EBS service.

Encryption at rest

EBS volumes

Amazon EBS encryption is an encryption solution for your EBS volumes and snapshots. It uses AWS KMS keys. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

[Windows instances] You can also use Microsoft EFS and NTFS permissions for folder- and file-level encryption.

Instance store volumes

The data on NVMe instance store volumes is encrypted using an XTS-AES-256 cipher, implemented on a hardware module on the instance. The keys used to encrypt data that's written to locally-

attached NVMe storage devices are per-customer, and per volume. The keys are generated by, and only reside within, the hardware module, which is inaccessible to AWS personnel. The encryption keys are destroyed when the instance is stopped or terminated and cannot be recovered. You cannot disable this encryption and you cannot provide your own encryption key.

The data on HDD instance store volumes on H1, D3, and D3en instances is encrypted using XTS-AES-256 and one-time keys.

When you stop, hibernate, or terminate an instance, every block of storage in the instance store volume is reset. Therefore, your data cannot be accessed through the instance store of another instance.

Memory

Memory encryption is enabled on the following instances:

- Instances with AWS Graviton2 or later AWS Graviton processors support always-on memory encryption. The encryption keys are securely generated within the host system, do not leave the host system, and are destroyed when the host is rebooted or powered down. For more information, see AWS Graviton Processors.
- Instances with 3rd generation Intel Xeon Scalable processors (Ice Lake), such as M6i instances, and 4th generation Intel Xeon Scalable processors (Sapphire Rapids), such as M7i instances. These processors support always-on memory encryption using Intel Total Memory Encryption (TME).
- Instances with 3rd generation AMD EPYC processors (Milan), such as M6a instances, and 4th generation AMD EPYC processors (Genoa), such as M7a instances. These processors support always-on memory encryption using AMD Secure Memory Encryption (SME).
- AMD Secure Encrypted Virtualization-Secure Nested Paging (SEV-SNP) is supported for some AMD-based instance types. For more information, see Find EC2 instance types that support AMD SEV-SNP.

Encryption in transit

Encryption at the physical layer

All data flowing across AWS Regions over the AWS global network is automatically encrypted at the physical layer before it leaves AWS secured facilities. All traffic between AZs is encrypted.

Additional layers of encryption, including those listed in this section, may provide additional protections.

Encryption provided by Amazon VPC peering and Transit Gateway cross-Region peering

All cross-Region traffic that uses Amazon VPC peering and Transit Gateway peering is automatically bulk-encrypted when it exits a Region. An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

Encryption between instances

AWS provides secure and private connectivity between EC2 instances of all types. In addition, some instance types use the offload capabilities of the underlying Nitro System hardware to automatically encrypt in-transit traffic between instances. This encryption uses Authenticated Encryption with Associated Data (AEAD) algorithms, with 256-bit encryption. There is no impact on network performance. To support this additional in-transit traffic encryption between instances, the following requirements must be met:

- The instances use the following instance types:
  - **General purpose**: M5dn, M5n, M5zn, M6a, M6i, M6id, M6idn, M6in, M7a, M7g, M7gd, M7i, M7i-flex, M8a, M8azn, M8g, M8gb, M8gd, M8gn, M8i, M8id, M8i-flex, M8in, M8idn, M8ine, M8ib, M8idb, M9g, M9gd, Mac-m4, Mac-m4pro, T8i
  - **Compute optimized:** C5n, C6a, C6gn, C6i, C6id, C6in, C7a, C7g, C7gd, C7gn, C7i, C7i-flex, C8a, C8g, C8gb, C8gd, C8gn, C8i, C8id, C8i-flex, C8in, C8ine, C8ib, C9g, C9gd
  - **Memory optimized:** R5dn, R5n, R6a, R6i, R6id, R6idn, R6in, R7a, R7g, R7gd, R7i, R7iz, R8a, R8g, R8gb, R8gd, R8gn, R8i, R8id, R8i-flex, R8in, R8idn, R8ib, R8idb, R9g, R9gd, U-3tb1, U-6tb1, U-9tb1, U-12tb1, U-18tb1, U-24tb1, U7i-6tb, U7i-8tb, U7i-12tb, U7in-16tb, U7in-24tb, U7in-32tb, U7inh-32tb, X2idn, X2iedn, X2iezn, X8g, X8aedz, X8i
  - **Storage optimized:** D3, D3en, I3en, I4g, I4i, I7i, I7ie, I8g, I8ge, Im4gn, Is4gen
  - **Accelerated computing:** DL1, DL2q, F2, G4ad, G4dn, G5, G6, G6e, G6f, Gr6, Gr6f, G7, G7e, Inf1, Inf2, P3dn, P4d, P4de, P5, P5e, P5en, P6-B200, P6-B300, P6e-GB200, Trn1, Trn1n, Trn2, Trn2u, VT1
  - **High-performance computing:** Hpc6a, Hpc6id, Hpc7a, Hpc7g, Hpc8a
- The instances are in the same Region.
- The instances are in the same VPC or peered VPCs, and the traffic does not pass through a virtual network device or service, such as a load balancer or a transit gateway.

An additional layer of encryption is automatically provided at the physical layer for all traffic before it leaves AWS secured facilities, as previously noted in this section.

To view the instance types that encrypt in-transit traffic between instances using the AWS CLI

Use the following describe-instance-types command.

```
aws ec2 describe-instance-types \
    --filters Name=network-info.encryption-in-transit-supported,Values=true \
    --query "InstanceTypes[*].[InstanceType]" \
    --output text | sort
```

Encryption to and from AWS Outposts

An Outpost creates special network connections called *service links* to its AWS home Region and, optionally, private connectivity to a VPC subnet that you specify. All traffic over those connection is fully encrypted. For more information, see Connectivity through service links and Encryption in transit in the *AWS Outposts User Guide*.

Remote access encryption

The SSH and RDP protocols provides secure communications channels for remote access to your instances, whether directly or through EC2 Instance Connect. Remote access to your instances using AWS Systems Manager Session Manager or the Run Command is encrypted using TLS 1.2, and requests to create a connection are signed using SigV4, and authenticated and authorized by AWS Identity and Access Management.

It is your responsibility to use an encryption protocol, such as Transport Layer Security (TLS), to encrypt sensitive data in transit between clients and your Amazon EC2 instances.

(Windows instances) Make sure to allow only encrypted connections between EC2 instances and the AWS API endpoints or other sensitive remote network services. You can enforce this through an outbound security group or Windows Firewall rules.

Infrastructure security in Amazon EC2

As a managed service, Amazon Elastic Compute Cloud is protected by AWS global network security. For information about AWS security services and how AWS protects infrastructure, see AWS Cloud Security. To design your AWS environment using the best practices for infrastructure security, see Infrastructure Protection in *Security Pillar AWS Well-Architected Framework*.

You use AWS published API calls to access Amazon EC2 through the network. Clients must support the following:

- Transport Layer Security (TLS). We require TLS 1.2 and recommend TLS 1.3.
- Cipher suites with perfect forward secrecy (PFS) such as DHE (Ephemeral Diffie-Hellman) or ECDHE (Elliptic Curve Ephemeral Diffie-Hellman). Most modern systems such as Java 7 and later support these modes.

For more information, see Infrastructure Protection in the *Security Pillar – AWS Well-Architected Framework*.

Network isolation

A virtual private cloud (VPC) is a virtual network in your own logically isolated area in the AWS Cloud. Use separate VPCs to isolate infrastructure by workload or organizational entity.

A subnet is a range of IP addresses in a VPC. When you launch an instance, you launch it into a subnet in your VPC. Use subnets to isolate the tiers of your application (for example, web, application, and database) within a single VPC. Use private subnets for your instances if they should not be accessed directly from the internet.

To call the Amazon EC2 API from your VPC using private IP addresses, use AWS PrivateLink. For more information, see Access Amazon EC2 using an interface VPC endpoint.

Isolation on physical hosts

Different EC2 instances on the same physical host are isolated from each other as though they are on separate physical hosts. The hypervisor isolates CPU and memory, and the instances are provided virtualized disks instead of access to the raw disk devices.

When you stop or terminate an instance, the memory allocated to it is scrubbed (set to zero) by the hypervisor before it is allocated to a new instance, and every block of storage is reset. This ensures that your data is not unintentionally exposed to another instance.

Network MAC addresses are dynamically assigned to instances by the AWS network infrastructure. IP addresses are either dynamically assigned to instances by the AWS network infrastructure, or assigned by an EC2 administrator through authenticated API requests. The AWS network allows instances to send traffic only from the MAC and IP addresses assigned to them. Otherwise, the traffic is dropped.

By default, an instance cannot receive traffic that is not specifically addressed to it. If you need to run network address translation (NAT), routing, or firewall services on your instance, you can disable source/destination checking for the network interface.

Controlling network traffic

Consider the following options for controlling network traffic to your EC2 instances:

- Restrict access to your instances using security groups. Configure rules that allow the minimum required network traffic. For example, you can allow traffic only from the address ranges for your corporate network or only for specific protocols, such as HTTPS. For Windows instances, allow Windows management traffic and minimal outbound connections.
- Leverage security groups as the primary mechanism for controlling network access to Amazon EC2 instances. When necessary, use network ACLs sparingly to provide stateless, coarse-grain network control. Security groups are more versatile than network ACLs due to their ability to perform stateful packet filtering and create rules that reference other security groups. However, network ACLs can be effective as a secondary control for denying a specific subset of traffic or providing high-level subnet guard rails. Also, because network ACLs apply to an entire subnet, they can be used as defense-in-depth in case an instance is ever launched unintentionally without a correct security group.
- [Windows instances] Centrally manage Windows Firewall settings with Group Policy Objects (GPO) to further enhance network controls. Customers often use the Windows Firewall for further visibility into network traffic and to complement security group filters, creating advanced rules to block specific applications from accessing the network or to filter traffic from a subset IP addresses. For example, the Windows Firewall can limit access to the EC2 metadata service IP address to specific users or applications. Alternatively, a public-facing service might use security groups to restrict traffic to specific ports and the Windows Firewall to maintain a list of explicitly blocked IP addresses.
- Use private subnets for your instances if they should not be accessed directly from the internet. Use a bastion host or NAT gateway for internet access from an instance in a private subnet.
- [Windows instances] Use secure administration protocols like RDP encapsulation over SSL/TLS. The Remote Desktop Gateway Quick Start provides best practices for deploying remote desktop gateway, including configuring RDP to use SSL/TLS.
- [Windows instances] Use Active Directory or Directory Service to tightly and centrally control and monitor interactive user and group access to Windows instances, and avoid local user permissions. Also avoid using Domain Administrators and instead create more granular,

application-specific role-based accounts. Just Enough Administration (JEA) allows changes to Windows instances to be managed without interactive or administrator access. In addition, JEA enables organizations to lock down administrative access to the subset of Windows PowerShell commands required for instance administration. For additional information, see Best Practices for Security, Identity, & Compliance.

- [Windows instances] System Administrators should use Windows accounts with limited access to perform daily activities, and only elevate access when necessary to perform specific configuration changes. Additionally, only access Windows instances directly when absolutely necessary. Instead, leverage central configuration management systems such as EC2 Run Command, Systems Center Configuration Manager (SCCM), Windows PowerShell DSC, or Amazon EC2 Systems Manager (SSM) to push changes to Windows servers.
- Configure Amazon VPC subnet route tables with the minimal required network routes. For example, place only Amazon EC2 instances that require direct Internet access into subnets with routes to an internet gateway, and place only Amazon EC2 instances that need direct access to internal networks into subnets with routes to a virtual private gateway.
- Consider using additional security groups or network interfaces to control and audit Amazon EC2 instance management traffic separately from regular application traffic. This approach allows customers to implement special IAM policies for change control, making it easier to audit changes to security group rules or automated rule-verification scripts. Using multiple network interfaces also provides additional options for controlling network traffic, including the ability to create host-based routing policies or leverage different VPC subnet routing rules based on the assigned subnet of the network interface.
- Use AWS Virtual Private Network or Direct Connect to establish private connections from your remote networks to your VPCs. For more information, see Network-to-Amazon VPC Connectivity Options.
- Use VPC Flow Logs to monitor the traffic that reaches your instances.
- Use GuardDuty Malware Protection to identify suspicious behavior indicative of malicious software on your instances that might compromise your workload, repurpose resources for malicious use, and gain unauthorized access to your data.
- Use GuardDuty Runtime Monitoring to identify and respond to potential threats to your instances. For more information, see How Runtime Monitoring works with Amazon EC2 instances.
- Use AWS Security Hub CSPM, Reachability Analyzer, or Network Access Analyzer to check for unintended network accessibility from your instances.
- Use EC2 Instance Connect to connect to your instances using Secure Shell (SSH) without the need to share and manage SSH keys.

- Use AWS Systems Manager Session Manager to access your instances remotely instead of opening inbound SSH or RDP ports and managing key pairs.
- Use AWS Systems Manager Run Command to automate common administrative tasks instead of connecting to your instances.
- [Windows instances] Many of the Windows OS roles and Microsoft business applications also provide enhanced functionality such as IP Address Range restrictions within IIS, TCP/IP filtering policies in Microsoft SQL Server, and connection filter policies in Microsoft Exchange. Network restriction functionality within the application layer can provide additional layers of defense for critical business application servers.

Amazon VPC supports additional network security controls, such as gateways, proxy servers, and network monitoring options. For more information, see Control network traffic in the *Amazon VPC User Guide*.

Resilience in Amazon EC2

The AWS global infrastructure is built around AWS Regions and Availability Zones. Regions provide multiple physically separated and isolated Availability Zones, which are connected through low-latency, high-throughput, and highly redundant networking. With Availability Zones, you can design and operate applications and databases that automatically fail over between zones without interruption. Availability Zones are more highly available, fault tolerant, and scalable than traditional single or multiple data center infrastructures.

If you need to replicate your data or applications over greater geographic distances, use AWS Local Zones. An AWS Local Zone is an extension of an AWS Region in geographic proximity to your users. Local Zones have their own connections to the internet and support Direct Connect. Like all AWS Regions, AWS Local Zones are completely isolated from other AWS Zones.

If you need to replicate your data or applications in an AWS Local Zone, AWS recommends that you use one of the following zones as the failover zone:

- Another Local Zone
- An Availability Zone in the Region that is not the parent zone. You can use the describe-availability-zones command to view the parent zone.

For more information about AWS Regions and Availability Zones, see AWS Global Infrastructure.

In addition to the AWS global infrastructure, Amazon EC2 offers the following features to support your data resiliency:

- Copying AMIs across Regions
- Copying EBS snapshots across Regions
- Automating EBS-backed AMIs using Amazon Data Lifecycle Manager
- Automating EBS snapshots using Amazon Data Lifecycle Manager
- Maintaining the health and availability of your fleet using Amazon EC2 Auto Scaling
- Distributing incoming traffic across multiple instances in a single Availability Zone or multiple Availability Zones using Elastic Load Balancing

Compliance validation for Amazon EC2

To learn whether an AWS service is within the scope of specific compliance programs, see AWS services in Scope by Compliance Program and choose the compliance program that you are interested in. For general information, see AWS Compliance Programs.

You can download third-party audit reports using AWS Artifact. For more information, see Downloading Reports in AWS Artifact.

Your compliance responsibility when using AWS services is determined by the sensitivity of your data, your company's compliance objectives, and applicable laws and regulations. For more information about your compliance responsibility when using AWS services, see AWS Security Documentation.

Identity and access management for Amazon EC2

AWS Identity and Access Management (IAM) is an AWS service that helps an administrator securely control access to AWS resources. IAM administrators control who can be *authenticated* (signed in) and *authorized* (have permissions) to use Amazon EC2 resources. IAM is an AWS service that you can use with no additional charge.

Your security credentials identify you to services in AWS and grant you access to AWS resources, such as your Amazon EC2 resources. You can use features of Amazon EC2 and IAM to allow other users, services, and applications to use your Amazon EC2 resources without sharing your security credentials. You can use IAM to control how other users use resources in your AWS account, and

you can use security groups to control access to your Amazon EC2 instances. You can choose to allow full or limited use of your Amazon EC2 resources.

If you are a developer, you can use IAM roles to manage the security credentials needed by the applications that you run on your EC2 instances. After you attach an IAM role to your instance, your applications running on the instance can retrieve the credentials from the Instance Metadata Service (IMDS).

For best practices for securing your AWS resources using IAM, see Security best practices in IAM in the *IAM User Guide*.

Contents

- Example policies to control access to the Amazon EC2 console
- AWS managed policies for Amazon EC2
- IAM roles for Amazon EC2

Identity-based policies for Amazon EC2

By default, users don't have permission to create or modify Amazon EC2 resources, or perform tasks using the Amazon EC2 API, Amazon EC2 console, or CLI. To allow users to create or modify resources and perform tasks, you must create IAM policies that grant users permission to use the specific resources and API actions they'll need, and then attach those policies to the users, groups, or IAM roles that require those permissions.

When you attach a policy to a user, group of users, or role it allows or denies the users permission to perform the specified tasks on the specified resources. For more general information about IAM policies, see Policies and permissions in IAM in the *IAM User Guide*. For more information about managing and creating IAM policies, see Manage IAM policies.

An IAM policy must grant or deny permissions to use one or more Amazon EC2 actions. It must also specify the resources that can be used with the action, which can be all resources, or in some cases, specific resources. The policy can also include conditions that you apply to the resource.

To get started, you can check whether the AWS managed policies for Amazon EC2 meet your needs. Otherwise, you can create your own custom policies. For more information, see the section called “AWS managed policies”.

Contents

- Policy syntax
- Actions for Amazon EC2
- Supported resource-level permissions for Amazon EC2 API actions
- Amazon Resource Names (ARNs) for Amazon EC2
- Condition keys for Amazon EC2
- Control access using attribute-based access
- Grant permissions to users, groups, and roles
- Check that users have the required permissions

Policy syntax

An IAM policy is a JSON document that consists of one or more statements. Each statement is structured as follows.

```
{
  "Statement":[{
    "Effect":"effect",
    "Action":"action",
    "Resource":"arn",
    "Condition":{
      "condition":{
        "key":"value"
        }
      }
    }
  ]
}
```

There are various elements that make up a statement:

- **Effect:** The *effect* can be `Allow` or `Deny`. By default, users don't have permission to use resources and API actions, so all requests are denied. An explicit allow overrides the default. An explicit deny overrides any allows.
- **Action**: The *action* is the specific API action for which you are granting or denying permission. To learn about specifying *action*, see Actions for Amazon EC2.

- **Resource**: The resource that's affected by the action. Some Amazon EC2 API actions allow you to include specific resources in your policy that can be created or modified by the action. You specify a resource using an Amazon Resource Name (ARN) or using the wildcard (*) to indicate that the statement applies to all resources. For more information, see Supported resource-level permissions for Amazon EC2 API actions.
- **Condition**: Conditions are optional. They can be used to control when your policy is in effect. For more information about specifying conditions for Amazon EC2, see Condition keys for Amazon EC2.

For more information about policy requirements, see the IAM JSON policy reference in the *IAM User Guide*. For example IAM policy statements for Amazon EC2, see Example policies to control access the Amazon EC2 API.

Actions for Amazon EC2

In an IAM policy statement, you can specify any API action from any service that supports IAM. For Amazon EC2, use the following prefix with the name of the API action: `ec2:`. For example: `ec2:RunInstances` and `ec2:CreateImage`.

To specify multiple actions in a single statement, separate them with commas as follows:

```
"Action": ["ec2:action1", "ec2:action2"]
```

You can also specify multiple actions using wildcards. For example, you can specify all actions whose name begins with the word "Describe" as follows:

```
"Action": "ec2:Describe*"
```

> **Note**
>
> Currently, the Amazon EC2 Describe* API actions do not support resource-level permissions. For more information about resource-level permissions for Amazon EC2, see Identity-based policies for Amazon EC2.

To specify all Amazon EC2 API actions, use the * wildcard as follows:

```
"Action": "ec2:*"
```

For a list of Amazon EC2 actions, see Actions defined by Amazon EC2 in the *Service Authorization Reference*.

Supported resource-level permissions for Amazon EC2 API actions

Resource-level permissions refers to the ability to specify which resources users are allowed to perform actions on. Amazon EC2 has partial support for resource-level permissions. This means that for certain Amazon EC2 actions, you can control when users are allowed to use those actions based on conditions that have to be fulfilled, or specific resources that users are allowed to use. For example, you can grant users permissions to launch instances, but only of a specific type, and only using a specific AMI.

To specify a resource in an IAM policy statement, use its Amazon Resource Name (ARN). For more information about specifying the ARN value, see Amazon Resource Names (ARNs) for Amazon EC2. If an API action does not support individual ARNs, you must use a wildcard (*) to specify that all resources can be affected by the action.

To see tables that identify which Amazon EC2 API actions support resource-level permissions, and the ARNs and condition keys that you can use in a policy, see Actions, resources, and condition keys for Amazon EC2.

Keep in mind that you can apply tag-based resource-level permissions in the IAM policies you use for Amazon EC2 API actions. This gives you better control over which resources a user can create, modify, or use. For more information, see Grant permission to tag Amazon EC2 resources during creation.

Amazon Resource Names (ARNs) for Amazon EC2

Each IAM policy statement applies to the resources that you specify using their ARNs.

An ARN has the following general syntax:

```
arn:aws-eusc:[service]:[region]:[account-id]:resourceType/resourcePath
```

service

The service (for example, `ec2`).

region

The Region for the resource (for example, `eusc-de-east-1`).

account-id

The AWS account ID, with no hyphens (for example, `123456789012`).

resourceType

The type of resource (for example, `instance`).

resourcePath

A path that identifies the resource. You can use the * wildcard in your paths.

For example, you can indicate a specific instance (`i-1234567890abcdef0`) in your statement using its ARN as follows.

```
"Resource": "arn:aws-eusc:ec2:eusc-de-east-1:123456789012:instance/i-1234567890abcdef0"
```

You can specify all instances that belong to a specific account by using the * wildcard as follows.

```
"Resource": "arn:aws-eusc:ec2:eusc-de-east-1:123456789012:instance/*"
```

You can also specify all Amazon EC2 resources that belong to a specific account by using the * wildcard as follows.

```
"Resource": "arn:aws-eusc:ec2:eusc-de-east-1:123456789012:*"
```

To specify all resources, or if a specific API action does not support ARNs, use the * wildcard in the `Resource` element as follows.

```
"Resource": "*"
```

Many Amazon EC2 API actions involve multiple resources. For example, `AttachVolume` attaches an Amazon EBS volume to an instance, so a user must have permissions to use the volume and the instance. To specify multiple resources in a single statement, separate their ARNs with commas, as follows.

```
"Resource": ["arn1", "arn2"]
```

For a list of ARNs for Amazon EC2 resources, see Resource types defined by Amazon EC2.

Condition keys for Amazon EC2

In a policy statement, you can optionally specify conditions that control when it is in effect. Each condition contains one or more key-value pairs. Condition keys are not case-sensitive. We've defined AWS global condition keys, plus additional service-specific condition keys.

For a list of service-specific condition keys for Amazon EC2, see Condition keys for Amazon EC2. Amazon EC2 also implements the AWS global condition keys. For more information, see Information available in all requests in the *IAM User Guide*.

All Amazon EC2 actions support the `aws:RequestedRegion` and `ec2:Region` condition keys. For more information, see Example: Restrict access to a specific Region.

To use a condition key in your IAM policy, use the `Condition` statement. For example, the following policy grants users permission to add and remove inbound and outbound rules for any security group. It uses the `ec2:Vpc` condition key to specify that these actions can only be performed on security groups in a specific VPC.

JSON

```
{
"Version":"2012-10-17",
  "Statement":[{
    "Effect":"Allow",
    "Action": [
       "ec2:AuthorizeSecurityGroupIngress",
       "ec2:AuthorizeSecurityGroupEgress",
       "ec2:RevokeSecurityGroupIngress",
       "ec2:RevokeSecurityGroupEgress"],
     "Resource": "arn:aws-eusc:ec2:eusc-de-east-1:111122223333:security-group/*",
      "Condition": {
        "StringEquals": {
          "ec2:Vpc": "arn:aws-eusc:ec2:eusc-de-east-1:111122223333:vpc/
vpc-11223344556677889"
        }
      }
    }
  ]
}
```

If you specify multiple conditions, or multiple keys in a single condition, we evaluate them using a logical AND operation. If you specify a single condition with multiple values for one key, we evaluate the condition using a logical OR operation. For permissions to be granted, all conditions must be met.

You can also use placeholders when you specify conditions. For more information, see IAM policy elements: Variables and tags in the *IAM User Guide*.

> **Important**
>
> Many condition keys are specific to a resource, and some API actions use multiple resources. If you write a policy with a condition key, use the `Resource` element of the statement to specify the resource to which the condition key applies. If not, the policy may prevent users from performing the action at all, because the condition check fails for the resources to which the condition key does not apply. If you do not want to specify a resource, or if you've written the `Action` element of your policy to include multiple API actions, then you must use the `...IfExists` condition type to ensure that the condition key is ignored for resources that do not use it. For more information, see ...IfExists Conditions in the *IAM User Guide*.

Condition keys

- ec2:Attribute condition key
- ec2:ResourceID condition keys
- ec2:SourceInstanceARN condition key

ec2:Attribute condition key

The `ec2:Attribute` condition key can be used for conditions that filter access by an attribute of a resource.

This condition key supports only properties that are of a primitive data type (such as strings or integers), or complex **AttributeValue** objects that contain only a **Value** property (such as the **Description** or **ImdsSupport** objects of the ModifyImageAttribute API action). The condition key can't be used with complex objects that contain multiple properties, such as the **LaunchPermission** object of ModifyImageAttribute.

For example, the following policy uses the `ec2:Attribute/Description` condition key to filter access by the complex **Description** object of the **ModifyImageAttribute** API action. The condition key allows only requests that modify an image's description to either `Production` or `Development`.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:ModifyImageAttribute",
      "Resource": "arn:aws-eusc:ec2:eusc-de-east-1::image/ami-*",
      "Condition": {
        "StringEquals": {
          "ec2:Attribute/Description": [
            "Production",
            "Development"
          ]
        }
      }
    }
  ]
}
```

The following example policy uses the `ec2:Attribute` condition key to filter access by the primitive **Attribute** property of the **ModifyImageAttribute** API action. The condition key denies all requests that attempt to modify an image's description.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Deny",
      "Action": "ec2:ModifyImageAttribute",
      "Resource": "arn:aws-eusc:ec2:eusc-de-east-1::image/ami-*",
```

```
      "Condition": {
        "StringEquals": {
          "ec2:Attribute": "Description"
        }
      }
    }
  ]
}
```

ec2:ResourceID condition keys

When using the following `ec2:`*`Resource`*`ID` condition keys with the specified API actions, the condition key value is used to specify the resulting resource that is created by the API action. `ec2:`*`Resource`*`ID` condition keys can't be used to specify a source resource that is specified in the API request. If you use one of the following `ec2:`*`Resource`*`ID` condition keys with a specified API, then you must always specify the wildcard (*). If you specify a different value, the condition always resolves to * during runtime. For example, to use the `ec2:ImageId` condition key with the **CopyImage** API, then you must specify the condition key as follows:

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:CopyImage",
      "Resource": "arn:aws-eusc:ec2:eusc-de-east-1::image/ami-*",
      "Condition": {
        "StringEquals": {
          "ec2:ImageID": "*"
        }
      }
    }
  ]
}
```

We recommend that you avoid using these condition keys with these API actions:

- ec2:DhcpOptionsID – CreateDhcpOptions
- ec2:ImageID – CopyImage, CreateImage, ImportImage, and RegisterImage
- ec2:InstanceID – RunInstances and ImportInstance
- ec2:InternetGatewayID – CreateInternetGateway
- ec2:NetworkAclID – CreateNetworkAcl
- ec2:NetworkInterfaceID – CreateNetworkInterface
- ec2:PlacementGroupName – CreatePlacementGroup
- ec2:RouteTableID – CreateRouteTable
- ec2:SecurityGroupID – CreateSecurityGroup
- ec2:SnapshotID – CopySnapshot, CreateSnapshot, CreateSnapshots, and ImportSnapshots
- ec2:SubnetID – CreateSubnet
- ec2:VolumeID – CreateVolume and ImportVolume
- ec2:VpcID – CreateVpc
- ec2:VpcPeeringConnectionID – CreateVpcPeeringConnection

To filter access based on specific resource IDs, we recommend that you use the Resource policy element as follows.

JSON

```
{
  "Version":"2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": "ec2:CopyImage",
      "Resource": "arn:aws-eusc:ec2:eusc-de-east-1::image/ami-01234567890abcdef"
    }
  ]
}
```

ec2:SourceInstanceARN condition key

Use `ec2:SourceInstanceARN` to specify the ARN of the instance from which a request is made. This is an AWS global condition key, which means that you can use it with services other than Amazon EC2. For a policy example, see Example: Allow a specific instance to view resources in other AWS services.

Control access using attribute-based access

When you create an IAM policy that grants users permission to use EC2 resources, you can include tag information in the `Condition` element of the policy to control access based on tags. This is known as attribute-based access control (ABAC). ABAC provides better control over which resources a user can modify, use, or delete. For more information, see What is ABAC for AWS?

For example, you can create a policy that allows users to terminate an instance, but denies the action if the instance has the tag `environment=production`. To do this, you use the `aws:ResourceTag` condition key to allow or deny access to the resource based on the tags that are attached to the resource.

```
"StringEquals": { "aws:ResourceTag/environment": "production" }
```

To learn whether an Amazon EC2 API action supports controlling access using the `aws:ResourceTag` condition key, see Actions, resources, and condition keys for Amazon EC2. Note that the `Describe` actions do not support resource-level permissions, so you must specify them in a separate statement without conditions.

For example IAM policies, see Example policies to control access the Amazon EC2 API.

If you allow or deny users access to resources based on tags, you must consider explicitly denying users the ability to add those tags to or remove them from the same resources. Otherwise, it's possible for a user to circumvent your restrictions and gain access to a resource by modifying its tags.

Grant permissions to users, groups, and roles

To provide access, add permissions to your users, groups, or roles:

- Users and groups in AWS IAM Identity Center:

  Create a permission set. Follow the instructions in Create a permission set in the *AWS IAM Identity Center User Guide*.

- Users managed in IAM through an identity provider:

  Create a role for identity federation. Follow the instructions in Create a role for a third-party identity provider (federation) in the *IAM User Guide*.
- IAM users:
  - Create a role that your user can assume. Follow the instructions in Create a role for an IAM user in the *IAM User Guide*.
  - (Not recommended) Attach a policy directly to a user or add a user to a user group. Follow the instructions in Adding permissions to a user (console) in the *IAM User Guide*.

Check that users have the required permissions

After you've created an IAM policy, we recommend that you check whether it grants users the permissions to use the particular API actions and resources they need before you put the policy into production.

First, create a user for testing purposes, and then attach the IAM policy that you created to the test user. Then, make a request as the test user.
